THE dendrobiums will be rapidly completing their season's growth. It would be well to have a system of removing them gradually to the resting-house, by which there would be no check. Examine them twice a-week, and those fully grown sponge with soft-soap water and remove to the intermediate-house. Others that have been removed to the house earlier can be taken into the vinery or any structure convenient that will answer the purpose, after which the water must be gradually decreased. Avoid extremes, and do not keep them too dry nor yet drown them with the hose-pipe. Such treatment has a tendency to produce black spot, with which growers are generally troubled in this section. A certain amount of thought and judgment is required. The best course to obtain good flowering plants is to have sound, well-ripened, stout bulbs, these to be kept in a plump state throughout their resting season. The deciduous species, such as Wardianum, heterocarpum, Bensoniæ, macrophyllum, Devonianum and many others, ought to shed their leaves in a natural manner, those belonging to the evergreen section ought to be just the reverse, and retain their leaves. A large proportion of orchidists have practised growing the plants throughout the winter months the same as the summer, with a view to obtaining larger plants in a shorter time, or with a view to propagation. This method is satisfactory so far as it goes, but on the other hand, providing flowers are required, the resting plan must be adopted and strictly adhered to. Sometimes it will be found at an old-established place, amongst the collection of various plants, a large specimen of Dendrobium nobile, which has been grown for a considerable number of years in the same place and entirely under the same treatment year after year, during which time there has been comparatively few flowers produced; eventually the advice of a grower is sought, and a rest is recommended, which, of course, proves a great success. The bulbs that have been growing for so many years are all well ripened and all ready and willing to make a display. When the season comes and the flowers are produced the grower is quite satisfied that such a specimen in such conditions never existed before, so must find its way to the various local exhibitions. This is a proof of the importance of resting dendrobiums.

Lælia anceps, mostly among the dark varieties, will be producing their spikes; others will be earlier and growing fast. It is advisable to put thin, neat stakes to them in order to protect them from being broken, as in lifting baskets down from the roof for watering purposes and rehanging them we are apt to break them; a slight sponge over with weak soft soap water now and then will prevent any scale lodging on the leaves or in the axils; a fumigation of X L All will also be a preventive to green fly, which very often troubles us during the growing season of the flower spikes, and, lastly, affects and disfigures the flowers. Vandas of the tricolor and sauvis section are grown in some collections; if any are leggy and dwarf plants are desired they may be cut down and dropped into a pot within a few inches of the base of the bottom leaves, that is, providing the roots are convenient to do so; if not, they may be dropped accordingly in order to have dwarfer plants, allowing them plenty of crocks and moss; nothing else is required; they must be kept in a shady place until something like established; the hot rays of the sun which we often have at this time of the year must be guarded against strictly, in order to keep the leaves in a healthy state. The damping and watering generally will require discretion; plenty of fresh air on favourable occasions, as stagnant air at this season is bad among orchids; a little more fire heat will be required at night to dry up the stagnant moisture. The cattleyas must be examined, and where any rot is lodging cut away the bulb; keep a sharp eye on the cattleya fly; fumigate occasionally to kill the insects; very little will act, they being so fragile.—T. STAFFORD, *Tyntesfield Gardens.*

STOVE PLANTS.

GREATER care will be required in ventilating these structures now in order to avoid cold draughts, which mean a severe check to the plants feeling it. More reliance will need to be placed upon the heating apparatus to keep up the necessary night temperature. At this season the careful and thoughtful stoker can best show his abilities; if the night has been cold, and it has been necessary to push the fire to have the necessary heat in the pipes, he will so bank up his fire that, if the morning should prove to be bright and promise a hot day, he can easily have his pipes cooled before the hottest part of the day, keeping his fire low and clean ready for starting it on again to meet the declining sun heat. The morning syringing may with advantage be performed later than has been the rule, though the floors and stages of the house will need to be damped first thing upon turning out in the morning; the afternoon syringing to be performed not later than two p.m., damping the floors again before going in to tea. The same remarks apply to the intermediate house; a little air may be left on the top ventilators in this structure on all but very cold nights.

Batches of gloxinias, achimenes, and tydæas, as they pass out of flower, place on a shelf in the full sun and gradually reduce the supply of water, withholding altogether when the shoots are thoroughly dried; when this is attained the pots may be stored away in a dry place free from drip, where the temperature in the hardest weather does not fall below 45 or 50 degrees. Caladiums, after being dried off, must be wintered in the stove, as the tubers will not stand a low temperature. Those who have experienced difficulty with the latter, when allowing them to remain in the pots in which they were grown during the preceding season, may try the plan of turning them out of their pots, shaking the tubers free from soil, and placing them singly in small pots with a little dry sand.

Ixoras that have done flowering will require a reduced supply of water, and may be stood at the coolest end of the house; those that are still flowering to be afforded weak stimulants occasionally. Afford water less freely to dipladenias, as they show signs of passing out of flower, the shoots also may receive a light thinning. Plants of Gesnera zebrina and others that are coming into flower should be afforded stimulants regularly—not strong—weak and often being the policy with these and other things requiring feeding; be careful not to wet the foliage, else it will become spotted and lose much of its beauty. Later batches may be potted into their flowering pots, using a compost of loam, peat, leaf-soil, well-decayed manure, and sand; six-inch is a suitable sized pot to flower them in. Late batches of justicias that have been growing in cool frames should be removed to the intermediate house—if they remain longer in cool quarters they will lose their foliage—the same remarks apply to Thyrsacanthus rutilans. As the plants of Urceolina pendula aurea come into flower, they should be associated with ferns, it adding very much to their beauty as they lose their leaves before their flowers appear. Bougainvillias that have done flowering should have their shoots well thinned out, but defer pruning for some time yet. All stove plants that have been used in the conservatory should be removed to the stove without further delay; if kept in the cool temperature longer they will suffer.

In the fernery it will be necessary to reduce the atmospheric moisture; should thrips be present in the house they will be likely to increase with the reduced moisture, therefore, fumigate two or three nights in succession with XL All fumigating compound, to be repeated again in the course of a week, so that they may be quite eradicated. With the reduction of atmospheric moisture greater care will be necessary in watering, so that none suffer from a lack of moisture at the roots.

Gloriosas, after flowering, should be gradually dried off, and when the tubers are quite mature (which will be when the shoots and foliage are quite ripened off), store the pots away in a dry place in a temperature of 60 degrees. Attend regularly to cleaning and sponging any plants infested with mealy-bug and scale; plants cannot progress satisfactorily where these are allowed to thrive.—J. TUNNINGTON, *Ripley Castle Gardens, Yorks.*

THE FLOWER GARDEN.

THE continued dry weather and extreme heat is playing sad havoc with the occupants of herbaceous borders under ordinary culture, and it rarely occurs that these are so situated where water may be applied in quantity and often, which has been very necessary this season to preserve a fresh and growing condition. Although a loose surface helps considerably to counteract drought by forming a kind of dusty mulching, the earth has become so hot and parched that many subjects are showing distress, and if flowers are desired later, water and an additional mulch should be applied if possible, the past week having added considerably to the distressing drought, and water supplies are in many instances used up. Border chrysanthemums, so useful through the early part of October, should receive some assistance or the flowers will be poor should the foliage suffer to any extent. Several are already in bloom, one of the best of these being the showy golden yellow Flora, a variety that continues to produce young flowering shoots from the old wood until really cut down by several degrees of frost. Some other varieties flowering are Canari (dwarf bright yellow), Bronze Bride, Mons. Gustave Gunnerwald, Mrs. Selby, Illustration, and Harvest Home, which may be described as an early flowering William Holmes, and a very desirable variety.

Michaelmas daisies in several varieties are also being forced into bloom by the extreme heat, and watering will be necessary with the tall growers to preserve the lower foliage. These are so useful for supplying cut flowers that their culture deserves extension. Nothing is more showy now than masses of the purple blue of the variety Amellus bessarabicus—about two feet in height, the foliage perfect, and where no water has been given—the white of Harpur Crewe, and the pale lilac of Cordifolius, Acris, and others. These should be tied loosely to stakes if not already done, or heavy storms of wind and rain, which we may expect sometime this or next month, will break them down. Sunflowers, Pyrethrum uliginosum, and others should also be afforded support. Phygelius capensis is one of the brightest dwarf-flowering subjects in the borders at the present time; it seems to stand the drought well and flowers freely. Dahlias in light soils have had a very trying time recently, although where well mulched and watered occasionally the flowers have been good. While these are in bloom the collection should be examined and correctly named, or the colour and description placed on a label to be attached to the root when lifted for storing later on. The second flowering of roses has, through the dry conditions above cited, been somewhat poorer than usual, the growths made being thin and weakly. One of the best dry weather roses is the old Gloire de Dijon, which has yielded a wealth of blossoms notwithstanding the drought; and some of the teas, as Anna Olivier, Madame Lambard, Marie Van Houtte, have furnished some fairly good flowers.

Carnation layers that have been regularly watered since layering will have become sufficiently rooted to allow of their being severed from the parent plant within the next week or two, to be either replanted in a permanent position for flowering next season, or to be potted up and kept in cold frames during the winter. In all light soils border carnations are best planted in the open early in autumn. In clayey, wet soils in cold localities it may be necessary to winter them in cold frames, to be planted out in the spring, but the less cooling the plants receive the better. The positions of the beds for the carnations should be changed annually, if possible, and also be prepared beforehand by deep digging, adding fresh loam or thoroughly decayed manure if the ground is in a poor condition. In planting, a space of not less than a foot apart each way should be given.—C. HERRIN, *Dropmore Gardens.*

HARDY FRUITS.

OWING to the long protracted drought and heat in the southern parts of the country, many of the late apples are dropping their fruits in large numbers. This is to be regretted, as the crop in many districts is none too plentiful, and if the fruits are gathered too early they will not keep. Birds are most troublesome this season with the best coloured fruits, and in many cases it has been necessary to net the trees; at the same time I am not much in favour of placing nets so close to the frnits that the strain of the nets makes an impression. In the case of fine fruits, I have used tiffany with advantage. Small trees that have well coloured fruits, are covered with this material, but it is not well to cover so closely that the air cannot circulate freely. Small bush trees will repay copious supplies of moisture if in light soil, as these are mostly on the Paradise stock, which is a surface rooter, and the later varieties will need assistance to mature the fruits. Liquid manure may still be given the last-named, and if a mulch was applied as previously advised, the trees will perfect the crop, and late apples this year will be limited in quantity. Pears will pay for similar attention. Trees on the quince stock have shallow roots, and will need liberal supplies of moisture to enable them to perfect their fruit. I fear in many gardens the crops of both apples and pears this year are light, and lack size, so that feeding of trees should not be overlooked, even when the crops are cleared. As the soil is so dry the trees need moisture to build up the fruit buds for another season.

No liquid from cow yards or stables should be allowed to run to waste at this season as it is needed in so many different ways. Apricots are feeling the effects of drought in our light soil, and I am doubly anxious as it often occurs. We lose much wood the next spring after a hot, dry summer, and this in a measure may be prevented by watering and mulching. The same remarks apply to cherries on warm walls; these trees are needing more than ordinary attention, as, like the apricot, they root near the surface and need ample support. Newly-planted trees have had a trying time when planted early in the year and every endeavour should be made to keep the leaves on the trees, as if they drop prematurely the bark shrivels and it is difficult to induce the trees to grow vigorously another year. I advised special culture for these trees early in the summer and need not reiterate the advice given, but I would add that should the mulch need renewal do not hesitate to apply fresh material, as this is more necessary now than earlier, before the leaf growth was so large. Recently-planted trees bearing heavy crops should have a portion of the fruit removed as it is not well to exhaust the trees unduly, and at this date the fruits may be made good use of. In the case of early kinds the crop may be cleared and the trees given ample supplies of moisture once a week at least.

The fruit store or room, as it is often called, should be put in order before the crop is taken in. Of course, ere this some early fruits will have been gathered, but

I usually give these a cooler room, if possible, as unfortunately many fruit rooms at this date are none too cool late in the day, and fruits will keep much longer in a cellar or underground compartment than in a heated fruit room, which is often placed at the back of forcing or hot houses. Any store place that is cool and not too dry will be suitable at this season, and the best store I ever had was an old disued ice well fitted up with shelves, and here we had no difficulty in keeping apples till May. With rooms above ground much may done by having the roof thatched or the spaces between the slates and ceiling to the depth of a foot filled in with some non-conducting material, such as sawdust. Another point is, too much ventilation, as this is not so much needed if a cool temperature can be maintained, and free currents of air tend to cause shrivelling. But, of course, no matter what kind of store be employed fruits gathered too early will not keep plump and in otherwise first-rate condition. In the case of such excellent kinds ot dessert fruit as Cox's Orange and Ribston Pippin apples, far better gather late than lose the good qualities of the fruit. In many fruit rooms fires and pipes were considered necessary adjuncts to the fitting, they are the reverse, and providing frost can be kept out that will suffice.—G. WYTHES, *Syon Gardens.*

THE APPLE CROP.

Berwick.—I am very pleased to be able to report that with me this year apples are a splendid crop, Ecklinville, Warner's King, Hoary Morning, Lord Derby, Duchess of Oldenburgh, Aitkin's No. 2, and many others; we have a very large collection of, both on walls and bush trees. Fruit is much larger this year than it has been for a few years past; largest and finest I have seen for a long time, owing to the warm weather we had in the second half of August and beginning of September. Ground here very heavy. We are fully a fortnight behind a little further south. Dessert apples a splendid crop.—JAMES FOSTER, *Paxton House.*

Bucks.—Some varieties are bearing excellent crops, whilst others are a failure. The following are a good crop, although rather below the average in size owing to the dry weather: Gladstone, Ingestre (Yellow), Worcester Pearmain, White Transparent, Washington, Ribston Pippin, Seaton House, Mrs. Barron, Newton Wonder, Keswick Codlin, Lane's Prince Albert, King of the Pippins, Kerry Pippin, Duchess of Oldenburgh, Ecklinville Seedling, Gascoyne's Scarlet, Cockle Pippin, Cox's Orange Pippin, Baumann's Red Winter Reinnette, Adams' Pearmain, Cobham, and Margil.—J. SMITH, *Mentmore.*

Cheshire.—Apples bloomed very abundantly, but as is too often the case we were visited with cold winds and some frost when the fruit was setting, the result being that some trees have no fruit, some a few, and several bearing good crops, but on the whole the crop is scarcely an average one. The kinds bearing best are the following: Irish Peach, Worcester Pearmain, Cox's Orange Pippin, Dutch Mignonne, Baumann's Red Winter Reinette, Royal Russet, Ribston Pippin, Cox's Pomona, Chatley's Kernel, Ecklinville Seedling (fine fruit), Warner's King (good), Bismarck, Grenadier, Pott's Seedling, Lane's Prince Albert, Lord Suffield, Frogmore Prolific, Lord Grosvenor, Mère de Menage or Combermere, Kentish Codlin, Hawthornden, Northern Greening, and Keswick Codlin.—W. WHITAKER, *Crewe Hall.*

Cornwall.—A very good crop, the following varieties especially so: Astrachan, I find it very good on Paradise stock, colours very nicely, would sell well; Bismarck (mine are young trees), good on any stock, fine variety; Beauty of Kent, splendid for kitchen, not for dessert; Blenheim Pippin, a good old variety, always bears well after the first few years; Bramley's Seedling does well on any stock, and generally bears good crop; Cox's Orange Pippin and King of the Pippin, the two best dessert apples grown, always bear a good crop, and good colour; Devonshire Quarrenden, very good in a nice dry soil; Grenadier, the best of the Codlins with me; Irish Peach, nice early dessert, sure bearer; Newton Wonder, good late kitchen variety; Ribston Pippin, on Paradise stock, is very good, cannot grow it on any other as it cankers; Sturmer Pippin, splendid late apple for any purpose; Yellow Ingestre, small but very good dessert apple. The above are some of the best for this soil; some good varieties I cannot grow because of canker.—S. J. RICHARDS, *Mount Edgecumbe.*

Denbighshire.—There is an average crop. Ribston Pippin, good; Blenheim Pippin, good; Golden Noble, extra fine; Lord Suffield was a scanty crop but fruits very fine; Lady Sudeley is an excellent variety and does well here; Ecklinville Seedling fruits are heavy; Court Pendu Plât, Gloria Mundi, Fearn's Pippin, Hawthornden, and Wareham Russets are a fair average crop.—HENRY FORDER, *Ruthin Castle Gardens.*

Derby.—Apples are a somewhat partial crop, the fruit generally undersized, and some varieties are badly grub-eaten and scabby. Most of the Codlin varieties are bearing average crops of clean fruit; Blenheim Pippin is bearing well, also Cox's Orange Pippin. That never-failing variety, Lane's Prince Albert, is bearing its usual heavy burden; many of the early varieties are good, such as Irish Peach, Lady Sudeley, Duchess of Oldenburg, Juneating; of late varieties, Tower of Glamis, Burchard's Seedling, and Wareham Russet are well loaded. We have young trees of Allen's Everlasting, Wealthy, Gascoyne's Scarlet, Bismarck, &c., heavily laden with good clean fruit.—J. H. GOODACRE, *Elvaston Castle.*

Dumbartonshire.—Apples are a fair crop, and the most productive varieties are: King of Pippins, Warner's King, Ecklinville, and Lord Suffield, of which we have good crops.—W. MCHUTCHEON, *Auchendennan.*

Fifeshire.—We grow about twenty varieties, and Irish Peach, Ecklinville, Warner's King, Aitken's No. 2, East Lothian Seedling, have always produced a good crop for the past fifteen years; all others are very uncertain bearers.—JOHN CLARK, *Wemyss Castle Gardens.*

Hants.—Apples are a fair crop in this district, such sorts as the early dessert kinds, namely, Irish Peach, Lady Sudeley, Mr. Gladstone, and Red Juneating, are bearing good crops. Of later sorts, the heaviest crop are carried by Worcester Pearmain, Blenheim Pippin, Cox's Pomona, Cox's Orange Pippin, Ribston Pippin, Adams' Pearmain, Cockle's Pippin. Those carrying a fair crop are Mannington's Pearmain, Peasgood's Nonsuch, Mother Apple, Rosemary Russet, Fearn's Pippin, Emperor Alexander, Scarlet Nonpareil, Reinette du Canada, Sturmer Pippin, Allen's Everlasting, King of Pippins. The best early kitchen apples are Duchess of Oldenburg, Manks Codlin, and Keswick Codlin. Of later sorts with good crop are Cellini, Northern Dumpling, Ecklinville, Stirling Castles Hawthornden, The Queen, Lord Derby, Warner's King, Wellington, Lane'r Prince Albert, Norfolk Beefing, Bramley's Seedling, Winter Queening, Winte, Peach, Alfriston, Northern Greening, French Crab, Sandringham, Calville Rouge, Beauty of Kent, Chelmsford Wonder, Tower of Glamis, King of Tompkins County, Gravenstein.—J. W. MCHATTIE, *Strathfieldsaye.*

—The apple crop in this locality is considerably below the average, which must, I think, be attributed to the sharp frosts and cold winds we experienced late in spring. Birds are now very troublesome in this neighbourhood, especially blackbirds, and are destroying a great proportion of the fruit now hanging on the trees. Through the drought there is no food for them, and apples, plums, pears, outdoor figs, and even tomatos are devoured, unless securely netted. Our best dessert apples are Irish Peach and Worcester Pearmain early, followed by Cox's Orange Pippin, King of the Pippins, Blenheim Orange, Ribston Pippin, Court of Wick, and Sturmer Pippin. Best culinary are Frogmore Prolific, Lord Suffield, Golden Noble, Blenheim Pippin, Cox's Pomona, and Winter Belle Bonne; this last is a first-rate variety, good in quality, and keeping perfectly sound till the end of April.—G. TRINDER, *Dogmersfield Gardens.*

Kent.—The crop of apples is a good average. With the exception of Suffields most varieties are carrying a very fair crop. Amongst the best sorts that I have found to be the most reliable are the following: Ecklinville, this seldom fails us, but this year it has been extra good, not only for size but for the enormous quantity of fruit carried; being short-jointed it makes a very compact and pretty bush tree. Golden Spire, very heavy cropper, one of the very best culinary apples we have, should be in every garden, and certainly where room is limited; being an erect grower it can be planted eight feet apart or even less; when carrying a heavy crop we begin thinning the fruits when about the size of a hen's egg, and we are still picking from a tree that we commenced upon a month since. Grenadier, another grand apple worth growing; heavy cropper, makes a very nice tree. Then for later use we find Stones a really splendid sort; a good robust grower, heavy cropper, and capital cooker. Warner's King another reliable sort; Golden Noble, very nice shapely apple, good cropper, perfectly round, shallow eye, no waste in peeling; Queen Caroline, much like the foregoing, not such a good keeper, makes a pretty tree, in colour a lovely yellow; Lane's Prince Albert, very heavy bearer, needs much thinning to get the fruit good sized; a good late kind. Newton Wonder, this is a splendid late kind, a cross, I believe, between Blenheim and Wellington. Messrs. Pearson, of Chilwell, I see are bringing the merits of this sort before the public, and certainly it deserves all the publicity possible. Amongst dessert kinds Lady Sudeley ranks very high with me as an early kind; Mr. Gladstone I find a poor cropper, after this year I shall cease to grow it. Worcester Pearmain is another very desirable early variety, very heavy cropper; loses flavour within a day or two after being gathered, but eaten direct from the tree it is not to be despised. I have just seen some bushes four to five feet in height carrying three to four dozen highly-coloured fruits. Ribstons and Cox's Orange are good, but owing to the drought are not so large as usual. Wealthy has done well with me for several years; a very bright and attractive fruit, seems to me one that would make a good market apple. Owing to the continued drought we have experienced for weeks apples, and especially pears, are rather smaller than usual.—GEORGE WOODWARD, *Barham Court.*

Kirkcudbright.—Apples are very poor with us this season. The varieties bearing the finest crops are: Keswick Codling, Nonsuch, Lord Suffield, Hawthornden, Ecklinville, Nonpareil, King of Pippins, Early Harvest, and Ribston Pippin.—JAMES HANNAH, *Cairnsmore Gardens.*

Meath.—We had plenty of bloom, but owing to severe weather the flowers failed to set, consequently we have a very indifferent crop of apples.—JAMES HOUNSLOW, *Headfort Gardens, Kells.*

Middlesex.—Apples this season throughout this district are but a partial crop; in some places fairly good, in others very thin. Some gardens and orchards have been better favoured than others. Trees looked very promising in early spring, but what with the continued east winds and prolonged drought the crop here is almost a failure. We have a perfect plague of wasps and flies, which are compelling us to gather fruit before it is properly ripe, as they are devouring everything.—A. R. ALLAN, *Hillingdon Court Gardens.*

Norfolk.—On young trees good; older trees, owing to the dryness of the subsoil, are looking bad, and have dropped their fruit—where they have retained the fruit it is small, and of poor quality. The rainfall in May, with two or three copious downfalls since, accompanied with lightning, has kept the surface fairly moistened during the growing season, but the total absence of rainfall during the winter accounts for the miserable plight of the older trees.—W. ALLAN, *Gunton Park.*

Northamptonshire.—Varieties most prolific and those on which I depend are Lord Suffield, River's Codlin, Warner's King, Bismarck, Worcester Pearmain, Cellini Pippin, Small's Admirable, Schoolmaster, New Hawthornden, Blenheim Pippin, Mr. Gladstone, Beauty of Bath, Kerry Pippin, Irish Peach, Lady Sudeley, King of the Pippins, Court Pendu Plât, Annie Elizabeth, and Peter the Great; these are all bearing an average crop. The following are generally less prolific on our limestone sub-soil: Ecklinville Seedling, Keswick Codlin (prolific in most places), Cox's Orange Pippin, Quarrenden, Bramley's Seedling, Tower of Glamis, Alfriston, with others; even if they set, the fruit falls with a spell of hot weather. Taking the crop on the whole, it is far above the average.—JOHN HAYES, *Castle Ashby.*

Northumberland.—Orchard trees are nearly a failure here this season. Bush trees on the Paradise in the gardens are heavily cropped. The soil is poor. The site for every tree is carefully prepared; a layer of clay is placed nearly two feet deep, three inches thick, and a little is mixed with any good soil there is to spare, also lime rubbish to keep it sweet. Only few branches are grown on the trees; these, well set with fruit spurs, frequently bear crops as much as the tree can mature. Kitchen apples, Red Calville, Codlins, Domino, perhaps the heaviest cropping apple; Lord Grosvenor, great cropper; Ecklinville, exceptionally fine this year; these will maintain a supply till November; Stirling Castle, great cropper; Warner's King, to Christmas; Lane's Prince Albert, Bramley's Seedling, Newton Wonder, Dumelow's Seedling, four of the best for late use. Of dessert apples in the open in bush form Mr. Gladstone, Lady Sudeley, and Worcester Pearmain good; Irish Peach, Early Harvest, James Grieve, Red Astrachan, Cox's Orange Pippin, and Ribston do excellently on walls, but not as open bushes. For the garden, I am altogether in favour of the bush form on the Paradise stock. The frost in spring does not injure the dwarf bush so much as it does the tall orchard tree.—GEORGE HARRIS, *Alnwick Castle Gardens.*

Tipperary.—The apple crop is very much under the average here, a very unfavourable month of May working havoc among fruit trees. Northern Dumpling and Cox's Pomona, however, are carrying a full crop, both being in [illegible] situations. The finest dessert apples, as Red Astrachan, Kerry Pippin, &c., are few and far between this year. There are over 30 varieties of standard apples, and the trees indeed look barren as compared with 1896.—D. R. [illegible], *[illegible] Gardens, Templemore.*

Queen's County.—Apples are a full crop. Codlin varieties, especially Ecklinville Seedling, Keswick Codlin, Manks Codlin, and Queen Caroline, are first-rate in every way. Warner's King is also very fine. The trees are well sheltered with a high wall on the north side.—W. BEGBIE, *Emo Park.*

Radnorshire.—The varieties of apples which have cropped the best in this garden are Ecklinville Seedling, heavy crop; Golden Spire, Bramley's Seedling, Emperor Alexander, Lord Derby, Cox's Pomona, King of the Pippins, Alfriston, Ribston Pippin, Lord Grosvenor, all are a good average. Blenheim Pippin, Tower of Glamis, Cox's Orange Pippin, Lord Suffield, and several other sorts have scarcely any crop. The first ten seem to succeed the best here, Ecklinville always cropping freely and the fruit attains a large size; one drawback to it is that the fruit becomes spotted, which disfigures it very much.—W. PALLISER, *Norton Manor.*

Rutland.—All kinds flowered well, but the crop is only a partial one. It is impossible to assign a reason for the failure this season of some kinds and the success of others, as the trees were not overcropped last year, and we had no frost while they were in flower. Mr. Gladstone, Duchess of Oldenburg, Duchess' Favourite, Dewdney's Seedling, Stirling Castle, Worcester Pearmain, Duke of Gloucester, Maltster, King of Pippins, Peasgood's Nonsuch, Hambledon deux Ans, Northern Greening, Bramley's Seedling, are bearing heavy crops. The fruit will be smaller than usual owing to the recent dry, hot weather.—W. H. DIVERS, *Belvoir Castle Gardens.*

Staffordshire.—Medium crop; orchard trees, fruit smaller than usual; trees in cultivated garden very fair. Soil, stiff loam, clay subsoil; cold. Varieties which grow and fruit well are: Dessert—Adams' Pearmain, Allen's Everlasting, American Mother, Blenheim Pippin, Claygate Pearmain, Court Pendu Plât, Cox's Orange, Devonshire Quarrenden, Duchess of Oldenburg, Dutch Mignonne, Early Harvest, Kerry Pippin, King of the Pippins, Lady Sudeley, Mannington's Pearmain, Margil, Ribston Pippin, Scarlet Pearmain, Sturmer Pippin, and Worcester Pearmain. Kitchen varieties—Alfriston, Beauty of Kent, Bismarck, Cellini, Cox's Pomona, Dumelow's Seedling, Ecklinville, Frogmore Prolific, Golden Noble, Grenadier, Hawthornden, Keswick Codlin, King of Tomkins County, Lane's Prince Albert, Lord Derby, Lord Grosvenor, Lord Suffield, Newton Wonder, Potts' Seedling, Reinette du Canada, Rymer, Small's Admirable, The Queen, Tom Putt, Sandringham, and Warner's King.—GEORGE WOODGATE, *Rolleston Hall Gardens.*

Sussex.—Apples here are only a partial crop. Of the hundred or more varieties grown there are only a few of them that are anything like up to the average, the best of which are the following: Lane's Prince Albert, a full crop of fine fruit; Ecklinville, good crop; King of Pippins, Warner's King, Worcester Pearmain, Blenheim Pippin, Seaton House, Lord Grosvenor, Jubilee, Bismarck, Newton Wonder, Cox's Orange Pippin, Peasgood's Nonsuch, Stirling Castle, Potts' Seedling, Keswick Codlin, Manks Codlin, Frogmore Prolific, and Irish Peach, Wealthy are among the best. Many varieties have failed to produce a fruit, while there are others that have not half a crop. Most of the fruit is of but poor quality owing to the lack of moisture in the soil, the rainfall here up to the middle of September amounting to only 11·18 inches. Many of the late varieties are falling off from premature ripening.—H. C. PRINSEP, *Buxted Park.*

Warwick.—Apples are a good crop in these gardens, in fact, are more abundant than for some years past. A few trees of such varieties as Frogmore Prolific, Stirling Castle, and Lord Derby have required thinning considerably. Other varieties bearing heavy crops are Ecklinville Seedling, Golden Noble, Potts' Seedling, Mère de Ménage, Northern Greening, Warner's King, Tower of Glamis, Lord Suffield, Codlins of sorts, Hambledon deux Ans, Emperor Alexander, Cox's Pomona, Winter Reinnette, Beauty of Kent, Court Pendu Plât, Cox's Orange, Kerry, and King of Pippins, Worcester Pearmain, and Yellow Ingestre. The crops of apples in old orchards in this neighbourhood are very partial, some trees carrying fair crops, and others have none.—T. H. MARTIN, *Stoneleigh Abbey.*

Wexford.—The crop of apples in the gardens here is poor, with the exception of Grenadier, Yorkshire Beauty, Cox's Orange Pippin, Keswick Codling, Ecklinville, and King of Tomkins County, which are bearing satisfactorily.—JOHN McLENNAN, *Castleborough.*

Wigtonshire.—Apples are a very fair crop, the fruit of good size, clean, and well coloured. Of dessets sorts, Thorle Pippin, Mr. Gladstone, Worcester Pearmain, Ravelstone Pippin, James Grieve, Cox's Orange, and Ribston Pippin are heavily cropped. Culinary sorts, as Manks Codlin, Keswick Codlin, Domino, Lane's Prince Albert, Stirling Castle, Warner's King, Cellini, Bramley's Seedling, Baillie Neilson, and Galloway Pippin are all very good; the last-named is one of our best and most reliable cropping apples, and this year the trees are loaded with fruit. It is good for culinary use in all stages, and late in the season is very useful for dessert.—JOHN DAY, *Galloway House Gardens.*

Yorkshire.—An average crop and quality good. The cold winds from which we suffer in the East Riding of Yorkshire, as a rule from March till June, frequently do much damage to fruit trees generally when the sap is rising, and this year cold east winds and frost were more in evidence than usual, the result is that the great promise of an abundant crop of all kinds of fruit has not been realised. Some kinds of apples are carrying heavy crops, while others are quite bare. The following varieties are carrying good crops:—Keswick Codlin, Potts' Seedling, New Hawthornden, Blenhiem Pippin, King of the Pippins, Warner's King, Cockpit (a very hardy and reliable apple, rather small), Bramley's Seedling, Bismarck, Ribston Pippin.—J. ALLSOP, *Dalton Hall.*

[illegible].—Lord Suffield, Keswick Codlin, Beauty of Kent, Hawthornden, Stirling Castle, Warner's King, Galloway Pippin, Rose Hill, Grey Leadington, Warwick Beauty, Yorkshire Greening, and Lewis's Incomparable have good average crops, the late hot weather following nice rains early in August have caused the fruits to swell nicely. We have had quite an epidemic of American blight this season. Syringing the trees after July came in with rain water in which two wine glasses of paraffin were mixed in each four gallon can checked the blight and did not injure the foliage. Were I planting early apple trees for profit I would prefer the old Keswick Codlin to its near relative, Lord Suffield, for this part. On dry limestone soils the latter does very well, but on sandy soils and cold clays it is very liable to canker. Our garden is situated on the limestone formation on the south west edge of the plain of York.—H. J. CLAYTON, *Grimston Park Gardens.*

IS BRITISH SPORT DYING OUT? has often been a question for discussion, and it is very satisfactory to know that a negative answer can be given. The physical condition of Englishmen has improved during the past half century, and the cause of this satisfactory change is attributed to the better style of living which has been adopted by all classes. Men are more temperate, both in eating and drinking, and, above all, the system is kept in tone and the blood purified by medicines of sterling worth, such as Holloway's Pills and Ointment. The taste for sport will never die while people use these remedies, which will cure or relieve any complaint, and give strength in place of weakness.—[ADVT.]

EXHIBITIONS AND MEETINGS.

ROYAL HORTICULTURAL SOCIETY, September 20.

ON the above date one of the largest displays of the year was gathered at the Drill Hall, and much difficulty was found in finding room for all the exhibits of fruit, flowers, and vegetables. Orchids, dahlias, and early chrysanthemums were the leading flowers, and they were extensively shown.

FLORAL COMMITTEE.

The great bulk of the exhibits had to come under the adjudication of this body, and its members were in a very liberal mood, as they gave awards to seventeen dahlias and six other subjects, besides distributing two first-class certificates and thirteen medals.

A splendid exhibit was put up by Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, and it consisted of gladiolus and dahlias; the gladiolus spikes were characterised by sturdiness, substantial flowers, breadth, and variety of colouring. Atlas, rose; Dora Craven, pale blush; Rayon d'Or, yellowish; Iona, scarlet; Meyerbeer, salmon; and Althea, pink and crimson, were half-a-dozen fine named sorts, but many of the seedlings were of equal merit; a few bunches of Nancianus forms added interest to the display; silver-gilt Flora medal. Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, staged a group of plants of the brilliant Salvia splendens grandiflora raised both from seed and from cuttings; silver Flora medal. Messrs. J. Veitch and Sons, Chelsea, contributed varieties of Hibiscus syriacus, Caryopteris mastacanthus, Abelia rupestris, some freely-flowered sprays of Bignonia venusta, and a big plant of Gynerium argenteum Rendatleri, with a number of elegant plumes. Mr. Hudson also showed a group of the now well-known Acalypha Sanderi, all the plants being remarkably well grown, and making a most effective display.

A handsome and comprehensive collection of early flowering chrysanthemums came from Mr. W. Wells, Earlswood, Redhill; Louis Lemaire, a bronzy sport from M. Grunerwald, was very showy, and other especially good sorts were Arthur Crepy, Market White, Mytchett White, Madame Liger Ligneaux, M. Max Dufosse, Jeanne Willermet, Mademoiselle Marie Masse, Flora, Harvest Home, Madame Zephir Lionett, and Ivy Stark, all useful for garden decoration; silver Banksian medal. A delightful lot of cut roses was shown by Messrs. W. Paul and Son, Waltham Cross, who exhibited the blooms in vases and baskets, and on boxes; Caroline Testout, Harrison Weir, Enchantress, Empress Alex. of Russia, Marie Van Houtte, Souvenir de Catherine Guillot, Mrs. W. J. Grant, Sappho, and Maman Cochet were well shown; a little more foliage would have improved the display; silver-gilt Banksian medal. A large collection of sweet peas came from Mr. Foster, Brockhampton Nurseries, Havant, but they showed the effect of dry weather and travel somewhat, and were not staged in a very good position to be seen to advantage; silver Banksian medal. Mr. W. H. Witty, Nunhead Cemetery, put up a large group of early flowering chrysanthemums, arranging them with adiantums; the ferns were arranged in three lines across the group, and the effect was bad; silver Banksian medal.

Mr. Seale, Sevenoaks, sent a few good pompon and single dahlias. Messrs. Paul and Son, Cheshunt, staged cut roses in baskets, but very little taste was displayed in the arrangement; François Dubreuil, Kaiserin Augusta Victoria, W. A. Richardson, and Paul's Cheshunt Scarlet were the most notable varieties on view. The same firm had large baskets of Cyclamen hederaceum album, and the typical form, autumn flowering colchicums in variety, and large showy bunches of gaillardias, perennial asters, sunflowers, and phloxes; among the latter P. Coquelicot and P. Etna are sorts finely suited for planting *en masse*; dahlias in variety and a batch of the pretty antipodean Veronica salicornoides, completed an extensive exhibit; silver-gilt Flora medal. Lady Freake, Fulwell Park, Twickenham, sent thirty-three spikes of cannas, comprising some twenty-one varieties, all of which had been cultivated in the open air; Sophie Buchner, Edouard Mieg, Papa, and Duchess of York, were especially bright and good; bronze Banksian medal. A group of ferns set up by Mr. H. B. May, Edmonton, consisted entirely of davallias, and was a most instructive collection, as it consisted of fifty species and varieties; the tiny D. parvula and D. alpina figured as well as the bold D. polyantha, the elegant D. Mooreana, and D. fijiensis; gilver-gilt Banksian medal. Mr. S. Mortimer, Farnham, made a good show of dahlias, both cactus and show varieties; the latter were represented by splendidly developed flowers of the leading forms; among the cactus dahlias the vivid scarlet E. J. Deal was conspicuous, and bears out all we have previously said about its excellence; silver Flora medal. An extensive display of single cactus, and pompon dahlias was made by Messrs. J. Cheal and Sons, Crawley, who made a very bright exhibit; among their cactus varieties we noted especially good examples of Arachne, Lady Edmund Talbot, Lady Pearson, a new rosy-red; Alfred Vasey, Mrs. Scrase Dickens, and Fantasy; the pompon forms were very neat and serviceable blooms; silver Flora medal. Some three dozen distinct varieties of cactus dahlias were set up by Mr. Charles Turner, Slough, and this exhibit is deserving of special mention, for the flowers were shown in vases of a variety instead of in the orthodox triangular sprays; the group was much more pleasing in this way than in the usual style; Night, Amber, Island Queen, Miss Webster, Alfred Vasey, and Lavestock Beauty, were well represented—this was a move in the right direction, and one we have so long advocated; silver Banksian medal. A display of dahlias representing all the section came from Mr. T. S. Ware, Tottenham; all the leading sorts were on view, and behind and among them were spikes of Lilium speciosum; a bright lot of canna spikes also came from the Hale Farm Nurseries; silver Banksian medal.

ORCHID COMMITTEE.

Messrs. Hugh Low and Co., Bush Hill Park, Enfield, had a neat group of orchids, in which Lælio-cattleya intermedia-flava, L.-c. Pallas, L.-c. Nysa splendens, Vanda cærulea, Cypripedium Charles Canham, C. Sanderianum, C. picturatum, C. Charlesworthi, and Cattleya velutina figured conspicuously; silver Banksian medal. Messrs. F. Sander and Co., St. Albans, sent flowering specimens of Dendrobium atro-violaceum, the rare Cypripedium purpuratum, Odontoglossum grande, &c., arranging them amid Pandanus Sanderi and Acalypha Sanderi. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking, showed the pretty and dwarf Oncidium longipes, O. trulliferum, a sort of glorified O. pubes, Miltonia spectabilis, and M. Binoti, the latter a supposed natural hybrid between M. candida and M. Regnelli purpurea. A deeply-coloured form of Cattleya Hardyana was shown by Mr. King, gardener to J. Colman, Esq., Gatton Park, Reigate.

Mr. F. Canham, gardener to C. H. Feiling, Esq., Southgate House, Southgate, put up a bright display, chiefly of Dendrobium Phalænopsis Schröderianum, all well grown and in good variety; a few good cypripedes and cattleyas made up the exhibit; silver Banksian medal. Messrs. J. Veitch and Sons, Chelsea, sent a good batch of orchids in flower, and in their interesting group we noted Rodriguezia venusta, well flowered, Cattleya velutina, Lælio-cattleya Nysa, Cypripedium Charles Canham, Cattleya Wendlandi, C. Chloris, the latter a bright hybrid between C. maxima and C. Bowringiana; Cypripedium Rothschildiano-villosum was most interesting, and other notable orchids were Lælia monophylla and Cœlogyne Veitchi; silver Flora medal. The old Epidendrum Brassavolæ and the curious Dendrobium Mirbelianum, with twisted green flowers, came from Messrs. J. Veitch and Sons. Mr. Bond, gardener to C. L. N. Ingram, Esq., Godalming, sent Lælio-cattleya T. W. Bond, a cross between C. labiata and L. purpurata. Messrs. J. W. Moore and Co., Royd Nurseries, Leeds, staged a large plant of a fine variety of Vanda cærulea.

FRUIT COMMITTEE.

A first-rate exhibit of fruit came from Messrs. William Paul and Son, Waltham Cross, who, in addition to a large collection of fine apples in dishes, sent handsomely-fruited pot trees of leading varieties of apples, pears, figs, and peaches; the apples were very well grown, and the whole group was a credit to the firm; silver-gilt Knightian medal. Messrs. J. Peed and Sons, Roupell Park Nurseries, Norwood, showed an excellent collection of apples and pears, both culinary and dessert varieties; the fruit was remarkably clean and fairly well coloured, solid, and of a good useful size. Grapes were also represented by good bunches of Syrian, Trebbiana, Barbarossa, Gros Colmar, Alicante, Golden Queen, Muscat of Alexandria, Mrs. Pince, Madresfield Court, Black Hamburgh, and Alnwick Seedling; a good display; silver Knightian medal. A big collection of apples and pears came from Messrs. J. Laing and Sons, who arranged some seventy-five dishes of fruit in as many varieties; Gravenstein, Barnack Beauty, Ribston Pippin, New Hawthornden, Lord Derby, Warner's King, King of the Pippins, Sandringham, Wellington, Emperor Alexander, Cox's Pomona, Frogmore Prolific, Alfriston, and Celina were notably good examples of first-rate apples in this collection of good fruit; silver Knightian medal.

Some dozen varieties of plums, all picked from pot trees in a cold orchard house, came from Mr. J. Hudson, Gunnersbury House Gardens; Monarch, Golden Transparent Gage, River's Orange, Coe's Golden Drop, Grand Duke, and Reine Claude du Bavay were represented by remarkably well developed fruits; a few fine melons were also shown by Mr. Hudson, who secured a silver Banksian medal. Mr. J. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, sent about thirty dishes of fruit, in which the Conkling, Prince of Wales, Golden Rathripe, and Barrington peaches, Pitmaston Duchess nectarines, and Brown Turkey figs were good samples; silver Banksian medal. Mr. T. Robinson, gardener to W. Laurence, Esq., Elsfield House, Hollingbourne, showed a really good collection of fruit and vegetables, winning a silver Banksian medal. He had Alicante, Buckland Sweetwater, and Gros Maroc grapes, Lord Palmerston and Sea Eagle peaches, Dr. Jules Guyot and Madame Treyve pears, Sutton's A 1 and Blenheim Orange melons, Peasgood Nonsuch apples, Kentish Invicta runner beans, Puritan and Snowdrop potatos, Exhibition tomatos, and Cranston's Excelsior onions. Mr. H. Guyett, gardener to Mrs. Gabriel, Leigham Court Road, Streatham, was awarded a silver Banksian medal for his exhibit—apples, pears, grapes, and crab apples.

Mr. Kelf, gardener to Mrs. Abbott, South Villa, Regent's Park, gained a silver-gilt Knightian medal for a first-rate display of fruit, a display the more creditable when we remember it was grown within two miles of Charing Cross. Muscat of Alexandria and Alicante grapes were finely coloured and finished. There was a good bunch of bananas—Musa Cavendishi, Blenheim Orange, Monarch, and Holborn Favourite melons, and Sutton's Dessert, Duke of York, Golden Jubilee, Perfection, and Peach Blow tomatos. Mr. W. J. Empson, gardener to Mrs. Wingfield, Ampthill, Beds, was awarded a silver Knightian medal for a grand lot of onions. The bulbs were solid, large, and weighty, and the varieties were Magnum Bonum, Golden Globe Tripoli, Cranston's Excelsior, Bedfordshire Champion, Record—the eighteen bulbs weighing 44½ pounds; Ailsa Craig, Holborn, Brown Globe, Lord Keeper, Empson's Selected, Cocoanut, and Rousham Park Hero.

Mr. R. J. Hamill, gardener to F. S. Roberts, Esq., Beauvoir, St. Saviour's, Jersey, gained a silver Banksian medal for a good collection of apples and pears; the apples were of large size, solid and brightly coloured, as might be expected from the Channel Islands. Mr. W. Collins, Chios House, Clapham Park, sent a few apples and pears of such excellence as to merit a vote of thanks. Mr. A. Bull, Cotterham, sent some magnificent examples of Pond's seedling plums; while Messrs. J. Veitch and Sons showed a dish of Late Devonian peaches. Mr. J. Green, Dereham, showed Up-to-date tomato. Messrs. H. Cannell and Sons, sent St. Joseph strawberries, a perpetual fruiting variety. This was also sent by Mr. Hudson and Messrs. Bunyard and Co., Maidstone. Mr. W. Roupell, Harvey Lodge, Roupell Park, sent a group of pot figs, showing also persimmons and Anona Cherimolia, grown out of doors. The same exhibitor was also awarded a silver Knightian medal for a goodly collection of apples, tomatos, and grapes; Muscat of Alexandria, Gros Colmar, Centennial, and Diamont Traube, were well-finished and most interesting. Mr. S. T. Wright, Superintendent, R.H.S. Gardens, Chiswick, made a most interesting and educational exhibit of a hundred varieties of apples grown in the Society's gardens. It would appear that the crop of apples at Chiswick is a good one on the whole, and that not many varieties have missed a crop.

WELLINGBOROUGH MIDLAND COUNTIES DAHLIA SOCIETY

THE third annual exhibition of this society took place on the 9th and 10th inst., the spacious Corn Exchange being well filled with dahlias of great excellence. The number of exhibitors and entries had materially increased, and the remarkable advance in the general good quality of the flowers was a remarkable feature. The big, coarse, open-eyed dahlias seen at the first show in 1896 have entirely disappeared, and, on the part of the working men especially, all the types of the dahlia were remarkable improvements on what was seen a year ago. Several of the southern growers exhibited in the classes open to all England, and their presence and blooms materially increased the interest in the exhibition. Mr. Thomas Pendered, an influential resident in the district, is the president of the society, and, helped by a good committee and an energetic secretary, the society appears to be established on a sound basis.

The best twenty-four show and fancy dahlias came from Mr. John Walker, Thame, Oxon, who had in very fine form John Hickling, Perfection, Buffalo Bill (self), Mrs. J. Downie, Harry Turner, John Walker, Mrs. Every, Duke of Fife, William Powell, James Cocker, &c. Mr. S. Mortimer, Swiss Nursery, Farnham, came second; and Messrs. Keynes, Williams, and Co. Salisbury, third. An extra prize was awarded to Mr. George Humphries, Chippenham. There were seven entries. There were nine entries of twelve blooms. Mr. J. Walker was again first, showing, in fine character, Daniel Cornish, Goldfinder, Duchess of Albany, Wm. Keith, John Hickling, Goldsmith, &c.; Mr. Mortimer was again a good second; and Messrs. C. Kimberley and Son, Stoke, near Coventry, third.

In the class for twenty-four blooms of cactus dahlias shown on a board as in the case of the show varieties, Messrs. Keynes, Williams, and Co. were first with a very fine collection indeed, beautifully fresh and even, which comprised Britannia, Stella, Exquisite, Daffodil, Mrs. John Goddard, Harmony, Ethel, Progenitor, Wallace, Laverstock Beauty, The Clown, Starfish, Countess of Lonsdale, &c. Messrs. J. Burrell and Co., Howe End Nurseries, Cambridge, second, with a very fine and fresh collection, also a little smaller in sizes, chief among them Lucius, Island Queen, Britannia, Keynes' White, Debonair, Ajax, Mimosa, &c., mainly highly promising new varieties of their own raising. Mr. Mortimer was third. Messrs. Keynes and Co. were also first with twelve varieties, staging very fine blooms of those already named; Mr. G. Humphries came in second; and Mr. Mortimer, third.

Cactus dahlias in twelve bunches of three distinct made a fine and attractive feature. Messrs. Keynes and Co. again took the lead, having in very fine character Britannia, Radiance, Wallace, Progenitor, Countess of Sherbrooke, Countess of Lonsdale, The Clown, Starfish, &c.; Messrs. J. Burrell and Co. were a close second, showing also in fine character Antelope, Lucius, Mary Service, Starfish, Britannia, &c.; Mr. Mortimer, third. Messrs. J. Burrell and Co. were first with twelve bunches of pompon varieties, six blooms in a bunch, staging model flowers, small, even in size, and very fresh, the varieties Arthur West, George Brinckman, E. F. Jungker, Bacchus, Tommy Keith, Rosebud, Douglas, Phœbus, &c.; Messrs. Keynes and Co., second, also with excellent bunches, having Tommy Keith, Spitfire, Clarissa, Hypatia, Emily Hopper, &c. in fine character; Mr. J. Walker was third.

In the amateurs' division the best twelve blooms of show dahlias came from Mr. F. Middleton, Althorpe, and Mr. R. Burgin, St. Neot's, was second, both showing very good flowers. Mr. Burgin was first with six capital flowers, and Mr. Middleton second; but Mr. Middleton gained the first prize with twelve blooms of cactus, having in excellent form Britannia, Island Queen, Earl of Pembroke, Standard Bearer, Starfish, Arachne, and Night; Mr. H. A. Needs, Horsell, Woking, was second; and Mr. R. Burgin, third. With six cut blooms Mr. Middleton was again first; and Mr. W. E. Prentice, jun., Wellingborough, second. Mr. Needs was first with six excellent bunches of cactus dahlias, three in a bunch, having Harmony, Starfish, Charles Woodbridge, Keynes' White, &c.; Mr. Burgin was second; and Mr. Middleton, third. Some very creditable bunches of pompons were also shown, but we missed the awards by accident. There were also bouquets of dahlias, Mr. Burgin taking the first prize.

There were classes of dahlias also for cottagers, in which some very good flowers were staged, and the cottagers have been by no means slow to gather up the ideas of quality, as shown by the preferences of the judges. The first of the special prizes offered by Mr. R. Dean, one of the judges, for three bunches of cactus dahlias, six in a bunch, was won by Mr. W. E. Prentice, jun.; Mr. W. Spriggs, the secretary of the society, was second; and Mr. W. Mason, third. The first of the special prizes offered by Mr. George Humphries for six blooms of show and fancy dahlias was won by Mr. E. Matthews, Wellingborough; Mr. Gennis was second; and Mr. C. Cox, third. The silver-gilt medal offered by Messrs. Dobbie and Co., of Rothesay, for the most successful exhibitor was won by Mr. W. E. Prentice, jun., Wellingborough.

A jury of the principal exhibitors and the judges awarded the following certificates of merit: To show dahlia, David Johnson, and cactus dahlia, Ranji, from Mr. George Humphries; to cactus dahlia, Magnificent, from Mr. J. Stredwick, Silverhill, St. Leonard's-on-Sea; to cactus dahlias, Wallace, Progenitor, The Clown, Viscountess Sherbrooke, Radiance, and Countess of Lonsdale, from Messrs. Keynes, Williams, and Co.; and to cactus, Lucius and Antelope, and pompon, The Duke, from Messrs. J. Burrell and Co.

There were a few open classes for fruit, chief among them, three dishes of culinary apples, Mr. T. Pendered, the president of the society, being first with very good fruits of Ecklinville, Peasgood's Nonsuch, and Warner's King; Mr. J. E. Bugby, Desborough, was second, with Ecklinville, Peasgood's Nonsuch, and Perkins A1. Mr. Pendered also had the three best dishes of dessert apples, having in good character Cox's Orange Pippin, Worcester Pearmain, and King of Pippins; Mr. G. Douglas, Wellingborough, was second, with Quarrenden, Cox's Orange Pippin, and Worcester Pearmain. Mr. Pendered followed up his successes by taking the first prizes with three dishes of dessert pears, having Pitmaston Duchess, Louis Bonne of Jersey, and Marie Louise; Messrs. T. Clayton and Son, Wellingborough, were second, with Madame Treyve, Pitmaston Duchess, and Souvenir du Congres. The latter had the best two bunches of grapes, staging fully ripe and finely flavoured Muscat Hamburgh of good colour; Mr. H. Rathman was second, with a bunch each of Black Hamburgh and Alicante.

WOODSTOCK FLOWER SHOW, SEPTEMBER 13.

ALTHOUGH the latest of the Oxon shows, the forty-first of the above, held in Blenheim Park, proved to be a record one in point of attendance, the natural beauties of the site and surroundings, and the large exhibition of horses, poultry, and other live stock, jumping and driving, tending to attract visitors; in addition, some 1,300 specimen agricultural roots were entered in competition. Horticultural entries were fewer, traceable to the incidence of the season, but more to the fact that the money prizes are much too small to attract exhibitors from a distance, to which may be added the ambiguity of terms employed in the schedule, which are somewhat perplexing. As a result of the meagreness of entries the executive appeal to and receive much aid from the several large gardens round, and thus are enabled to present a very attractive display.

In the competition the groups of plants for effect, on forty feet superficial, were generally semi-circular pyramids, Mr. W. T. Mattock, Blenheim Nursery, Barton-cum-Headington, being first, his arrangement having some bright, showy coleus for a central band; Mr. Johnson, Garsington Nurseries, second, he being the premier in the classes for six greenhouse ferns, one specimen greenhouse, three fuchsias, and three zonal geraniums, all of good quality. (It was somewhat remarkable that Woodstock did not present one specimen in the competition.) Mr. W. F. Cross, Chilswell, Oxford, had the premier group of hardy ferns.

The cut flower classes were well filled, and a grand display of colour was produced by the nearly one hundred bouquets, the bulk possessing artistic merit. There were some fairly good dahlias, both show and fancy—Mr. Johnson first for twenty-four and twelve, putting up cactus; Mr. Kirtland premier for a dozen show varieties in the amateur class—but exhibitors appear to care little about giving the varietal names, forgetting that this is one essential towards making the exhibition attractive. Asters, from Kirtlington—Mr. G. Kirtland securing four firsts in the two divisions with some of the finest developments exhibited in the district this season—both quilled and incurved, were good, but why the framers of the schedule should still denominate the forms as "German" and "French" is a problem which needs to be explained (the terms "quilled," "incurved," and "reflexed" would cover the whole ground and make matters simpler). Again, the grouping of "single and fancy" dahlias in one class is altogether a misapprehension; "single or pompon" would be a nearer match. The gladioli from Mr. W. T. Mattock were fairly good spikes; and the first prize double zinnias, Mr. Johnson, were superior to anything exhibited in the county this season.

Zonal geraniums, six trusses in a bunch, were a good exhibit from Messrs. Perry, of Banbury, but the varieties should have been labelled to have afforded comparison. Messrs. Perry, Banbury, were the only competitors in the class for a floral device, submitting an Irish harp, the framework of very choice blossoms, the strings being formed with the small spherical heads of Achillea millefolia set in Asparagus plumosus sprays.

Fruit classes were well filled, the premier award for the society's collection (number of dishes unlimited) going to Mr. Swaine, gardener to W. M. Foster-Melliar, Esq., North Aston Hall, who staged Blenheim Orange melon, Golden Drop plums, Muscat of Alexandria and Black Hamburgh grapes, Brunswick figs, Nectarine peaches, Bon Chretien pears, Duchess of Oldenburg apples, red and white currants, filberts, &c.; Mr. Turner, gardener to the Rev. W. F. Cartwright, Aynho Rectory, second. Mr. Swaine had the premier award for peaches, with a grand half-dozen specimens of Nectarine—as good an exhibit as has been staged in the county this season; Mr. Turner, second. Melons were in fair numbers, the prize falling to a richly-flavoured scarlet-fleshed variety named Kiddington Hybrid, raised by Mr. E. Farmer, gardener to C. Thurburn, Esq., Kiddington Hall. For four bunches of grapes, the award went to dual clusters of Hamburgh and Alicante, exhibited by the Rev. T. Nolan, Kirtlington Rectory; Mr. W. Hovell, gardener to G. H. Morrell, Esq., M.P., Headington Hill Hall, second, with Black Hamburgh and Trebbiano; Mr. C. Brock, gardener to Dr. Batt, Witney, third. Transparent Gage, from Ditchley Park Gardens, proved the best flavoured plums; those by weight being Pond's Seedling, from Mr. W. Hovell, first; Magnum Bonum taking the second and third awards. The finest pears were Bon Chretien, from Mr. R. Hope, gardener to Captain Orr-Ewing, Bletchington Park, who also produced the grandest dish of Peasgood's Nonsuch apples yet seen in the district. Vegetables were a good all-round section, Mr. R. Wadham, gardener to Admiral Bradshaw, The Grange, Steeple Aston, securing the premier awards in both Messrs. Sutton and Sons' and Messrs. Webb and Sons' classes.

BICESTER HORTICULTURAL SOCIETY.

In conjunction with the Agricultural Association, this society held its usual exhibition in the grounds of Bicester House. Entries all round were fewer, but the extra productions helped the display. Among these was a large collection of foliage and flowering plants sent by Charles T. Hoare, Esq., Bignell House, which filled the end of the largest tent, the design being formed by a back-ground of Kentia and other palms, ferns, &c., relieved by masses of Hydrangea paniculata, bouvardias in variety, Madame Desgrange chrysanthemum and its sports, dracænas, alocasias, eucalyptus, crotons, begonias, coleus, Pandanus Veitchi, forming a foreground of dot plants, surrounded with small ferns mixed with achimenes, &c.; a smaller group occupying the end of the central table near the entrance. This was arranged by Mr. Trollope, gardener to Earl Jersey, Middleton Park, and comprised of many of the above-named subjects, having in addition very pretty pieces of Asparagus plumosus, cannas, tuberoses, celosias, Caladium argyrites, cyperus, and ferns, edged with ferns and Primula obconica. As a contrast to the plants, Mr. John Walker, Thame, staged a fine collection of dahlias, including two dozen specimen blooms of show and fancy ferns, eighteen varieties of cactus, and a dozen each of single and pompon, the last three classes being posed in bunches of six blooms each. Mr. P. J. Perry, The Nurseries, Banbury, contributed a large collection of herbaceous perennials in neat bouquets, some new summer-flowering chrysanthemums, a shower bouquet of very choice blossoms, and an Irish harp, the framework of Lilium speciosum, white chrysanthemums, marguerites, sweet pea, tuberoses, carnations, the strings of pips of the blue corn flower; a much larger collection being staged by Mr. H. Deverill, Banbury, consisting of three dozen varieties of show and fancy dahlias, one dozen varieties each of cactus, single, and pompon dahlias, six blooms each, three dozen spikes of gladioli, and a varied assortment of perennials, in large bunches deftly posed.

In the competition, the most tastefully disposed arrangement came from Chesterton Gardens, the back line of palms, the foreground of mounds set with neat specimen plants such as celosias, African lily, fuchsias, begonias, and caladiums, the central specimen being a fine piece of Croton angustifolium; the second card going to a more formal arrangement; Mr. J. Timms, gardener to H. Tubb, Esq., Chesterton House, being the largest contributor of plants, he taking the card for one specimen with a fine Kentia, and also premier for six varieties, putting up very healthy examples of Dracæna australis, Croton Warreni, Caladium Triomphe de la Exposition, Cassia corymbosa, Plumbago capensis, and Eucharis amazonica; his premier six ferns being equally meritorious, and comprised Woodwardia radicans, and Adiantums farleyense, A. gracillimum, A. formosum, A. decorum, and A. cuneatum; in this class, Mrs. E. Palmer, Rose Cottage, was a fair second, having two davallias, an asplenium, and three adiantums, a gracillimum being a charming specimen. An open class for twelve plants in flower (amateurs) was a massing of colour produced by begonias, fuchsias, geraniums, and gloxinias. The first prize was awarded to Mrs. E. Palmer; Mr. T. Anstiss, Brill, second.

Cut flowers were of very fair quality, including a number of stands of dahlias, Mr. Anstiss, first, for eighteen show and and fancy; Mr. G. Kirtland, Bletchington, first, for twelve; Dr. P. L. Benson, Steeple Claydon, leading with some good forms of cactus, but in each case the varieties were not named. The asters (quilled, incurved, and reflexed) exhibited by Mr. A. E. Kirtland, gardener to Rev. R. F. Dale, Bletchington Rectory, were large, full-centred, and bright; Mr. G. Kirtland taking the cards in the amateur section. The collections of cut blooms were likewise a good feature, Mr. Timms being placed first with nicely posed bunches of cactus dahlias, eucharis, agapanthus, Allamanda Schotti, Statice latifolia, roses, chrysanthemums, asters, dianthus, scabious, sweet peas, carnations, salpiglossis, Lapageria alba, and Stephanotis floribunda; Mr. Steers, gardener to E. Slater-Harrison, Esq., Shelswell Park, second, for bouquets of one variety only, these consisting of Drummond's phlox, coreopsis, petunias, salvias, anemones, gaillardias, scabious, single dianthus, Comet aster, verbena, zinnia, carnation, corn flower, begonia, hydrangea, Madame Crousse, ivy-leaved pelargonium.

Fruit was not equal to the display that might be expected in a district possessing a number of good gardens. Grapes were not strongly represented, the first prize for white going to Mr. Ashmore, gardener to C. Keith Falconer, Esq., The Garth, for Golden Hamburgh; Mr. Timms second, with Foster's Seedling; Mr. Harrison, gardener to Sir Algernon Peyton, Bart., Swift's House, leading in the black class with finely-finished clusters of Alicante; Mr. Timms second, with Black Hamburgh. Peaches and nectarines in the first division were very poor; pears were few and poor; dessert apples limited to Quarrenden; plums were fair samples of Jefferson and Washington, the amateurs being stronger in the classes for apricots, apples, plums, and pears. For a collection Mr. H. Watts, Launton, had Jargonelle pears, Black Hamburgh grapes, Red Warrington gooseberries, Victoria plums, Morello cherries, melon, and red currants, which well deserved the premier (amateur's) card; Mr. T. C. Finch second, for Fairleigh damsons, Jargonelle pears (wonderfully large), grapes, Quarrenden apples, peaches, and Kirke's plums. One exhibit only of peaches and Moorpark aprico adorned the amateurs' table, but they were of good quality; the culinary plums, by weight, was a good class, Dr. P. L. Benson first, with Cox's Emperor (weight 1 lb. 14 oz. the eight fruits; Mr. H. G. King, Buckingham, second, with Magnum Bonums (1 lb. 11 oz.); Mr. W. H. Piggott, St. Edburg's Cottage, third, with Pond's Seedling (1 lb. 10 oz.) Amateurs' grapes were Buckland Sweetwater and Foster's Seedling, the prizes for black going to Hamburghs. Culinary apples (by weight) were fine specimens of Warner's King and Blenheim Pippin, Irish Peach scoring highest in the dessert class. The best flavoured melon was a well-formed Early Davenham, Webb's Bountiful cucumber securing the card; tomatos were good, and appeared of the Perfection type.

Vegetables in the three divisions were a full average, the most striking quality being manifested in the classes for white round potatos, the dishes of Satisfaction being exceedingly handsome though bulky, the cottagers being in no way to the rear.

ONION COMPETITION AT NORWICH.

A few days since Messrs. Daniels Bros. held a competition of their Golden Rocca onion, when no less than seven hundred and sixty-one lots of three bulbs each were entered. The judges expressed surprise at the large number, and admiration of the extraordinary size and quality of the bulbs. £25 was offered as prizes, the following being the winners: Mr. J. Bowerman, Hackwood Park, Basingstoke, first (weight 7 lb.); Mr. J. W. Harrison, Wardour, Tisbury, second; Mr. H. Folkes, Gaddesden, Hemel Hempstead, third; Mr. R. Lye, Sydmonton Court, Newbury, fourth; Mr. J. Chiverton, St. Radagunds, Isle of Wight, fifth; Mr. C. Prater, Sydmonton, Newbury, sixth; Mr. W. Balsdon, Crediton, seventh; and Mr. George Neal, The Gardens, Bampton, eighth; some other exhibitors received a highly commended card.

NEW INVENTION.

Frosteen Shading.—A liquid for use upon glass where a more or less permanent shade is necessary for the occupants of the house has recently been introduced under the name of Frosteen Shading. It should be used on a damp day, so that it may not dry too quickly, and should be applied with a soft brush, brushing the glass lengthways and then crosswise. When properly applied, and dry, this shading has the appearance of frost on the glass, and while it excludes great heat, it does not materially obstruct the light. Where a permanent shade is desired, Frosteen Shading may be supplemented by Frosteen Azo, another liquid to be brushed over the shading when the latter is dry and hard. The Frosteen Syndicate (Limited), 341, Argyle Street, Glasgow, supply both liquids.

A New Sunshine Recorder.—Professor Callendar exhibited a quantitative sunshine recorder at the meeting of the British Association at Bristol. In describing the invention, he said the instrument is essentially a recording bolometer, in which the difference of temperature between a blackened and a bright platinum thermometer of equal resistance is recorded in pen and ink in the form of a continuous curve on a revolving drum. It differs from ordinary sunshine recorders in giving a strictly quantitative record of the quantity of heat received by the earth's surface, and not merely the number of hours of bright sunshine. The instrument records the component of the sunshine in any desired direction, and gives a very complete record of its character and intensity. The passage of small clouds across the sun is very clearly recorded, and it is found that even when the sun is obscured by clouds of sufficient thickness to prevent any trace of burning on the ordinary cards a very considerable percentage of the sun's heat may still penetrate. The recording apparatus used is identical with that required for records of temperature, pressure, voltage, &c., and may be located in any convenient situation, at any required distance from the bolometer. A simple form of planimeter is attached to the instrument when used for recording sunshine. The reading of the planimeter gives directly at any time the total quantity of heat received, and can be readily reduced to the number of equivalent hours of "bright sunshine" by means of a suitable factor.

MARKETS.

Covent Garden.

THE supplies of fruit and vegetables on offer are good, and the demand is fairly brisk. English apples are arriving in larger quantities and better quality than was expected a short time since. The cut flower trade is moderate, and prices low. Potato trade still somewhat dull.

FRUIT.—English apples, 3s. to 8s. 6d. per bushel; English grapes, 10d. to 2s.; Jersey, 6d. to 1s. per lb.; Denia, 4s. 6d. to 7s. 6d. per barrel; English pears, 3s. 6d. to 9s. per bushel; French, 2s. 6d. to 6s. per case; Orleans plums, 2s. to 4s.; Victoria, 2s. to 4s. 6d; damsons, 2s. to [illegible] per half sieve; [illegible] each; bananas, 5s. to 10s. per bunch; peaches, 2s. to [illegible]; green figs, 9d. to 1s. 6d. per dozen; English melons, 9d. to 1s. 6d. each; Spanish, 4s. 6d. to [illegible] per case; English tomatos, 3d. to 4d.; Jersey, 2d. to 3d. per lb.; [illegible] to 4s. per 12 lb.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to [illegible]; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 2s to 3s.; gardenias, 1s. to 2s. [illegible] Lilium Harrisii, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 1s. to 1s. 6d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; asters, 2s. to 4s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; pelargoniums (scarlet), 3s. to 5s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 9d. to 1s. 6d.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Celery, 12s. to 18s.; horseradish, 10s. to 15s. per dozen rolls; scarlet beans, 3s. to 4s. per bushel; cabbages, 3s. 6d. to 5s. 6d; beetroots, 2s. to 3s.; vegetable marrows, 3s. 6d. to 5s. 6d. per tally; Valencia onions, 4s. 6d. to 6s.; Ports, 5s. to 6s. per case; mint, 2s. to 2s. 6d.; parsley, 2s. to 2s. 6d.; leeks, 1s. 6d. to 2s.; carrots, 2s. 6d. to 3s. 6d.; turnips, 3s. to 4s.; per dozen bunches; endive, 1s. to 1s. 4d.; cauliflowers, 1s. 6d. to 2s. 6d.; cucumbers, 1s. 9d. to 4s. per dozen; lettuce, 9d. to 1s. 3d. per score; garlic, 3s. to 4s.; eschallots, 1s. 3d. to 1s. 9d.; mushrooms, 6s. to 9s. per 12 lb.; potatos, 55s. to 90s. per ton.

Borough Potato Market.

Supplies are continuously heavy now that harvesting has been completed in most of the English counties. The demand is fair, but prices continue low. Beauty of Hebron and Snowdrops, 3s. 6d. to 4s.; White Hebrons, Early Puritan, Sutton's Early Regents, Reading Giants, and Imperators, 3s. to 3s. 6d.; Black Lands, 2s. 6d. to 2s. 9d. per cwt.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Liquid Manure.—R. Martin, Barton-on-Orwell: A liquid manure suitable for the purpose you mention would be guano-water, prepared by adding guano to water, at the rate of two ounces to three gallons. The drainings from the stable or farmyard, diluted with water according to its strength, is also excellent.

Carpet Bedding.—Hortus, Braemar: You would save expense by writing direct to Mr. Ludwig Möller, Erfurt, Germany, with respect to the work referred to—"Album für Teppichgärtneri und Gruppenbepflanzung," by Karl Götze. You might mention where you saw the reference, and you will then have no difficulty in obtaining the information you desire.

Pitcher Plants for Exhibition.—T. D.: A nepenthes would be admissible in a class for foliage plants. and is generally recognised as a foliage plant. The pitchers are but coloured continuations of the leaf blade, peculiarly formed so as to enable the plant to capture insects and thus obtain nitrogenous food; they are not flowers in any sense, the inflorescence being an elongated raceme of tiny greenish flowers, rather more conspicuous than that of a croton and less so than in many of the dracænas. You need not fear disqualification.

Lifting the Potato Crop.—A. M. R.: As we have so frequently pointed out, potatos may be lifted and stored as soon as the skins are sufficiently firm to allow of the tubers to be handled without rubbing them off. Therefore, there will not be any occasion for you to expose your crop to an attack of disease should the weather conditions undergo a change favourable to the development of the disease producing fungus. We should not, however, advise you to lift the main-crop varieties still in full growth, unless they show signs of supertuberation or there is a change in the weather.

Melon Roots.—The subscriber who has sent us some diseased roots of melons packed in a tin box is informed that the plants are suffering from a severe attack of eelworms, and that nothing can be done to restore the plants to a healthy state. The plants should be pulled up and burnt, and the soil removed from the bed and burnt in the same way as clay is burnt for conversion into ballast. The walls and sides of the bed should be thoroughly cleansed with a strong solution of carbolic acid and then washed over with hot lime. The nematodes may have been introduced in the soil, the manure, or the water, it is practically impossible to say which. In consequence of the large amount of moisture contained in the box, the letter was converted into pulp in the course of transmission through the post.

Unsatisfactory Chrysanthemums.—R. F., Yorkshire: You have not supplied us with sufficient information to enable us to advise you with regard to the condition of the chrysanthemums under your care. You have told us sufficient to suggest that the plants have been raised from cuttings taken from plants that were highly fed with a view to obtain large blooms for exhibition. If this be the case you will not be able to do anything to materially improve their condition; and, so far as we are able to gather from your letter, there is not much likelihood of you achieving much success as an exhibitor. The plants will probably give you a supply of flowers that will prove useful in the conservatory and for decorative purposes in a cut state, and should, therefore, receive careful attention. We would strongly advise you to obtain cuttings from plants that have been grown under natural conditions when you propagate the stock for flowering next year. In all gardens in which chrysanthemums are grown for exhibitions, duplicates should be grown in the open quarters, and late in the autumn be lifted and put in frames for furnishing supplies of cuttings.

Agapanthus not Flowering.—G. F. B, Ellesmere. To ensure an abundant production of flowers, Agapanthus umbellatus and its varieties require to be kept dry at the roots during the late autumn and winter months, and as your specimen is associated with other plants in the border, it has had too much moisture at the roots during the season. We are inclined to the opinion, after a careful perusal of your letter, that the soil in the border has became sour, and would advise you to lift the plant, and after the removal of the old soil put it into a pot just large enough to accommodate the roots, and from November till the end of January keep the soil decidedly dry. Turfy loam with moderate additions of coarse sand, leaf-mould, and well-rotted manure. A sunny position is essential from early in the spring until the autumn, and there is no better position than a cool, airy greenhouse; but from June until September the plant may occupy a sunny position out of doors. It might be well to plant the passion-flower in the border, but it will not flower satisfactorily in a shaded position.

Watering Fruit Trees.—W K., Herts: You have been wrongly advised with regard to the supply of water to fruit trees from which the crop has been gathered. Some of the members of the old school of gardening held the opinion that to ensure the trees having a perfect rest it was necessary they should be kept quite dry, and in giving practical effect to this opinion they frequently failed to obtain a good crop in the following season. Dryness at the root has a tendency to check growth, but the check thus given is more or less injurious, and the trees resent the injury they receive by shedding their buds prematurely or not opening them in such a way as to ensure what is technically known as "a good set." If you remember for a moment that the embryo flowers are formed within the buds previous to the shedding of the leaves in the autumn, you will appreciate the importance of giving the trees such assistance as will enable them to complete their year's work. Moisture is necessary to replace the loss from evaporation, and also for the purpose of conveying food material to the different parts of the tree, and without a sufficiency of water there cannot be a satisfactory completion of the growth. It is not necessary the borders should be so moist after the fruit has been gathered as when the trees were in full growth and swelling up a heavy crop; but moisture in the soil is absolutely necessary, and one of the most successful grape growers with whom we are acquainted gives his vines a liberal supply of liquid manure after the grapes have been cut, and the splendidly finished clusters that are annually produced prove to demonstration that the practice is a good one. It is not usually necessary to supply water to peach and nectarine trees trained to open walls, but this season a thorough soaking of the border with diluted sewage or plain water would be beneficial.

Forcing Strawberries.—H. J., Cork. Presuming the runners have been shifted into the pots in which they are to be fruited, they will not require for some time to have any further attention than to be supplied with sufficient water at the roots. They should, until November, be stood upon a bed of coal ashes made up in an open position, and early in the month mentioned it will be advisable to plunge the pots rather close together in a bed of coal ashes of sufficient thickness to allow three inches of ashes under the pots to prevent worms from entering them. The time for taking them under glass will depend upon the date on which ripe fruit is required, but when strawberries have to be forced in a vinery without the fruit being required at any particular time, the best course is to take them into the vinery when the vines are started, that they may not be subjected to a high temperature at first. If the vinery does not contain any other plants and is kept freely ventilated until shut for the purpose of starting the vines, the strawberries may be taken under glass in November, care being taken to supply them with moderate supplies of water.

Fungus on Chrysanthemums.—C.J.D., Tunbridge Wells; R.W., Maidstone: In both cases the chrysanthemums are suffering from a very bad attack of a rust coloured fungus that is unfortunately spreading rapidly in this country. The best thing to be done is to remove the worst afflicted leaves and burn them in a furnace and sponge the rest with a solution of sulphide of potassium; syringing or spraying with this or Bordeaux mixture would check the disease but sponging will be by far the most effectual, though the operation will take longer, as it prevents the distribution of spores which syringing might occasion. After the sponging, and as soon as the foliage has become dry again, spray the plant with a similar, but clean solution—half an ounce of sulphide of potassium (liver of sulphur) to one gallon of water. Every two or three days it will be advisable to again spray the plants so that the fungus may be completely destroyed ere housing becomes compulsory. The man in charge should also have a sponge and some solution always at hand to remove any rust that may appear. Only by the most persistent efforts can the pest be kept down, consequently the surroundings of the plants should be treated with the solution, and it would be well to remove a film of surface soil from the pots after the sponging.

Names of Plants.—J. S., St. Albans: 1, Rhus cotinus; 2, Anthericum variegatum; 3, Datura Stramonium—The Thorn apple.

W. G., Sydenham: Abelia rupestris. We cannot tell the value of the plant without seeing it; it would not be great.

N. L. A., Richmond: 1, Davallia parvula; 2, Selaginella Wildenovi; 3, Hibiscus Cooperi; 4, Fittonia argyroneura.

C. B., Wolverton: 1, Hibiscus syriacus totus albus; 2, Rudbeckia speciosa; 3, Aster Amellus; 4, Montbretia crocosmiæflora; 5, Hieraceum aurantiacum.

Names of Fruit.—W. H., Hughenden: The Japanese Wineberry, Rubus phœnicolasius.

M. M., Worcester: 1, Ecklinville Seedling; 2, Warner's King; 3, King of Tomkins County; 4, Gravenstein; 5, Court of Wick.

Y. G. S., Warkworth: 1, Loddington; 2, Lord Derby; 3, Ribston Pippin, a poor specimen; 4, Mère de Ménage.

R. F. J., Tamworth: 1, Lane's Prince Albert; 2, Dumelow's Seedling; 3, Keswick Codlin.

The mean reading of the Barometer during the week at Greenwich was 29·95 inches, and that of the Thermometer 66°·4, the latter being 8°·6 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 26 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 56·8 hours. The measured rainfall amounted to 0·02 of an inch.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, SEPTEMBER 26.—General Committee Meeting of the National Chrysanthemum Society.

THURSDAY, SEPTEMBER 29.—Royal Horticultural Society's Great Exhibition of British Grown Fruit at the Crystal Palace; Three days.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY, SEPTEMBER 26, 27, 28, 29, AND 30.—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

FRIDAY, SEPTEMBER 30.—Imported and Established Orchids, Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

MONDAY AND WEDNESDAY, SEPTEMBER 26 AND 28.—Dutch Bulbs, Mr. J. C. Stevens, King Street, Covent Garden.

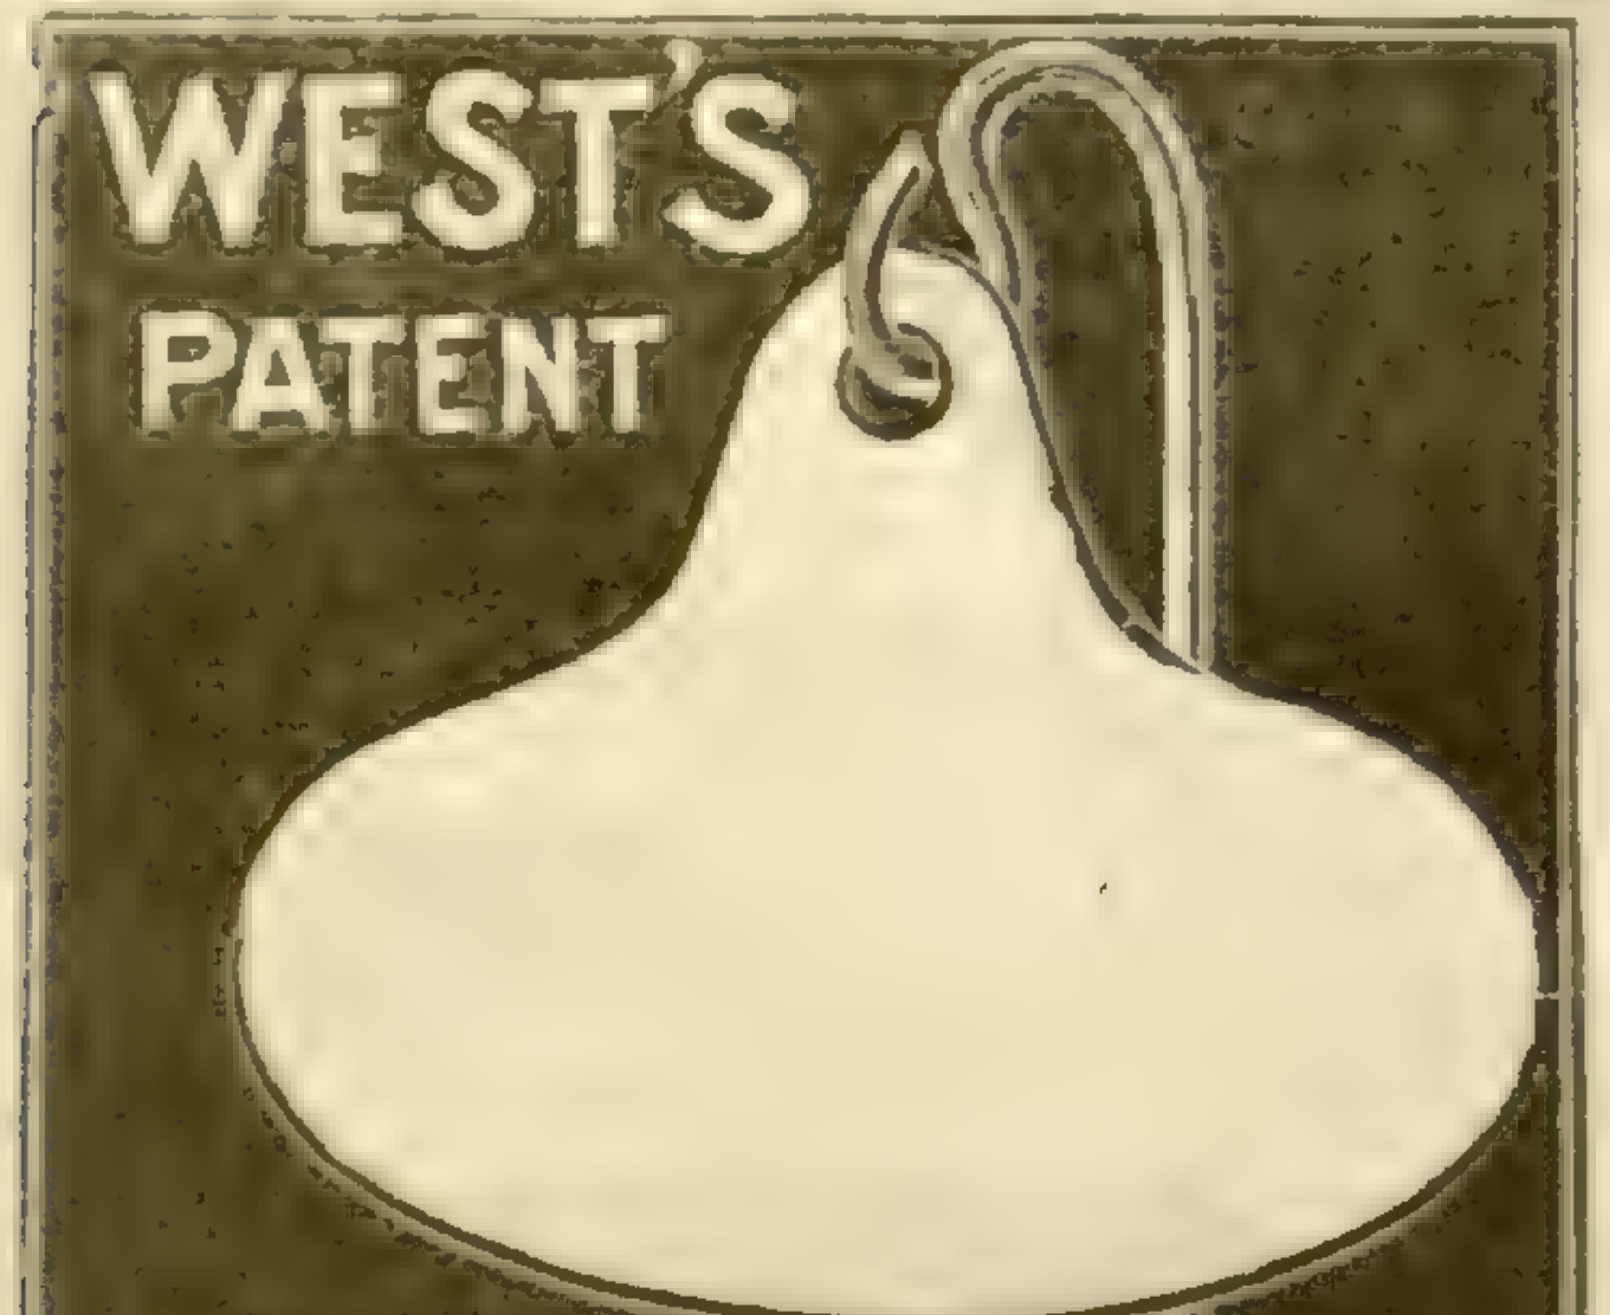
Quality of work unsurpassed. Lowest prices possible.

W. RICHARDSON & CO.,
DARLINGTON.



THE "IVORINE" WRITING DISC, being made of a Celluloid and Xylonite composition, is imperishable, and does not corrode or eat away, like wood and metal labels; and being ivory-white, when written upon it shows to perfection. And also, as the writing is on the Ivorine itself it is permanent, though washable, and does not become unreadable like all other labels, for hitherto all labels have been painted, as the paint gets old. It is for labelling every description of goods when used with or without the wires, and will last a century, either in a greenhouse, in a wine cellar, or out in a garden, and not only is it always ready for use, and may be written on both sides, but the name when written in pencil may be easily rubbed off, and so used as many times as desired.

Price, **9d.** per dozen; **8s.** per gross, complete; **7s.** per gross without wires, Carriage Paid. Size a little larger than illustration. (See List for other sizes). Send for Lists of the West's Patent Specialities and Samples (post free), and test them by keeping them in water. Special ink, if required, in **7d.** bottles, per post.

Supplied by all Nurserymen, Florists, &c.

The LEEDS ORCHID Co.,
ROUNDHAY, LEEDS.

GREENHOUSES from £3 8s. VINERIES, conservatories, well-made frames, painted or glazed, from 21s.; illustrated price lists free. Maker to H.M. the Queen and H.R.H. the Prince of Wales.

Manufacturers, London Works, Reading.
(Name Paper.)

SANKEYS' famous GARDEN POTS

✻ Bulwell Potteries, Nottingham. ✻

Messrs. Dicksons, Limited, Chester, write; "The Flower Pots you have so largely supplied us with are light, strong, and well made, and in every respect highly satisfactory."

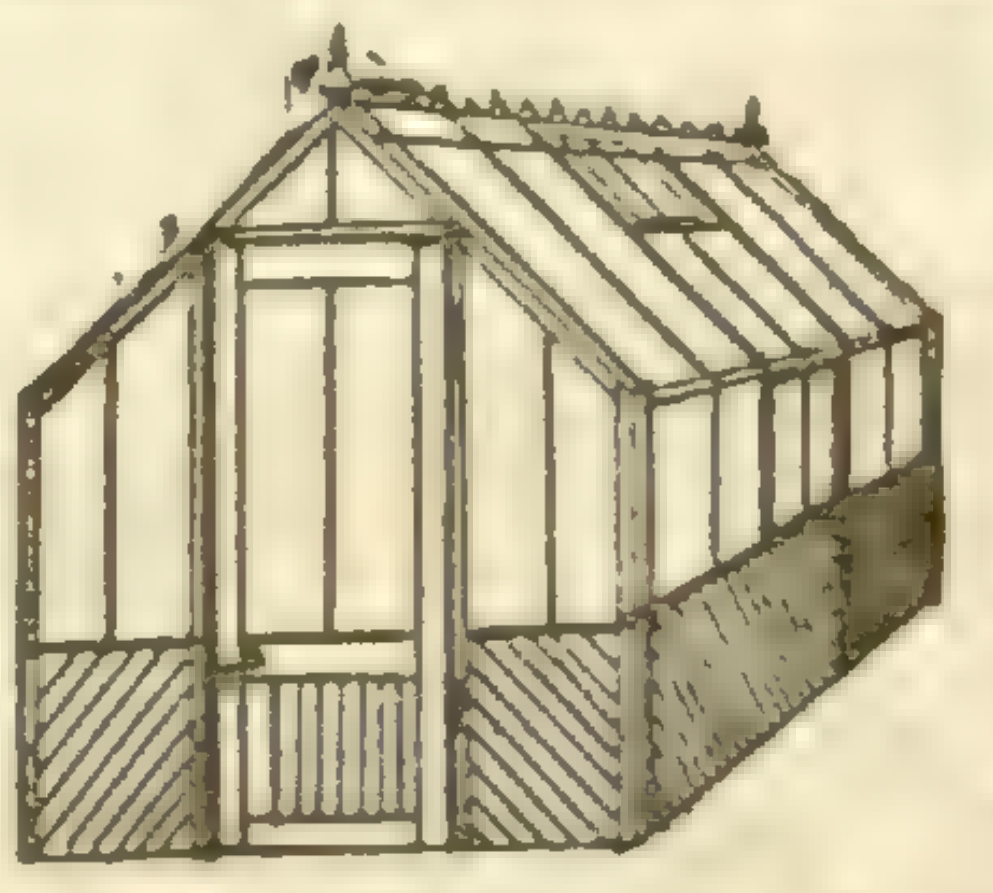
Messrs. Richard Smith & Co., Worcester, write "We beg to say that we are highly satisfied with your Garden Pots.' They are well made, light, yet strong, and we like them better than any other we have ever used."

Messrs. Fisher, Son, and Sibray, Limited, Handsworth Nurseries, Sheffield, write: "We have pleasure in testifying that after having used your pots for the past twenty-five years, we have found them all that could be desired."

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

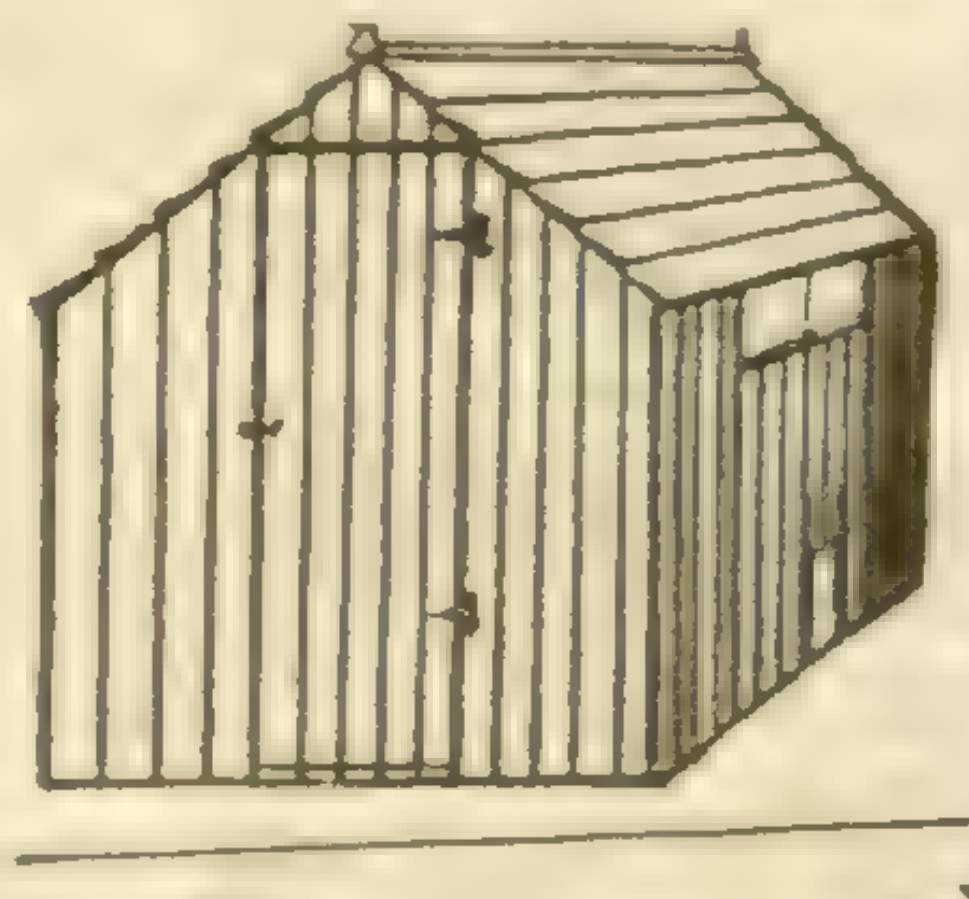


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72/6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison :—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more.

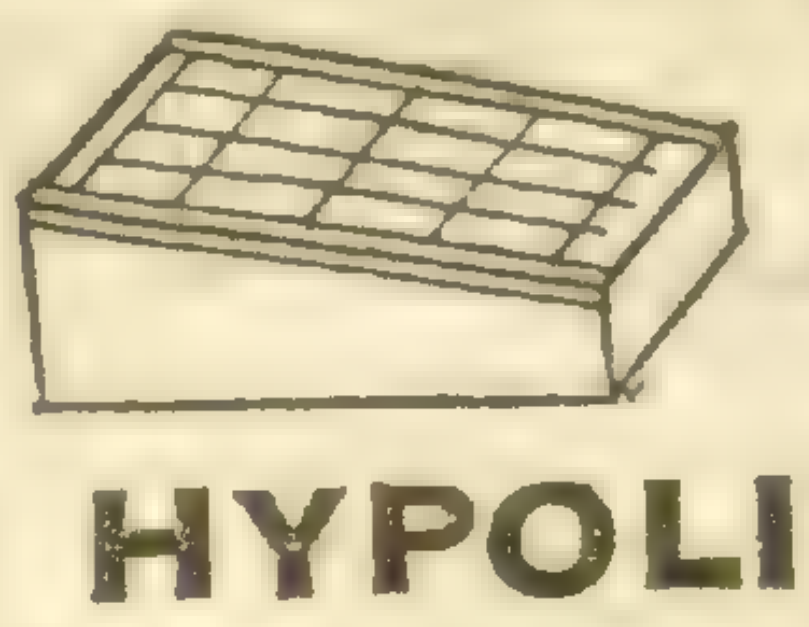
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to.	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred...	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half-inch wood, these are one-third thicker, and felt cover to roof.



4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply [illegible]

To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.

Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

THREE INSERTIONS FOR THE PRICE OF TWO!

A LADY, giving up her establishment, wishes to highly RECOMMEND her gardener (Head-Working); experienced in all branches; married; fifteen years' character.—J. M., The Gardens, Eversfield, Reigate.

AS GARDENER (Single-Handed, or with boy); thoroughly experienced; Inside and Out; good references.—Apply F. C., 24, Bennett Street, Buxton, Derbyshire

AS GARDENER (Single-handed); experienced; Inside and out; good reference; three years' place; age 23; abstainer.—Apply J. G. C., 8, Warners' [illegible] Church Gate, Loughborough.

FLORIST, Junior Assistant; three and a-half years' experience in wreaths, seeds, plants, &c.; character.—Apply C. JOYCE, care of Mr. Hayes, Westleake, [illegible].

GARDENER.—Admiral Sir W. G. Luard wishes to RECOMMEND his Gardener as HEAD, where two or more are kept; thorough practical man inside and out; ten years' reference; age 30; married, one child.—R. S., Lodge Cottage, Witham, Essex.

GARDENER (Head); age 36; married, no family; first-class fruit, plant, and vegetable grower; twenty years' practical experience; highly recommended.—W. COLEMAN, 2, Montague Road, Datchet.

GARDENER (Head, where more are kept, or good Single-Handed); eighteen years' experience in all branches of gardening; good references; married, no family; age 33; please to state wages given.—E. POST, Drayton House, Ealing, W.

GARDENER (Head, or good Single); good all round man; Inside and Out; life experience; age 40; married; wife help in house if wanted; good characters present and previous employers.—F. OSBORNE, The Gardens, Corner Hall, Hemel Hempstead.

GARDENER (Head-Working, or good Single-Handed); nine years' practical experience with [illegible], cucumbers, &c; stove and greenhouse plants; flower and [illegible] garden; abstainer; age 24; married when suited; can be well recommended; good character.—F. HAWKINS, Littlebourne, Dover.

GARDENER (Head-Working, where two or three are kept); experienced in all branches of gardening; age 38; married, one child; six years in present situation.—Address F. GOODWIN, Duns Tew, Deddington, Oxon.

GARDENER (Head-Working); married; life experience Inside and Out; disengaged, establishment being sold; abstainer; good character; references previous places.—E. TOWNER, 18, Houselands Road, Tonbridge.

GARDENER (Head-Working, or good Single-Handed); understands greenhouse, flower, and kitchen garden; age 30; married, no family; good character.—W. M., Cottage, Crofton Hall, Orpington, Kent.

GARDENER (Head-Working); age 30; life experience; thoroughly understands flowers, fruit, and vegetables, including orchids and carnations; well recommended by past and present employers.—J. DAWSON, Rangemore Gardens, Burton-on-Trent.

GARDENER (Single-handed or Second), where three or four are kept; nine years' experience; age 25; first-class references.—B., Fortismere Cottage, Fortis Green Road, East Finchley, N.

GARDENER (Single-Handed, or with assistance given); age 34; married; experienced in all branches.—C. TRANSOM, 53, Danbrook Road, South Streatham, S.W.

GARDENER (Single-Handed, or one Under); age 27; twelve years' experience; Inside and Out; three years in present place; married when suited.—For references apply J. SYKES, 18, Percy Terrace, Hendon, Sunderland.

GARDENER (Single-Handed); age 48; married; fourteen years' good reference; understands greenhouse, flower, and kitchen garden.—Address W. SHUTTLE, 5, Stoneyard Place, Lee, Kent.

GARDENER (where assistance is given); age 38; well up in stove and greenhouse plants, vines, peaches, cucumbers, and melons; flower and kitchen garden; good chrysanthemum grower; good references.—E. POSNETT, 38, Olinda Road, Stamford Hill, N.

GARDENER (Second, or Single-Handed); ten years' experience; Inside and Out; age 23; good testimonials.—G. G., 39, Evelyn Street, Deptford, S.E.

GARDENER (Under); age 22; Inside and Out; seven years' practical experience in good establishments; excellent references; please state wages; abstainer.—F. CLARK, Chilgrove, Chichester.

HANDY-MAN on Gentleman's Estate, Carpenter, Painter, Glazier, and Paperhanger; willing to make himself useful; age 37, married; two children, girls, ages 3 and 10.—E. S., 15, Cuthbert Road, W. Croydon.

MAN, young, SEEKS SITUATION on Gentleman's Estate, or Caretaker; good plumber, gas and hot water fitter; handy at other branches; long references PLUMBER, 18, Beversbrook Road, Upper Holloway, London, N.

MARKET GARDENERS, Fruit Growers, or Gentlemen.—MANAGER, well educated, life experience of Market Gardening, Fruit and Mushroom Growing; an excellent salesman; first-class references.—F. MARTIN, Ivy Cottage, Staines Road, Hounslow.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries. Worcester.

SITUATION WANTED by young man; age 20; Inside and Out preferred; two and a-half years' good character from last situation.—Address W. GREEN, Back Road, Old Catton, Norwich, Norfolk.

TO GARDENERS.—A Young Man, age 30, married, two children, WANTS SITUATION in private place, where there are grapes, strawberries, any sorts of tomatos, and would help in kitchen garden.—W. S., 4, Brier Terrace, Broadwater, Worthing.

UNDER-GARDENER, age 19, SEEKS SITUATION; six years' experience; Inside and Out total abstainer; disengaged.—H. [illegible]INNEE, Sudbury Grove, Sudbury, Harrow, Middlesex.

YOUNG MAN, strong, active, well-educated, desires to acquire knowledge of Fruit Farming and general Horticulture; willing to accept small wage.—F. T., Mrs PEARSON, Dean Street, Liskeard, Cornwall.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

THE CHRYSANTHEMUM RUST.

As shown by the large number of infected specimens that we have received from our correspondents, the disease popularly known as the Chrysanthemum Rust has become so general throughout the United Kingdom as to justify in some degree the apprehensions of cultivators, and especially those who purpose taking part in the competitive gatherings. Much damage has unquestionably been done by the disease, and further injury may be anticipated; but we do not share the views of cultivators who regard the fungus causing the disease as invincible. It is not, in our opinion, a case for undue despondency, but one for increased activity, and we would, therefore, suggest that, instead of considering the question of abandoning the growth of the chrysanthemum because of the ravages of the disease, as we know some growers are doing, active steps should be taken to check the ravages of the fungus. Holding these views, we are extremely pleased that, on the initiative of Mr. Percy Waterer, the Committee of the National Chrysanthemum Society has accepted its responsibilities, and at the meeting held on Monday it decided to hold a conference for the purpose of discussing the scientific and practical aspects of the disease. This will be held at Westminster on the evening of the opening day of the October exhibition, and it should be one of the most useful of the conferences held by the Society; moreover, having regard to the importance of the subject, there should be a large gathering. As we have submitted diseased specimens to one of the most distinguished authorities on fungi, for report, there is no occasion for entering into details with regard to the rust; and it will suffice to say that in dealing with this, as with other plant diseases of fungoid origin, the cultivator must rely almost exclusively upon preventive measures in his endeavour to check the disease. When the plants have become infected with the fungus, but little can be done beyond sponging the leaves with a solution of sulphide of potassium, in accordance with the advice given on several occasions in these pages; the object in laving the leaves is obvious, and the sponging is recommended for the purpose of preventing the distribution of the spores over the healthy foliage. Another important preventive is syringing the healthy plants with sulphide of potassium in solution with a view to prevent the germination of the spores when they settle upon the leaves. A still further aid to prevention will probably be found in a more natural method of culture, for if the artificial manures so largely employed do not produce the disease, as some growers believe, their excessive use unquestionably predisposes the plants to attack. We have evidence of this in the fact, that while the majority of the plants cultivated by Mr. Waterer for the production of exhibition blooms have been attacked, those grown in the open borders without receiving supplies of stimulative manures have wholly escaped. There can be no question that the excessive feeding of chrysanthemums grown for the production of exhibition blooms has a very injurious effect on the constitution of varieties, and it is highly satisfactory to know that the practice, first suggested by Mr. Gordon in these pages, of growing plants under natural conditions for the supply of cuttings has become general, for had the old practice of propagating from plethoric individuals been continued the results by this time would have been so disastrous that we gladly turn from their contemplation.

PLANT SURGERY.

It not unfrequently happens that pot plants, ferns especially, gradually go out of condition, first of all losing that robust tint of green characteristic of healthy plants, and then throwing up smaller and smaller fronds, until eventually they dwindle entirely away, the winter probably putting the finishing touch. In the majority of cases it is not so much neglect as overcare or coddling which leads to this, and too frequent watering, with resulting impoverishment of the soil, is often at the bottom of the evil. When, however, this dwindling process has fairly set in, it is invariably seen that the centre of the plant only is really alive, and that this is surrounded by a mass of dead and decayed vegetable tissue and débris, the rottenness of which is slowly invading the living portions, so that unless some drastic measure be resorted to, complete decay is only a question of time. The reason of this is a very simple one, and once grasped indicates the remedy. Every new frond is to a certain extent an independent individual, since not only does it throw up its more or less delicate leafy portion, but from its base it sends down a number of roots peculiar to itself, and destined mainly for its own support. Now, when once, from any cause, decay has set in in the outer parts of the crown, these new roots find themselves, immediately they start out in search of nutriment, confronted by this rotten material, which, in nine cases out of ten, they fail to penetrate, become themselves infected with the germs of decay, and so never reach the nourishing soil beyond. Hence the fronds they spring from, being handicapped in this fashion, only partially develop, and usually fail altogether on the tips; the next series of fronds, are, of course, still worse off, and so the malady spreads, unless a surgical operation be effected as follows: Shake the plants thoroughly free of soil, and wash the roots perfectly clean; then with a sharp knife carefully cut away the whole of the dead roots, and also all the decayed portions of the root stock, taking care during the operation that the central axis of growth is not damaged in any way. When this is done, little probably remains, especially if the evil has nearly run its course, but if this remainder be now potted up in as small a pot as will hold it and kept close, it is astonishing how soon its vitality will be reinvigorated, and fresh growth begin. In some cases with the polystichum, a little bottom heat will have the result of inducing a profuse bulbiloid growth all over the rootstock, and it is on record that one of the finest varieties existing dwindled as described to the last spark, and being treated as above, yielded no less than eighty plants, a very fair recompense for the trouble involved.

TAKING NOTES.

It is an unfortunate fact that the capacity for intelligent observation is not always allied with a habit of noting down, for the general benefit, the experience thereby gained. The memory itself is a treacherous friend, and in any case is solely the servant of the owner of those particular brain cells in which it is subtly stored; a note-book, on the other hand, in which records are made at the time of observation, not only refreshes its keeper's memory in the future, but in its very use defines his thoughts with greater clearness. To note down a thing in writing necessitates a definition, and induces closer observation to obtain it, so that scientifically, a clearly explained note made immediately from observation is far more valuable evidence than a record made from memory. The one is, as it were, a snap-shot with a camera, and the other a sketch from remembrance. Many a man, however, who devotes himself to some special pursuit; follows this up year after year; forms, perhaps, a valuable collection, or raises, may be, a host of new things, acquiring in the process an invaluable fund of knowledge; but, on inquiry, we find that no notes are made or kept, the wisdom acquired is of a confused and rule of thumb description, and when the man dies the world, so far as his particularly-acquired experience is concerned, is no whit the richer. Another man, plodding along systematically, though he may not reap a tithe of the practical success of the other, has recorded carefully what he has seen, and by so doing added some solid grains of knowledge to the scientific pyramid. The world of Nature is full of facts, big and little, gigantic and microscopic, through the study of which man learns her secrets. A lesson is inwrought with the minutest of natural phenomena as well as the greatest; every effect is a link in a chain of causes leading back to the profound enigma—the great first cause of all. We plant lovers, watching our plants grow, waging war in their defence with their foes, combatting adverse climatic conditions, or subtly mingling the potencies of diverse species by crossing or hybridising, are brought into peculiarly close communion with biological phenomena which are fraught with instructive lessons. Starting with our note-book, we may at first find but small encouragement, so diverse and unconnected will our observations appear; but depend upon it, if we continue, we shall find, first, a recurrence of similar cases, then differences will appear, and eventually, still pursuing our quest, lines of orderly law will gradually reveal themselves, especially if, as we should do, we profit simultaneously by the knowledge gained by previous workers, and clearly recorded by them. Science, indeed, is like a coral growth, it is a slowly-built, concrete erection, composed of tiny, but always solid, atoms of wisdom, secreted and built upon a definite plan to form a coherent and homogeneous whole. The man without a note-book is like a floating, unattached coral insect, which, while it assimilates the needful pabulum around it like the others, secretes nothing, adds no particle to the structure, and consequently lives in vain.

Conference on the Chrysanthemum Rust.—In consequence of the injury done by the disease known as chrysanthemum rust, the General Committee of the National Chrysanthemum Society appointed, at its meeting held on Monday evening last, a sub-committee consisting of the officers and Mr. George Gordon, to organise a conference to be held on the evening of the first day of the society's October show, for the purpose of discussing the several aspects of the disease. The sub-committee has arranged for a paper by Mr. P. Waterer, vice-chairman of the committee, on the "Practical Aspects of the Chrysanthemum Rust," and one by Mr. George Masse on the "Scientific Aspect of the Fungus Causing the Disease." The conference will be held in St. Stephen's Hall, and the chair will be taken at six o'clock.

"Bacterial Disease" of the Potato.—For many years past American cultivators of potatos, tomatos, and other solanaceous plants have had heavy losses annually inflicted upon them by a disease, which the American scientists believe to be caused by bacteria, the species responsible for the disease being described under the name of Bacterium solani. The disease has caused some damage to potato and tomato crops in this country, more especially to the latter under glass, and therefore is something more than of academic interest to cultivators in the United Kingdom. Professor Marshall Ward has investigated the disease, and as the results of his investigations he is convinced that it is not due to bacteria, but to a true hyphomycetous fungus. The way into the tuber is prepared for bacteria by fungus hyphæ, and the open passages of destroyed vascular bundles afford them ample space. Investigations not yet completed by Professor Ward indicate that after the fungus in question has opened up the way into the tuber, all sorts of bacteria and fungi can make their way down the destroyed vascular strands and reappear in spring, when the tubers are replanted. The evidence shows that the fungus in question, once in the tuber, leads a dormant life during the early part of the winter, but gradually invades the new sprouts as they slowly appear in the early spring, and that the parasite is actually replanted by the farmer or gardener when restocking the ground in his new "sets."

The Swanley Bees appear to have become demoralised by the sweetness emanating from the jam factory situated in their midst, for according to the newspaper reports, they raided the establishment and for a time compelled the operatives to suspend work. They were not allowed to enjoy the sweets of victory for any length of time, for measures for their suffocation were decided upon, and in the result sufficient numbers to fill three bushels lost their lives as the penalty of their departure from the path of rectitude.

Incense Trees of the West Indies.—There are apparently several very distinct plants known as "Incense trees" in the West Indies, and according to the *Kew Bulletin*, the most widely distributed and best known of these is Bursera gummifera. This is the "Birch tree" of Jamaica, the "Gommier" of the Windward and Leeward Islands, and the "Turpentine tree" of St. Vincent. There are specimens in the Kew Herbarium also from Cuba, Florida, Mexico, and Guatemala. It has pinnate leaves with small precocious flowers. In his report on the forests of Jamaica Hooper describes it as a "tree of the coast and coast ranges; a smooth-barked, erect, deciduous tree, from its clean stem and its habit of branching only at the top adapted for live telegraph posts. As a timber used in coopering." Macfadyen states that all parts of the tree produce a gum capable of being substituted for gum-mastic as a transparent varnish. In the Kew Museums there are "flambeaux" from Dominica, said to contain the resin of this tree wrapped in leaves of the Balisier (*Heliconia* sp.), and in the spathe of *Euterpe montana*. It is doubtful whether this resin in every case is really from Bursera gummifera. Dr. Imray, who has also sent a gum resin from Bursera gummifera, refers to it as "the large Gommier tree."

The Prothallus of Lycopodium clavatum has been investigated by Mr. W. H. Lang, of the Glasgow University, and some interesting results obtained. Mr. Lang states: A few prothalli of the species in question were found wholly imbedded in the peaty soil underlying a patch of moss; three of them bore young plants and a number of slightly older plants, the prothalli of which had disappeared, were found in the same spot. The prothalli, which present a general resemblance to those of Lycopodium annotinum, are of considerable size, completely devoid of chlorophyll, and fairly well provided with rhizoids, especially round the edge. Their form is that of a thick fleshy cake, which soon becomes thrown into folds by the unequal growth of the margin. The upper surface is concave, owing to the sides becoming turned up at an early stage. The sexual organs are borne on the upper surface; both antheridia and archegonia may be present at the same time. These resemble the sexual organs of other lycopods. Even after the young plants have attained a length of several inches the large, almost spherical, foot can be distinguished. They are similar to those of Lycopodium annotinum; no trace of any organ corresponding to the embryonic tubercle of Lycopodium cernuum is visible, and the leaves exhibit a gradual transition from simple scales to the form characteristic of the species. A broad layer of tissue separated from the under surface of the prothallus by one or two layers of cells contains an endophyte fungus, the mode of occurrence of which suggests that it is of the nature of a mycortiza.

Influence of Electricity on Growing Plants.—At a meeting of the Mathematical and Physical Science section Association, Professor S. Lemström described some experiments that had been made with a view to determine the action of electricity on growing Plants. After a brief sketch of previous experiments on the subject made in 1885 and 1886, he referred to the researches which he carried out last year on the Estate Brödtorp, with the friendly assistance of the proprietor, Baron Edvard Hisinger. Three fields of 50m. were used for the experiments, and three of the same area as control fields. In general there was found an increase in the seeds of at least 40 per cent., in the roots from 25 per cent. to 75 per cent., depending on the kind of plant and on the nature of the soil; in beans 75 per cent.; in strawberries and raspberries as high as 75 per cent., the time for their ripening being shortened at least one-third. The experiments proved, among other things, that electricity given to plants during days with a clear burning sun might damage them very much if enough water was not also given at the same time. Discussing in what way electricity exerted an influence on plants, the author said that either the gases in the air were transformed to ozone and nitric oxides, which, being heavy, fell down upon the plants and increased the activity of their vegetation, or the electricity induced the juices of the plants to ascend more rapidly in their capillary tubes (the Gernez phenomenon). Though much has yet to be explained, the method is ready to be used for practical purposes. The author this summer carried out experiments in Finland on some especially interesting plants. Of these the tobacco plant did not yield, in earlier experiments, to the favourable influence of the electric currents, through want of water. Photographs of the experimental and the control field, which were watered to the same extent, were taken at the same distance from both fields, and showed that under the influence of the current the results were at least 40 per cent. better than without it. The current was applied for four hours in the morning and four hours in the afternoon, with many interruptions, however, from June 17 to July 30. The total number of hours was 161. Dr. E. H. Cook read at the same meeting a paper on a similar subject, and in this he described results agreeing with those of Professor Lemström. Electrically urged plants were found to come to maturity sooner, but electricity had very little effect after the cotyledons appeared above the soil, the accelerating effect being exerted on the seed and the young plant. The electricity was applied in various ways, with the same result in each case.

Grants to Botanists.—We learn that the Berlin Academy of Science has granted five hundred marks to Dr. Loesner for the completion of his monograph of the Aquifoliaceæ; six hundred marks to Professor Graebner for the continuation of his investigation of German heaths; and two thousand marks to Professor Eichler for the continuation of his extensive work upon East African plants.

Manurial Requirements of Potatos have been fully investigated at Rothamsted, and the recently-issued report on the field and other experiments, conducted on the farm and in the laboratory of Sir J. B. Lawes, contains some interesting particulars relating to the use of fertilisers in the culture of potatos. These experiments were commenced in 1876, so that 1898 is the twenty-third year of their continuance. The descriptions grown were Rock, four years; Champion, eleven years; Sutton's Abundance, five years; The Bruce, one year; and White Beauty of Hebron, 1897 and 1898. The question was not as to the comparative merits of different descriptions, and different sorts were selected on the supposition that in growing the crop year after year change was desirable, especially with a view to the avoidance or lessening of disease. The special object was to ascertain the manurial requirements of the crop, and the comparative characters and composition of the produce. The crop was grown continuously without manure, with various artificial manures, and also with farmyard manure, both alone and with some artificial manures. There were ten differently-manured plots, and under each of the ten conditions the crop more or less declined over the later compared with the earlier years. The average produce per acre of total tubers over the twenty years was—without manure, only 1 ton 11½ cwt.; with ammonium salts alone, 1 ton 18½ cwt.; with nitrate of soda alone, 2 tons 8 cwt.; with superphosphate alone, 3 tons 2¼ cwt.; with mixed mineral manure, including potash, 3 tons 6¾ cwt. Thus, purely nitrogenous manures yielded less than purely mineral manures, indicating that there was a deficiency of ash-constituents rather than of available nitrogen within the soil. With the mixed mineral manure and ammonium salts together, the average produce of total tubers was nearly six tons, and with the mixed mineral manure and nitrate of soda rather over six tons per acre. The better result by the nitrate of soda is doubtless due to its nitrogen being more immediately available, and more rapidly distributed within the soil, and so inducing a more extended development of feeding roots. The average produce by the mineral and nitrogenous manures together, over twenty years of continuous growth, was very nearly that of the estimated average produce of Great Britain under ordinary cultivation, and much more than that of Ireland. It was also more than the average of any other country in Europe, much more than many of them, and about three times as much as that of the United States.

Devon and Exeter Gardeners' Association commenced their [illegible] session on Wednesday evening with the annual meeting. The subjects arranged for discussion at the meetings to be held before Christmas are as follows: October 12, "Flowers that Bloom in the Spring," by Mr. Andrew Hope, hon. secretary; October 26, "Vine Culture," by Mr. George Lock, Newcombes Gardens; November 9, "Deciduous Trees," by Mr. F. Edwards, Honeylands Gardens; November 23, "Further Experiments with Chemical Manures applied to Garden Crops," by Mr. F. W. E. Shrivell, F.L.S., Thompson's Farm, Tonbridge, Kent; December 7, "The Honey-Bee, and why it should interest Gardeners," by [illegible] Walker, Lee Ford, Budleigh Salterton.

Importation of Canadian Fruit.—It is evident the fruit growers in this country will have to meet a still keener competition, for we are [illegible] larger supplies, more especially of pears, from Canada. Professor [illegible] who has recently visited this country for the purpose of becoming more intimately acquainted with the British markets, has made arrangements for the first trial shipment for this year of the choicer kinds of fruit, which are to be sent to the United Kingdom under the auspices of the Dominion Government. With reference to the arrangements that are being made for the shipment of the fruit, Professor Robertson states: "The fruits to be sent are pears, peaches, tomatos, plums, and grapes. The fruit growers of Canada are finding that the Canadian home markets are fully supplied now, and that when there is a full crop the markets become so glutted that they can barely obtain living prices. If an outside market could be reached with the fruit in good condition, so as to obtain satisfactory prices, the surplus could be sent there, leaving a better demand in the home market. The only market available for Canadian fruits seems to be that of Great Britain. The Minister of Agriculture and myself in our investigations this year in the old country found a growing demand for fine fruits. Pears are becoming more generally sought for by the great body of what are called the middle-class consumers of Great Britain. These supplies in the past have been a few home-grown pears, large quantities imported from France, and considerable quantities imported from California. None of these, except those grown under glass in Great Britain, compare in flesh or flavour with the finest Bartlett pears from Canada. Now that cold storage has been provided, it has been demonstrated by the trial shipments last year that pears can be landed in Great Britain in first-class condition. The smaller packages which were recommended by the Department of Agriculture last year are being entirely used this season, with every prospect of complete success. The demand for pears in Great Britain this year is unusually good, owing to the partial failure of the home crop, and not very large supplies from France."

Protecting the Edelweiss.—Laws have been passed in Styria and Carniola for the protection and preservation of edelweiss. The much-prized Alpine plant is, it seems, in danger of extirpation in consequence of the increasing number of tourists visiting the Austrian Alps and of the export of the plants with the roots.

Alpine Strawberries in their improved forms are agreeable adjuncts to the breakfast table as well as useful for dessert during late summer and autumn, and as Mr. J. Hudson, who has been eminently successful in their culture, so well observes, when once a taste has been acquired for them their culture will not be readily relinquished. Writing with reference to their cultural requirements, Mr. Hudson says: The culture of the Alpine strawberry is of the simplest description. Seedling plants are infinitely better than those obtained from runners. The old plan of propagation by runners did nothing to increase its popularity, rather otherwise. Plants raised from runners lack in a remarkable degree the vigorous constitution of seedlings, whilst they are not so fertile, nor so [illegible] in bearing. The seed may be sown in a cold frame in April, or in the open ground in May, similar to hardy annuals, a moist, cool, shaded spot being [illegible]. The seedlings should be transplanted once or twice, being finally put out [illegible] eighteen inches from plant to plant, October being the best month for the purpose. These plants, if well attended to, will commence to bear fruit in [illegible] following, being as early as the best known of the early kinds of the [illegible] strawberry, but will yield a continuous supply until the middle of [illegible], covering a period of four months. The season may be further extended [illegible] end of October if ordinary garden frames be placed over them, whilst under more favourable climatic conditions the season can be further prolonged. When the fruit is all picked the plants can be destroyed, or a portion of them, those [illegible] being kept for the first crop another season, these being again succeeded [illegible] plants, which in that case can have their first flower spikes cut off, so [illegible] strengthen the plants. The runners, which are produced freely, [illegible] be cut off. Almost any soil, but preferably a light one, will suit them, [illegible] strawberry delights in moisture and a moderate amount of shade, hence [illegible] to other fruits may be utilised for this.

The Midland Daffodil Society is the most recent addition to the organisa[illegible] have for their object the promotion of floriculture, and, considering the [illegible] judgment evinced in the management of the floricultural societies that [illegible] at Birmingham, a long and useful life may be anticipated for it [illegible] confidence. The ruling spirits are Professor W. Hillhouse and Mr. [illegible], who occupy the positions of chairman and treasurer respectively. [illegible] prizes offered for competition at the exhibition to be held in the [illegible] Gardens, Edgbaston, on Thursday and Friday, April 13 and 14, contains [illegible] classes, the most important being that for a collection with a silver cup [illegible] Messrs. Barr and Son as the premier award.

The Boston Society of Natural History is continuing its good work [illegible] encouragement of natural history investigation. It annually offers two [illegible] sixty and fifty dollars respectively for memoirs on specified sub[illegible] to be sent in by April 1st of the year mentioned, and to be [illegible]. The subjects for 1899 are: (1) Is there fundamental [illegible] "equation division" and "reduction division" in the division [illegible] (2) The phenomena and laws of hybridisation. The subjects for 1900 [illegible] and correlation of the sedimentary formations of any part of [illegible]. (2) A study in palæozoic stratigraphy and correlation.

China Grass is steadily increasing in commercial importance, and the full [illegible] of the plants from which that product and Rhea or Ramie [illegible] the preparation of the two fibres for market which appears in the [illegible] *Kew Bulletin* is extremely opportune. Hitherto it has been [illegible] the names of China grass, Ramie, and Rhea indiscriminately [illegible] Bœhmeria nivea and B. tenacissima, and as this has given rise to [illegible] it has been generally agreed to employ them with more [illegible] China grass, it may be stated, is obtained from B. nivea, which is suffi[illegible] grown in the south of England. Ramie or Rhea is the product of B. tenacissima, which in this country can only be grown with the aid of glass. The importance of exactitude in speaking of the two plants is strikingly exemplified by what has happened in India. According to Dr. Watt numerous experiments have been made to extend the cultivation of the bœhmerias in India, but in many instances they have failed because of the attempt to grow the temperate-loving plant instead of the species requiring a high temperature for its successful cultivation. The fibre of each of the two plants is of much value in the manufacture of various fabrics, but in consequence of the difficulty of cleaning the fibre except by hand the supplies are limited and high in price. Numerous attempts have bee made to dispense with hand labour, and during the past five or six years considerable advances have been made in the machines introduced for cleaning the fibre, but in the summary of the report we are told that: "Notwithstanding all the expenditure of mechanical skill and inventive ability, the conclusion cannot be evaded that we are still as far off as ever from being able to place upon the market a finished product which will effectually compete with silk, flax, and the better qualities of cotton. The plants can be grown with the greatest ease. But when the problem of treatment is solved, the supply of the raw material will be limited to warm countries. The cultivation of China grass in temperate regions will never be able to compete successfully with that of Ramie (or perhaps of China grass) in the tropics."

Fossil Plants were the subject of some interesting notes contributed by Dr. D. H. Scott to the botanical section of the British Association. In the first of the notes he dealt with "a fine specimen of the Halonial branch of a Lepidodendron allied to L. fuliginosum." This specimen (of which a photograph was exhibited) was recently discovered by Mr. Lomax at the Hough Hill Colliery. Is is of large size, with the structure perfectly preserved, and bears two series of Halonial tubercles. The main stem resembles that of Lepidodendron fuliginosum, though not absolutely identical. Each tubercle has its own vascular cylinder, surrounded by leaf-trace bundles, and evidently represents a branch, which probably constituted the peduncle of a strobilus. In the second of his communications, Dr. Scott referred to an English Botryopteris, and specimens were described showing that Rachiopteris tridentata is the petiole of Rachiopteris hirsuta, a simple monostelic fern-stem. It was further shown that the plant agrees closely in structure with the peculiar group of fossil ferns described by M. Renault under the name of Botryopteris, and that it should be placed in that genus. Dr. Scott, in his note on the structure of Zygopteris, pointed out that undescribed specimens, from the Williamson collection of the fern Rachiopteris Grayi, which is no doubt a Zygopteris, showed the anatomical structure more perfectly than any previously investigated. The stem has a very complex organization, though of the monostelic type; the leaves have a 2-5 phyllotaxis; and the vascular strand of the axiliary shoot is given off from the foliar bundle a short distance above its base.

An Ancient Oak Tree was recently unearthed near Broxbourne during the excavations for a new gas holder at the Hoddesdon Gas Works. The specimen was about twenty feet long and had evidently been trimmed of its branches; the outer two inches of wood were quite soft, but the heart wood, though perfectly black, was quite sound. No doubt this ancient oak floated from the place where it was cut down to the point where it was found, at a period when the River Lea had a much wider bed than now; some idea of the age of the tree is to be gathered from the deep clay and other deposits overlaying the gravel bed in which the trunk was embedded some twenty feet below the surface.

Potatos in Great Britain.—According to the returns published by the Board of Agriculture the potato crop in Great Britain occupied this year 524,491 acres. In England there were 365,432 acres under potatos, or 69·7 per cent.; in Scotland 126,362 acres, or 24 per. cent.; and in Wales 6·3 per cent.; these representing increases of 13,067 acres, 6,422 acres, and 188 acres respectively. The counties of Cornwall, Norfolk, Rutland, Sussex, Warwick, and Worcester record small decreases in area, but in all other English counties potatos were this year planted upon an extended acreage, the largest increases amounting to 1,684 acres in Lincoln and 1,521 acres in Chester. The largest areas of potatos are 51,881 acres in Lincoln, 38,308 acres in Lancaster, 24,773 acres in Chester, 23,680 acres in the West Riding of York, 19,849 acres in Cambridge, 13,276 acres in Kent, and 12,547 acres in Devon. In seven English counties the area of tubers falls below 2,000 acres. The trifling alteration in the acreage under potatos of Wales is the outcome of an extension of area in seven counties and a diminution in five. The largest county area is 5,989 acres in Cardigan, the smallest is 885 acres in Radnor. Two English counties, Lincoln and Lancaster, each possess a larger acreage of potatos than the whole of Wales. Excepting for decreases of the most trivial dimensions in Nairn, Renfrew, Selkirk, and Shetland, all the counties of Scotland participate in the extension of potato acreage, the largest additions being 969 acres in Perth, 938 acres in Fife, 583 acres in Mid Lothian, and 536 acres in Forfar. The greatest county areas of potatos are 14,264 acres in Fife, 12,385 acres in Perth, 11,965 acres in Forfar, 7,686 acres in Haddington, and 7,523 acres in Ross and Cromarty. The smallest is 188 acres in Selkirk, and there are five other counties in which the area falls short of 1,000 acres.

S. S. Marshall, Limited.—This company has been registered with a capital of £15,000 in £1 shares for the purpose of acquiring and carrying on the business of a nurseryman, horticulturist and market gardener, carried on by Mr. S. S. Marshall, at Barnham, Sussex, and elsewhere. The number of directors is to be not less than three nor more than five, and the first directors are to be Messrs. S. S. Marshall, W. W. Pewtree, P. Goodacre, and C. Stride.

A Fasciated Vegetable Marrow growing in the garden of Mr. Flood, at Tonbridge, appears to have created considerable interest, judging from a paragraph in one of the local papers. The plant is evidently regarded as a great curiosity, but there is nothing remarkable in vegetable marrow plants producing fasciated stems.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

FROM time to time i is my custom to jot down ideas for treatment in this column at a convenient or opportune moment. Frequently such ideas seem at the moment of their inception to be of the utmost brilliancy, But, unfortunately, before the convenient or opportune moment arrives a change has taken place. Usually it is brought about by Peter. I make a practice of submitting them to him in advance, for the reason that his opinions are held in such high estimation by readers of this paper, but in nine cases out of ten he pours cold water on them with an unsparing hand, after which he proceeds to develop an alternative scheme, supported by arguments of the most decisive, not to say dogmatic, nature. When he has done I am at liberty to say as much as I like, but under no conceivable circumstances does it make the slightest difference. The fiat has gone forth, and there is an end of it.

My latest idea was to create a discussion on the best way in which to arrange for winter study. The long nights, I pointed out, were coming on, and it was of the most vital importance to every young man to learn how to employ them to the best advantage. Now, if a course of study could be marked out beforehand, and the necessary equipment, such as books, provided for, why— But here Peter gave vent to a very loud sniff, the meaning of which was only too well known to me. With a chill and sinking feeling I paused, and begged to know if he could suggest anything better. I believe I imparted a touch of irony to the question, which may or may not have had an effect upon him if he had perceived it. As he did not, speculation is useless. Could he? An indulgent smile spread itself over his face. Well, if he couldn't, he'd, he'd——, but a simile did not come, and I was spared. Eventually, with the air of propounding something desperately and triumphantly original, Peter suggested as a topic—Greens!

Far be it from me to belittle this great subject. As developed by Peter it is one of no common character. He raises greens to the dignity of a national institution, and their culture to a Fine Art. Not only, he contends, does it present a subject that has been unaccountably neglected in the horticultural Press, but it affords a field of study during the coming winter calculated, if prosecuted vigorously, to raise the moral and intellectual standard of our young gardeners to an extraordinary degree. Nevertheless, I am not altogether convinced that he is right. If he is, why then, parodying the parodyist, we may cry :—

> "Hurrah for the curly savoy;
> Hurrah for the young budding sprout;
> Winter greens are my only true joy,
> So I'll leave all the book learning out."

The pungent "A. D." is rather hard on me in a recent issue. Of course, I brought it on myself in a measure, but when I go out of my way to say a word on behalf of the poor, helpless cottager, it is somewhat distressing to have such a painful charge as "tremendous trumpeting" flung at me. One might really imagine from this that the Mixture, which I have always regarded myself as the true reflex of a peculiarly modest mind, was the vehicle for exaggerated laudation of the works of Peter. In reply, I can only say that far from over-estimating the merits of that remarkable man, I only half do him justice. I have now sought his opinion on this onion question. His reply is characteristic, and simply crushes "A. D." (if that hardy old warrior is capable of being crushed). He says—but what he says demands the distinction of a paragraph to itself—

"Now about this 'ere Ail-sir and Cranston's Sell-sir for autumn sowing. Well! all I can say is as we've tried 'em, and its all very well o' these young beginners to try a teaching of *us*. About the Ail-sir; well, its a good name I allow, for it always ails something. And as for Cranston's, why 'tis a sell, sir, there's no getting away from it, 'cause it won't keep nohow. Now I ask—What do we grow Tripolows for? Why, for early use; very well. What do we want 'em to keep for? If we want onions to use in winter and spring, we can get 'em by sowing in March. Very well; then what do we want to sow seven or eight months earlier for, giving ourselves a lot o' unnecessary trouble, and occupying ground that would carry another crop? My idea is that this here 'A. D.' is one o' them young fellers what's got mixed up with them there certificates, else he wouldn't talk about sowing onions eighteen months before they was wanted. We can grow 'em in nine months, but, o' course, not having no certificate [biting sarcasm here—Lux] we're no good."

Having demolished "A. D.," I was disposed to turn Peter upon Mr. Riddell. Ah! I picture that gentleman beginning to quake. But I will let him off more lightly; I will tackle him myself. This shows I am in a merciful mood, not by any means put out by the genial banter, anent somnolency. Let me assure our good friend (1) that I was not dreaming when I wrote of celery on the vine borders; (2) that Peter does not sun himself in it as a vision of the future. It is an accomplished fact. We take good early celery off the vine border, and we have excellent crops of grapes. Is this really so astonishing a fact? Are we alone in it? I think there must be fellow-sinners, if they did but dare to own their delinquency; indeed, I am quite sure that I could put my hand on one famous gardener who should stand in the dock with me, for I learned the trick off him. Mr. Riddell must be indulgent. He must put me down as poor, innocent little Oliver, and hold the other man—the Fagin of the piece—responsible for my wrong-doing. Will this terrible person come forward and be twisted and tumbled in the Yorkshire riddle?

I am the first, my critic says, to state that maltreatment of the roots can be compensated with food. Well, I always like to bring forward some new truth, and I am going to stand by this one right staunchly. Let me put the case in the form of an aphorism, and as I am indulging in so weighty a luxury, perhaps the printer will favour me, for once in a way, with italics: *Roots do not create food, but food creates roots.* Going, in accordance with Mr. Riddell's advice, to the fields, I ask him, "Which fruit trees are the healthiest, those growing in old orchards without culture; left, in fact to Nature, or those in cultivated land, where the soil is annually dug? The roots of the former are never interfered with, yet they dwindle. The roots of the latter are lacerated by the yearly digging, yet they flourish. Why is this? It is because the digging facilitates the admission of air. More food is rendered soluble and more roots form to appropriate it. One famous nurseryman tears bushels of roots from his pot peaches every year, as I have said, but the results are the admiration of everyone who sees his work. According to Mr. Riddell his trees ought to die.

Now take the case of our celery. Perhaps in forking manure into the vine border we pull away some roots. To begin with they are mainly the dead fibrils of the previous year. But even if a certain number of permanent fibres are lacerated, no harm is done that is not balanced by the root-creating medium (manure) applied. Further, it is to be remembered that the vines must benefit enormously by the sewage applied to the celery in the summer. I doubt very much whether the border would get it if the celery were elsewhere, because the supply is limited. But it is practically certain that the celery does not take up all that is applied. What escapes its clutches enriches the soil around it, and myriads of feeders are pushed out by the vines to take advantage of it. Hitherto we have never earthed the celery, but have blanched it with paper. Earthing is a step in advance that may tempt an experiment ere long.

LUX.

DAFFODIL PLANTING.

THE time of year is at hand for the examination of those most popular bulbs, the daffodils. They should be lifted at once, if not already done. A garden spade is the best tool to use, placing it right under the bulbs, but taking very great care that they are not cut or bruised in any way. Some of the varieties increase very fast, so off-sets will require removal away from the mother bulb, and to increase the stock must be planted again. Where a large collection is grown, a reserve garden will be very useful for growing small bulbs in until they have attained a flowering size, which will be from two to three years. The daffodil delights to grow in a moist, loamy soil, of good depth, as the bulbs send out their roots to a considerable distance. Most of the choicer varieties, such as Madame de Graaff, which is one of the largest of the white trumpet forms, and is of exquisite beauty, with drooping habit, have a strong constitution, and are good ones to increase. Mrs. J. B. M. Camm, Mrs. Vincent, Matson Vincent, Glory of Leiden, Madame Plemp, William Goldring, cernuus pulcher, and the Angel's Tears (or Narcissus triandrus albus), Gloria Mundi, with the nearly new Lulworth, all like to be situated on a sloping bank with plenty of sand round about their bulbs; the position should be open to the sun's rays during the whole day.

The earlier the bulbs are planted the better it is for them, as they soon begin to make new roots from the bases of the bulbs. Where a great quantity are grown a wooden dibber is the best tool to plant them with, always having the ground trenched beforehand; and if the soil seems at all poor, or very light, a good thickness of decayed cow-manure should be worked in each trench, but at the bottom, so as not to come into contact with the bulbs. The manure is very beneficial, as it tends to keep the bulbs cool and moist. Some of our trade growers prefer bone dust, which, I should say, is a good manure, and indeed have found it so for pot culture. The bulbs require planting about four or five inches deep, and the same distance apart, taking care to let the bulb rest at the bottom of each hole made by the dibber, for if only dropped half-way down there would be quite a cavity underneath, and the bulbs would do very little good. The ground should be made quite firm before planting, and afterwards raked over to fill up any holes that remain. Carefully place a number or name against each variety, so that it may always be recognised.

A list of a few of the best varieties to grow may not be out of place, omitting the most expensive sorts. Taking long trumpet varieties first, there are Emperor and Empress, Golden Spur, Henry Irving, Johnstoni, Queen of Spain, a most elegant and distinct flower, N. maximus, N. minimus, N. minor, Mrs. H. J. Elwes, N. obvallaris (Tenby daffodil), P. R. Barr, N. rugilobus, Shirley Hibberd, and N. spurius, Dean Herbert, Grandee, Michael Foster, Horsfieldi, N. princeps, N. albicans, and N. cernuus, Mrs. Thompson, with N. pallidus præcox tortuosus, and W. P. Milner. Among the star narcissi choose N. Incomparabilis var. Autocrat, C. J. Backhouse, Beauty, Cynosure, Frank Miles, Queen Bess, very early; Sir Watkin, Titan, and Stella. In the Barri group select N. Barri conspicuus, Maurice Vilmorin, Miriam Barton, Golden Gem, Orphee, General Murray, and Flora Wilson. Among Leedsi forms the best are N. Leedsi, Minnie Hunne, M. Magdalene de Graaff, Mrs. Langtry, Amabilis, and Superbus. Other fine varieties are N. Backhousei and William Wilks; N. Nelsoni, N. Nelsoni major, N. Nelsoni aurantius, N. Nelsoni minor, Mrs. C. J. Backhouse, William Backhouse, N. pulchellus, N. Burbidgei, Falstaff, John Bain, Little Dirk, Model and Constance. Then there are the later sorts, such as N. poeticus, N. p. ornatus, N. p. poetarum, N. recurvus, and N. poeticus plenus (the old double white). These varieties are all good and cheap.

Totley Hall Gardens. T. W. BIRKINSHAW.

HOMOLOGY OF PLANTS.

By Professor F. O. BOWER, D.Sc., F.R.S.

(Continued from page 621.)

Alternation.

But the questions already discussed are mere matters of detail, compared with the great enigma of the alternation of generations in green plants, or of alternation at large. This is, after all, a question of degree of homology, not now of the parts only, but of the whole plant or "generation." How this greatest of all adaptations was really initiated we cannot expect to bring to the point of demonstration; at best we can only venture opinions of probability. Still this discussion commands at present more widespread interest among botanists than any other in the sphere of plant morphology.

There was a time when the attempt was made to reduce all plants to one scheme as regards their life-cycle, a method which not only prevented elasticity of theory, but was responsible for some unfortunate comparisons. It was characteristic of the period when the text-book of Sachs reigned supreme; we find it there definitely laid down that "the doctrine of alternation has the object of reducing to one scheme the main phases of the life of all plants which bear sexual organs." But the controversy between Pringsheim and Celakovsky had, as one of its results, the recognition of various types of life-history, not of one scheme only. The tendency at present is towards the opposite extreme; the frequency of the parallel developments now recognised has led some to accept a comprehensive polyphyletic view as regards alternation, and wherever difficulties of comparison arise, to take refuge in the plausible suggestion that the organisms compared represent altogether distinct lines of descent. But the view which should be confidently upheld is, that even where this may actually be the case useful comparisons may yet be made; and that the method of progress within one phylum may illustrate the probable mode of progress in another. The green Algæ may thus throw light upon the probable origin of the sporogonium in the Bryophytes, though they may in no sense be in the line of their descent; the Bryophytes may suggest valuable ideas for the comparative study of the Pteridophytes, though they may not represent their actual ancestry.

It is the alternation as seen in these green plants that I propose to discuss. Writers have distinguished various types of alternation, including under the term divers modes of "alternation of shoots"; and it should be remembered that this was the original sense of the word alternation as applied by Steenstrup. But gradually the issue in the case of green plants has been simplified, and the question now centres round that alternation of phases which some of us describe as "antithetic," while others believe the phases to be really "homologous" as regards their origin.

Briefly put, the question is, How was the first start made? Has the neutral generation or sporophyte been the result of change of any other part of the sexual generation than the zygote itself? If so, the alternation is of *homologous* generations; if not, then the alternation is what is styled *antithetic.* The whole discussion is like a purely historical inquiry, but with the minimum of documentary evidence; for on this point the fossils give scanty help. In the absence of more direct evidence we are thrown back on other arguments, such as those based on comparison of normal specimens, and secondly upon the study of abnormalities. I shall not attempt to treat the matter exhaustively; it will, however, be necessary for me to deal with certain points in the discussion which were raised in the able address of Professor Scott at Liverpool. He there restated Pringsheim's view of homologous alternation as against the anithetic. I propose now to consider three matters which I think are most material to the discussion, viz.: (1) the bearing of the Algæ and certain Fungi on the question; (2) the comparison from the Bryophyta; and (3) the argument from abnormalities.

I. ALGÆ AND FUNGI.

At first sight those Algæ and Phycomycetous Fungi which show a subdivision of the zygote appear to offer the key to the enigma of the first start of antithetic alternation, and such rudimentary fruit-bodies as those of *Œdogonium* and *Coleochæte* are frequently quoted as prototypes of sporogonia. My own position has been that they may be "accepted as suggestive of similar progress in the course of evolution of Vascular Plants." On the assumption that the zygote is equivalent in all cases—and this is itself a pure assumption—the fruit-body of such Algæ or Fungi would be comparable to the sporophyte in higher forms; but it must be clearly remembered that it is not even then proved to be *homogenetic.* Dr. Scott has based a strong line of criticism of anithetic views upon these cases. He remarks: "The sudden appearance of something completely new in the life-history, as required by the antithetic theory, has, to my mind, a certain improbability. *Ex nihilo nihil fit.* We are not accustomed in natural history to see brand new structures appearing, like morphological Melchisedeks, without father or mother. Nature is conservative, and when a new organ is to be formed it is, as everyone knows, almost always fashioned out of some pre-existing organ. Hence I feel a certain difficulty in accepting the doctrine of the appearance of an intercalated sporophyte by a kind of special creation."

In answer to this, I state that to me the zygote, from which our hypothesis starts, is not "nothing"; it is a cell with all the powers and possibilities of a complete cell. Vöchting, in his "Organbildung," has fairly concluded that "a living vegetative cell which is capable of growth has not a specific and unalterable function." I have myself demonstrated [illegible] typically sporogenous may develop as vegetative tissue, and conversely that tissues normally vegetative may on occasions become sporogenous. We may, therefore, say generally as regards the sporo[illegible], that "a living cell which is capable of growth has not a specific [illegible] unalterable function." This I conceive to have been the condition of the zygote, and of its early products.

I think that the words "intercalation" or "interpolation," as used by writers on anithetic alternation, have been quite misunderstood. I have contemplated no sudden development—indeed, on the first page of my "Studies" I have spoken of the sporophyte as "gradually" interpolated. Nor is the suggested development something "completely new," for I specially speak of elaboration of the zygote. This is the parent of these "morphological Melchisedeks"; and unless segmentation be held to be synonymous with "special creation," I confess I do not see where the initial difficulty arises. I agree that Nature is conservative; what we contemplate is the fashioning of the sporophyte by a process of which the first step is segmentation, out of a pre-existing organ—the zygote. Such simple segmentation is seen in the case of certain Algæ and Fungi, and these may be taken as suggesting how the sporophyte of the Archegoniatæ may have come to be initiated. But I am not aware of having ever suggested that these segmented zygotes of Algæ are the homogenetic prototypes of the more elaborate sporophytes.

Dr. Scott further states that "the reproductive cells produced by the ordinary plant of an *Œdogonium* are identical in development, structure, behaviour, and germination with those produced by the oospore." Professor Marshall Ward, also speaking of *Œdogonium*, remarks, "the attempt to get over this by terming asexual spores borne by the gametophyte *gonidia*, and reserving the term *spore* for bodies indistinguishable from those gonidia by any morphological or physiological character whatsoever, beyond their origin from a so-called sporophyte, carries its own refutation." Now, as a matter of fact, Pringsheim's description and figures of *Œdogonium* give scanty details; in most of the germinating zygotes the nuclei themselves are not clearly shown; much less the details of behaviour of those nuclei on germination. Klebahn has described the fushion of the sexual nuclei in *Œdogonium*, but I am not aware that he, or anyone else, has yet made detailed observations on the nuclear condition of the zoospores, or the changes which take place in the germinating egg. Till this is done I submit that it is premature and undesirable to make such assertions as those of Dr. Scott and Professor Ward. We now know that important nuclear changes do take place on the germination of the zygotes of certain Algæ and Fungi. These changes are connected with a division of the nuclei into four, which is the number of the zoospores usually produced on germination in *Œdogonium*; the details may differ, but in the zygotes of *Closterium* and *Cosmarium*, and in the formation of the auxospores of *Rhopalodia*, Klebahn has demonstrated this division into four; also Chmielewsky has described a similar production of four nuclei in the germinating zygotes of *Spirogyria.* When it is further stated that in some of these cases there is good reason to think that a reduction of chromosomes is connected with the division into four, just as a reduction is now known to accompany the tetrad division in Archegoniate and Phanerogamic plants, it is plain that such cases as that of *Œdogonium* ought not to be assumed to support a homologous view without any fresh observation of the facts.

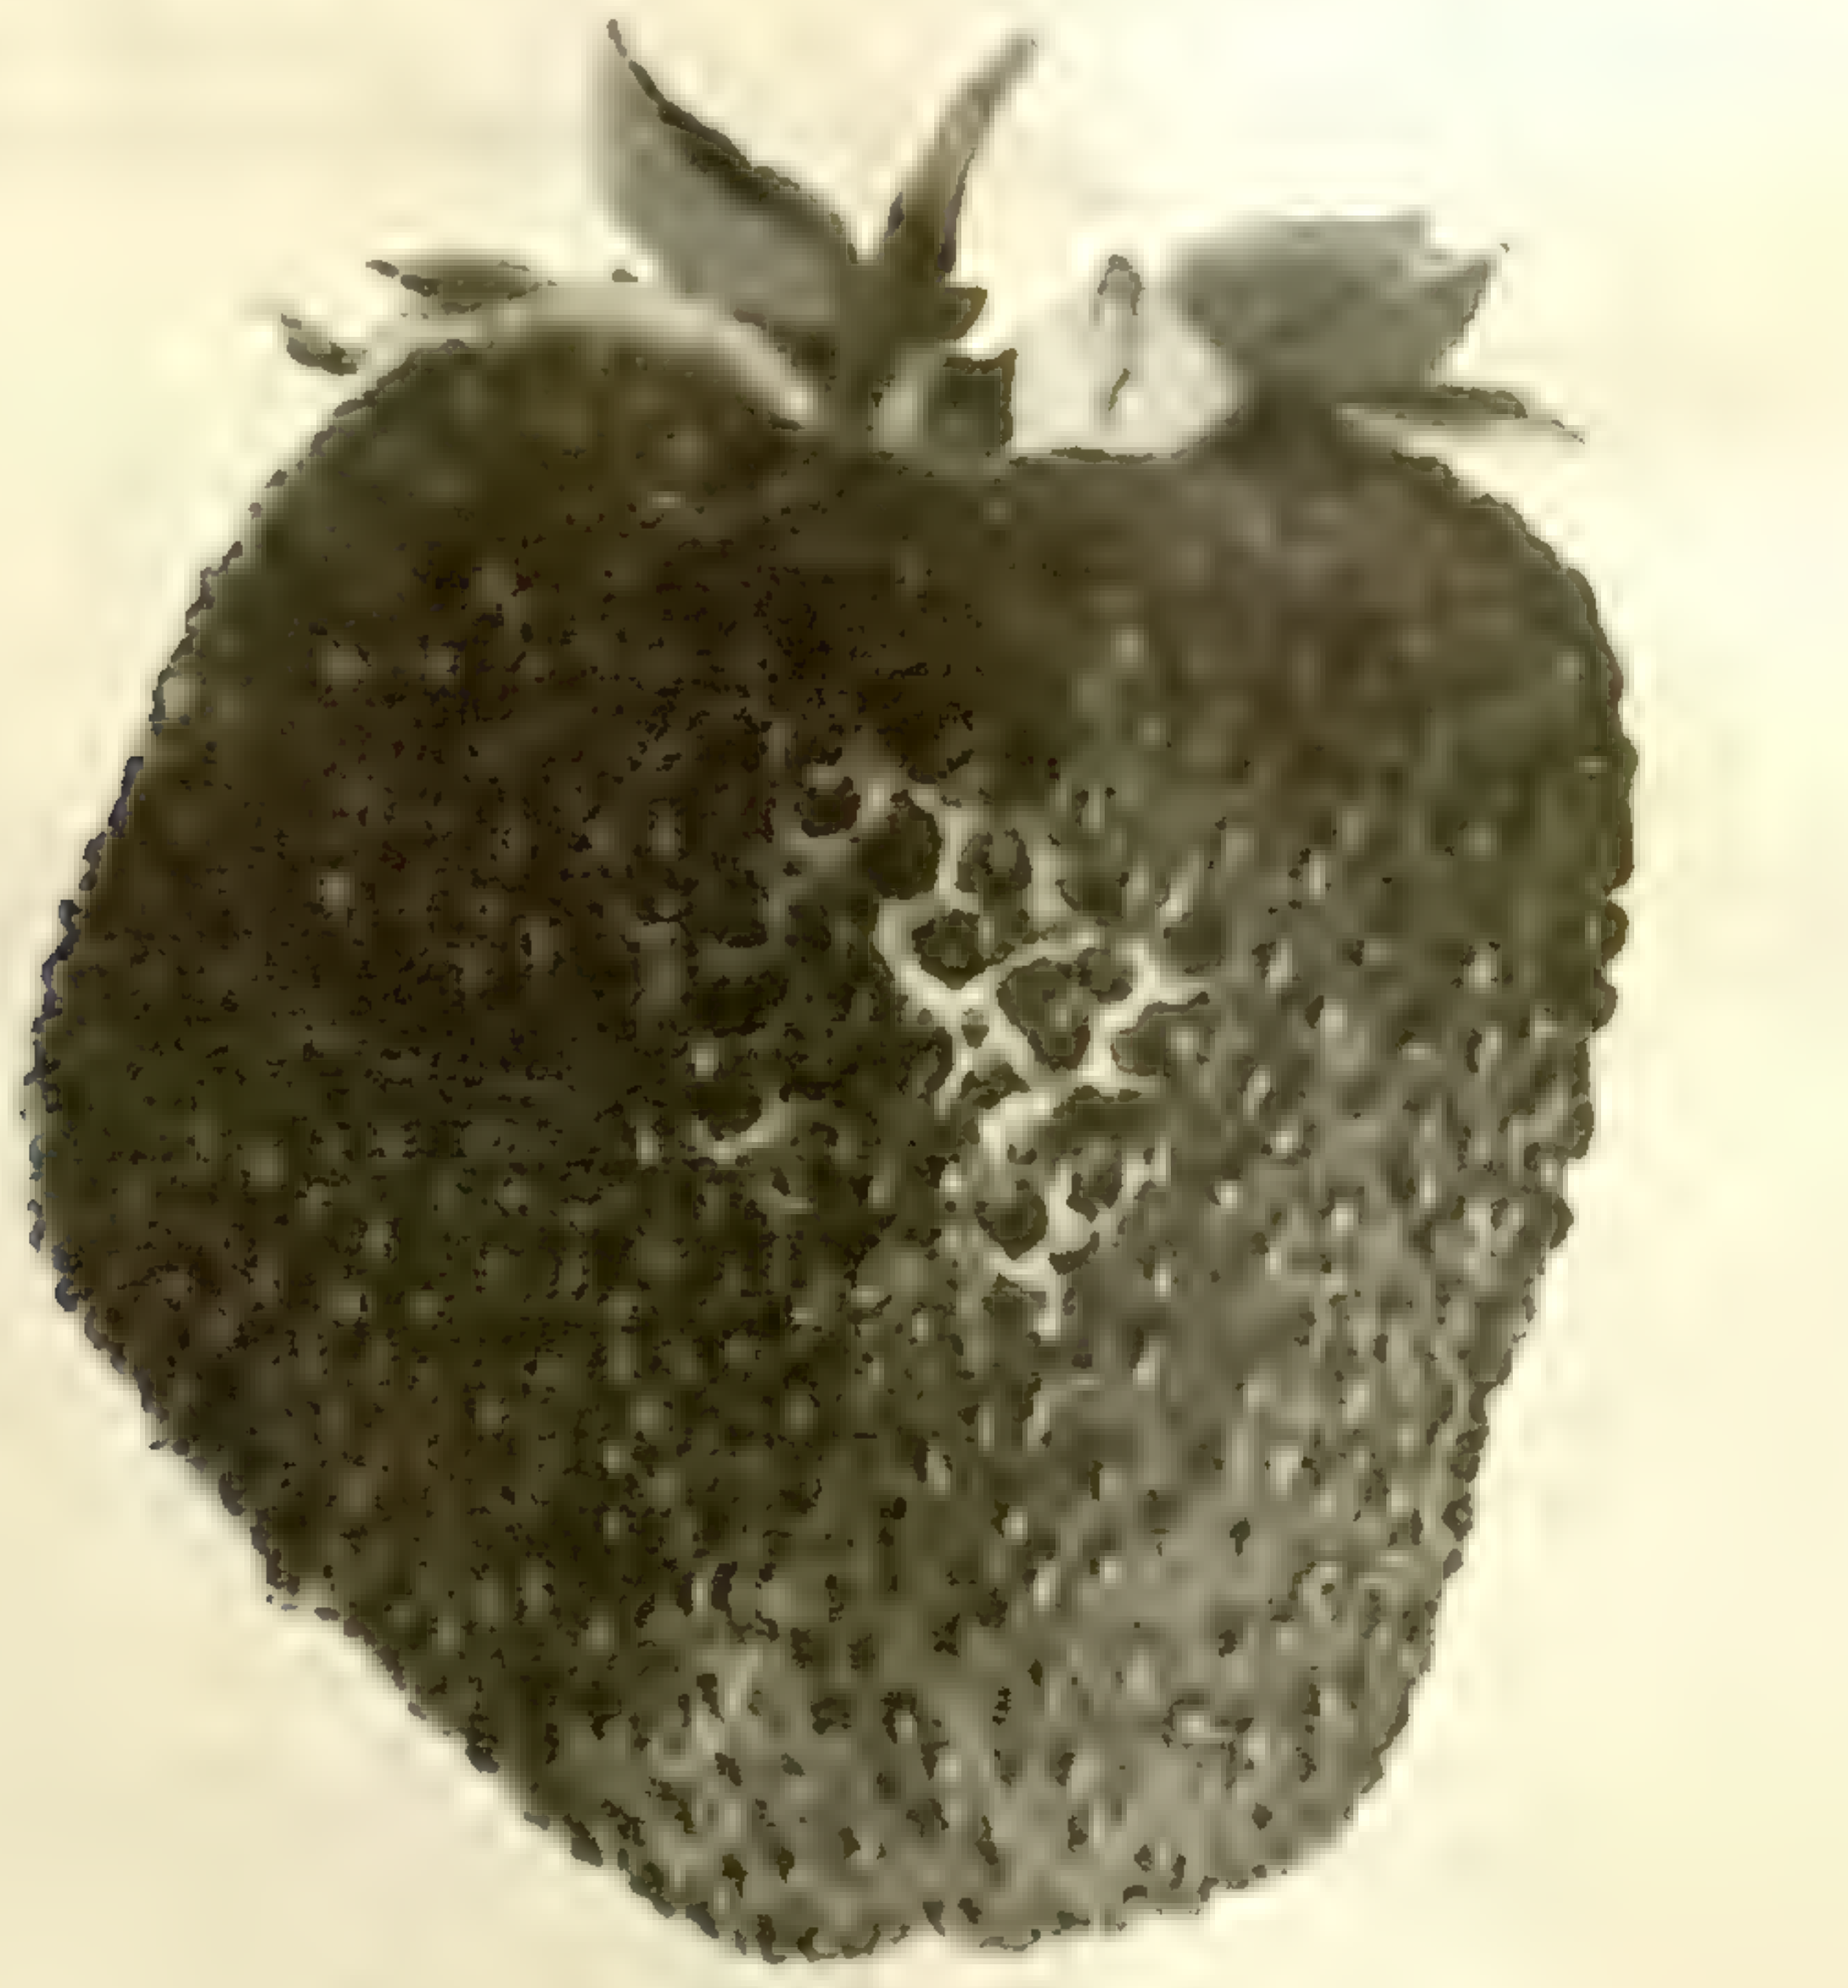
With the whole question of alternation, the nuclear details and differences in number of the chromosomes on division are now intimately bound up. Though the observations are still few, so far as they go they are consistent with the generalization first stated by Overton, and elaborated by Strasburger as regards the Archegoniate and Phanerogamic plants. It has now been seen in cases drawn from various groups, that the cells of the gametophyte show a certain number (*n*) of chromosomes, while those of the sporophyte show on nuclear division double that number (2*n*) of chromosomes. Since Section K has had the advantage of a statement on this subject from Professor Strasburger himself at Oxford, and as Dr. Scott also discussed the matter at Liverpool, I need not enlarge. I shall only remind you that Strasburger took up the position that the number of chromosomes which appears in each sexual nucleus is that original number which the ancestors possessed in a pre-sexual period; while the reduction of the double number which results from sexual fusion is, in his opinion, to be regarded as an atavistic process.

It is now well known, however, from the observations of Farmer and of Strasburger, that the nuclear conditions of *Fucus* are peculiar; that the reduction only takes place on the formation of the sexual organs themselves, and that the *Fucus* plant, like a sporophyte in the Archegoniate series, has the double number of chromosomes. At first sight this might appear to be a fatal difficulty, and Dr. Scott, attributing to the adherents of the antithetic theory views from which I personally dissent, has landed them in a seeming *reductio ad aburdum.* He himself does "not think we are as yet in a position to draw any morphological conclusions from these minute differences, interesting as they are." But we need not accept either of these extreme positions, if only a certain elasticity of theory be maintained, which should come naturally to adherents of polyphyletic development. I think the difficulty will chiefly be felt by those who, like some of the earlier writers on alternation, attempt to reduce all plants which show sexuality in to one stiff scheme; this has been found to fail in the case of alternation, and a healthy recognition of various types of alternation has been the consequence. So in the matter of chromosomes and of the position which the event of reduction holds in the life cycle; difficulties such as this in *Fucus* may be anticipated, if we assume that all plants will conform to one plan. But Strasburger has not considered it necessary to cast aside the nuclear details as a basis for morphological conclusions, because all plants investigated do not fall in with a preconceived scheme. On grounds of comparison of behaviour of the nuclei before and after conjugation in *Closterium*, *Cosmarium*, *Spirogyra*, in certain Diatoms, and finally in *Actinophrys*, he has arrived at the conclusion "that a shifting (Verschiebung) of the time of division into four, together with reduction, is possible in the history of development of organisms." It will doubtless be necessary later to put a precise meaning upon the word "Verschiebung," and to define how far, in given cases, it is to be understood as an actual shifting of the event within one line of descent, how far it merely expresses an initial difference maintained, or, it may be, extended, in different lines.

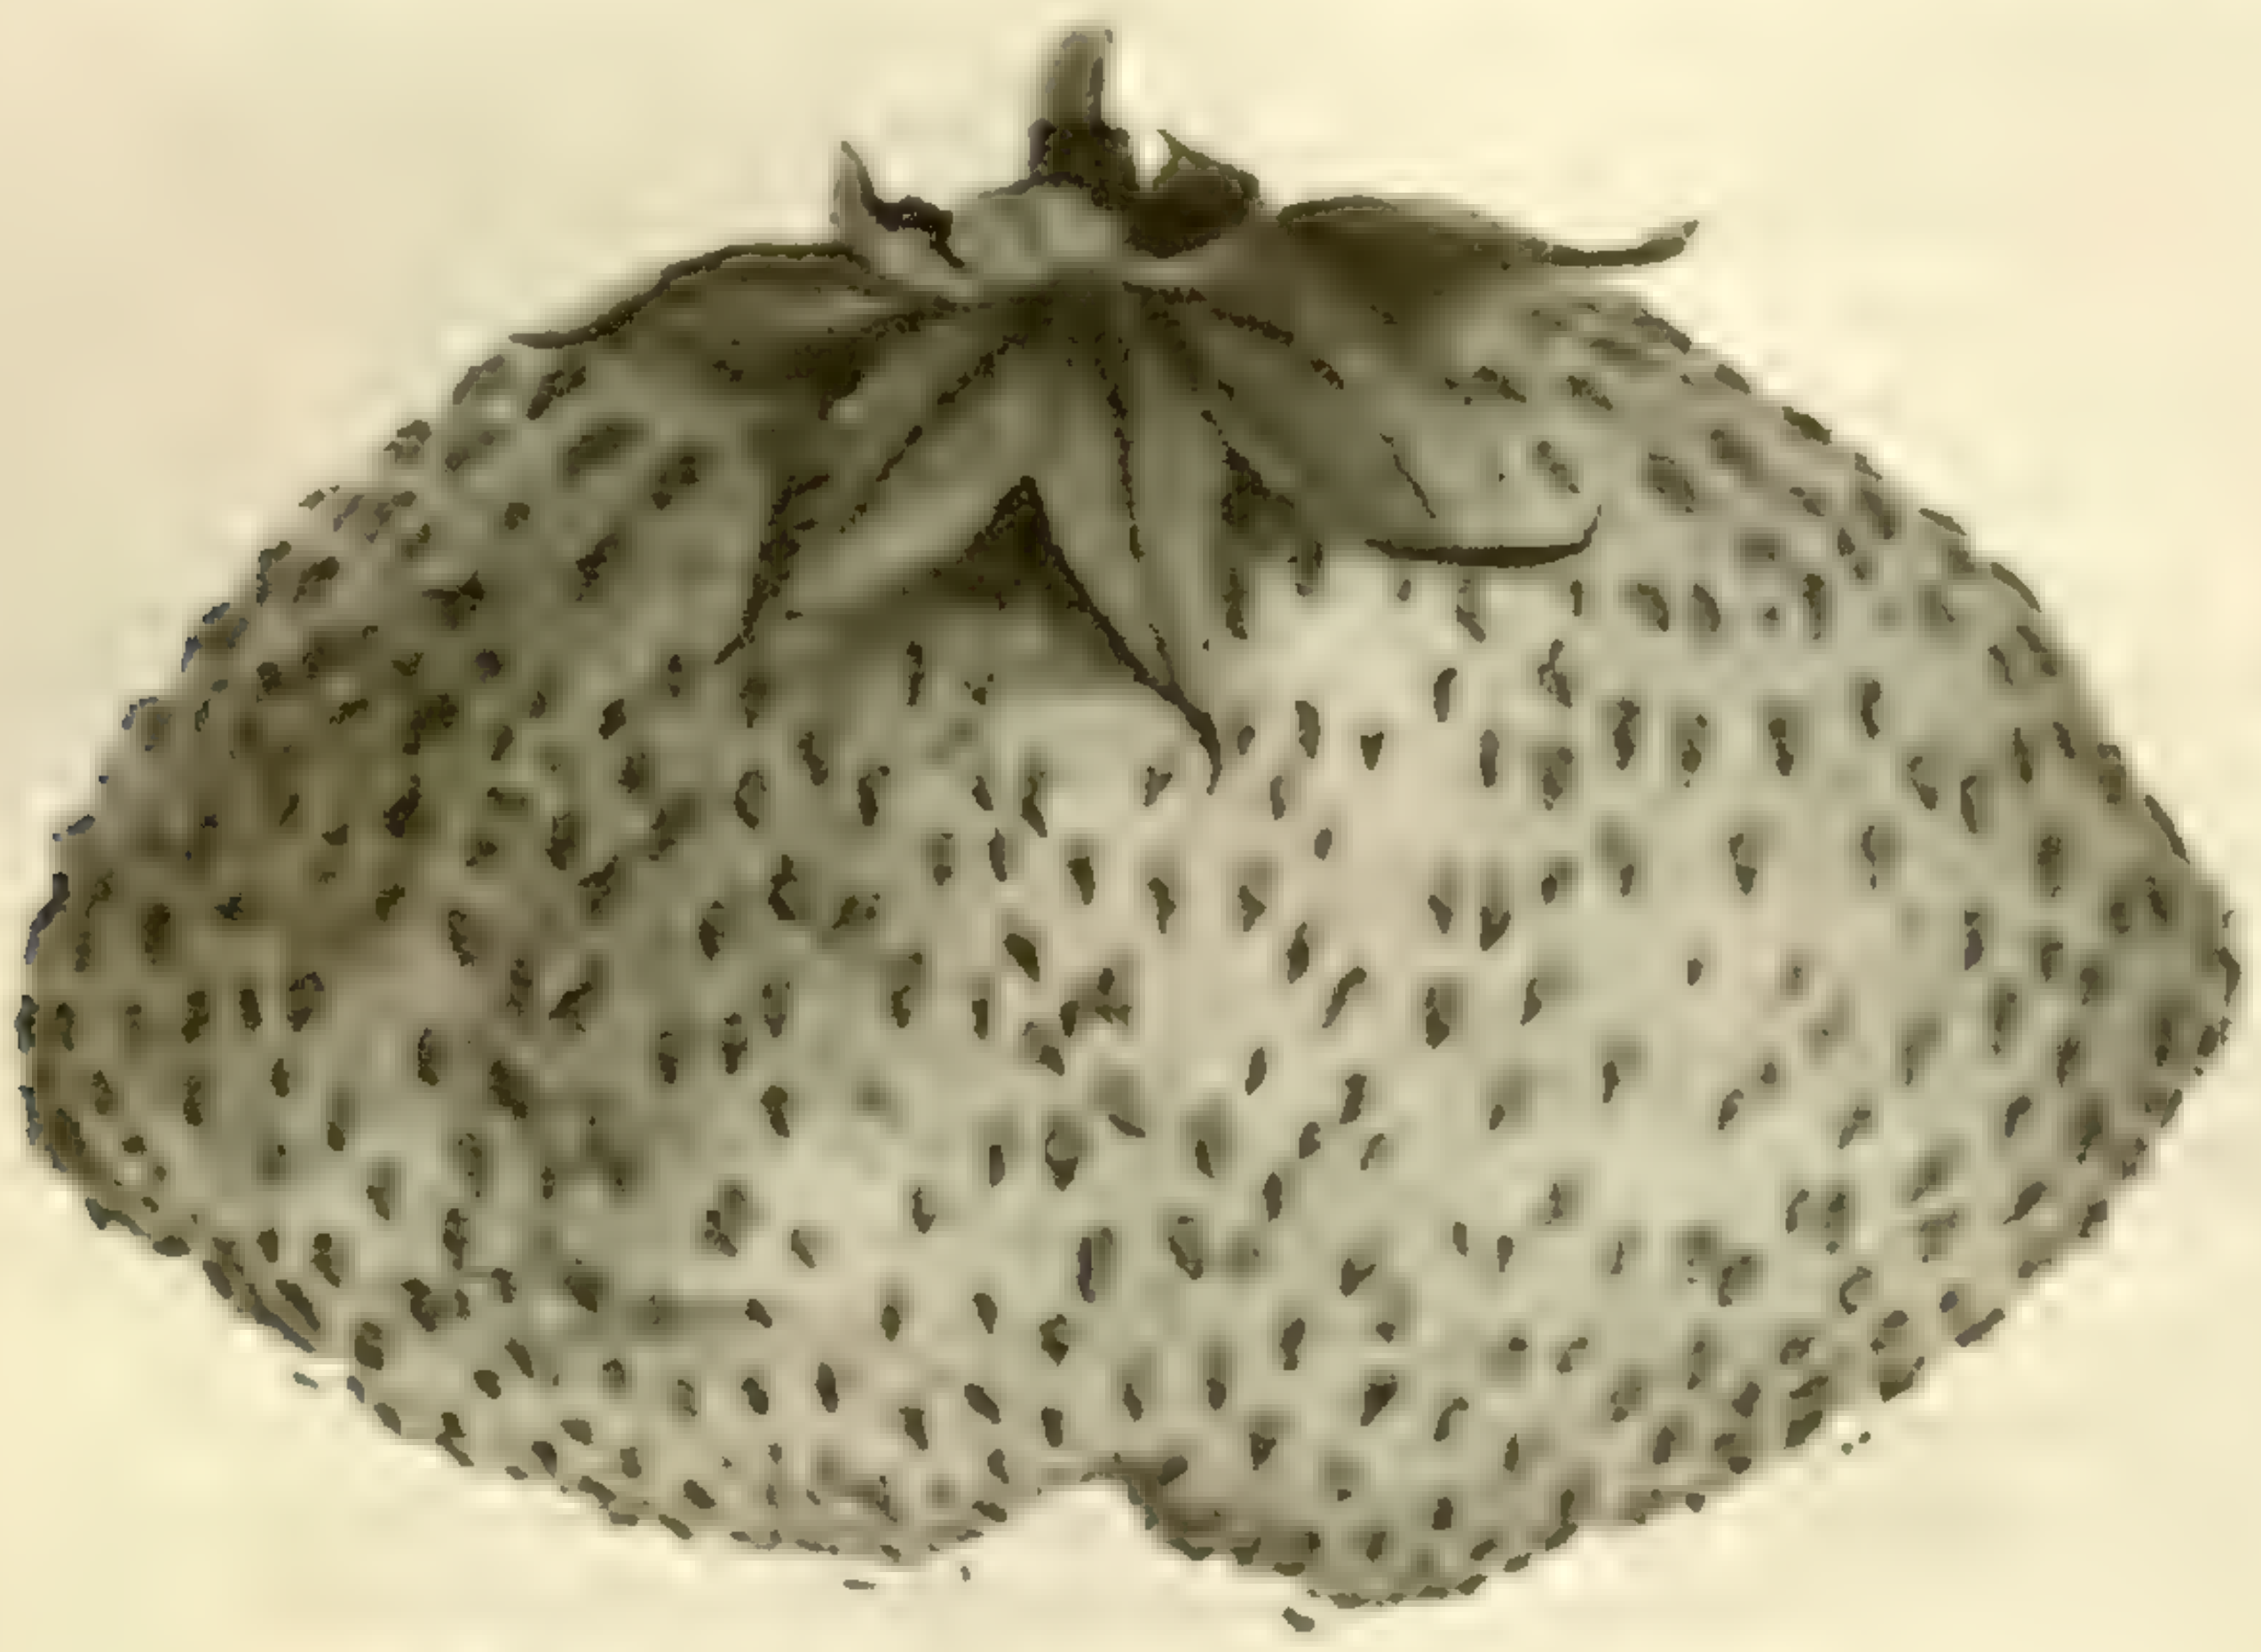
(To be continued.)

TWO NEW STRAWBERRIES.

THE two new strawberries placed before the public this year by Messrs. J. Veitch and Sons, Chelsea, possess in a marked degree the two essential qualities of a strawberry, viz., richness of flavour and good cropping powers. With regard to flavour alone, there is no doubt that the dark crimson variety, named Exquisite, takes pre-eminence, for in richness it even surpasses British Queen, a variety that has always been set up as the highest standard of excellence in this respect. It has somewhat conical, wedge-shaped fruits of a very dark colour, while the flesh is also very dark, indicating the probable use of Waterloo as a pollen parent, Lord Suffield being the seed parent. In the matter of cropping it is not behind many popular sorts; but it is on the score of delicious and rich flavour, and its usefulness purely as a dessert fruit at home, that it is to be recommended. The second variety differs from the former both in shape and colour, as a glance at the illustrations will prove. This is Veitch's Prolific, a most profuse cropper, bearing fair-sized scarlet fruits, that are wedge-shaped, but inclining to the cockscomb formation. These fruits are highly flavoured, luscious, and white fleshed, firm and solid. The variety is one of the most prolific we have seen, and, as such, will recommend itself to those who have to provide quantities of good strawberries. Veitch's Prolific is the result of crossing Empress of India with British Queen, and it was awarded a first-class certificate by the R.H.S. on July 12 last.



Strawberry Exquisite.



Strawberry Veitch's Prolific.

Spring-flowering Bulbs.—The bulb catalogues are now arriving, and no time should be lost in ordering those that are to be bought for autumn planting. If masses of colour be desired, beds may be filled with one kind of hyacinth, tulip, or daffodil, as the case may be, examples of which are prominent in spring in the London Parks. Where, however, a more continuous display is aimed at, bulbs may be associated with a groundwork of other subjects, as pansies, violas, myosotis, and similar plants; and planted thinly among them, the latter will carry on the display after the bulb flowers are past until the summer bedding out. Among blue hyacinths Charles Dickens, Grand Maitre, Lord Derby, Czar Peter, Orondates, and General Havelock are good single bedders; of white, Mont Blanc, Madame Van der Hoop, Mina, Grandeur a Merveille, and La Grandesse; shades of red, Norma, Lord Macaulay, Robt. Steiger, General Pelissier, Von Schiller, and Gigantea. Of showy double tulips the following are good: Yellow Tournesol, bright golden-yellow; Gloria Solis, large reddish-brown with golden edge; Murillo, pale rose; Purple Crown, purplish-crimson; La Candeur, white. Of single-bedding tulips the following are good: Canary Bird, early yellow: Yellow Prince, bright yellow; Joost Van Vondel, crimson; Prosperine, fine dark rose; Duchesse de Parma, red and yellow; Belle Alliance, dwarf early scarlet; Couronne Pourpre, dark crimson; Comte de Mirabeau, white; La Reine, rose and white; Prince of Austria, late orange-red; Keizer Kroon, crimson-scarlet with yellow margin; and Vermillion Brilliant scarlet Daffodils, Sir Watkin, Emperor, Empress, Princeps, Golden Spur, and Single Incomparabilis are also useful for massing in beds or associating with other subjects.—C. Herrin, *Dropmore Gardens, Maidenhead.*

FIBROUS-ROOTED BEGONIAS.

THE introduction of the fibrous rooted section of begonias as subjects for the embellishment of the flower garden was indeed a boon to those who are compelled to keep the beds gay over a long season, whether the weather is favourable or not. Certainly in the driest of gardens the fibrous-rooted begonias have presented a wealth of blossom when other subjects were all but exhausted by the extreme heat and drought of the last two months. When we consider, too, how easily from seed a large stock of plants can be raised that will give entire satisfaction the first season, an additional gain has to be recorded. In fact, the plants simply require treating as half-hardy annuals, and this is simplicity itself. At present there are half-a-dozen or more varieties, all emanating from B. semperflorens. The colour ranges from deep crimson to white, the growth is all that could be desired, being sturdy, yet compact, while the continuity of the flowering period is one of the characteristics of the race. To the Messrs. Sutton, I believe, we are indebted for several of the best varieties. Fairy Queen may safely be classed as the gem of the section, and there is a grace in the semi-drooping, branching stems, combined with the intense freedom of flower production of this form, that is not equalled by any other. The colour is a bright rosy carmine, most telling in a mass. In height it grows from ten to fifteen inches.

Crimson Gem is distinctly a gain to the flower garden. Not only are the rich red blossoms so telling in a mass, but the crimson-bronze colour of the leaves enhances its appearance considerably, rendering it doubly an object of interest; it grows from ten to eighteen inches high. Duchess of York is an elegant growing, carmine flowered variety, and the green foliage forms an admirable setting to the delicately tinted blossoms. Duchess of Edinburgh has white flowers suffused with pink, which grow much larger than those of the typical B. semperflorens. Miniature Bedding forms quite a new departure in begonias, as in habit of growth it much resembles a well-grown lobelia, and as an edging to beds it should prove a great acquisition. In height it grows at the most six inches, is floriferous, and the bright red flowers harmonise with many subjects. Its foliage, too, is suffused with purple. Princess Beatrice is still one of the most useful of this section; the pale pink blossoms are most freely produced, and the expanding buds are white, which enhances its appearance and gives variety. Not only in a mass by itself is this variety imposing in the garden, but as a carpet for tall-growing subjects like Lobelia cardinalis, for instance, or even purple fuchsias, it is valuable. Coral Gem is an exceedingly free-flowering, compact-growing variety. As its name implies, the colour of its blossoms is coral, and a pleasing tint it is. Snowflake, as its name suggests, has pure white flowers, which are produced in abundance on stout stems. All of the above mentioned varieties, with the exception of the latter, are easily produced from seed, the bulk of them coming wonderfully true to name.

In raising a stock of Princess Beatrice it is best to divide the tufts, as every particle with a root attached will grow into a sturdy plant if given suitable treatment, viz., cool conditions in the spring, with just sufficient warmth to incite a free growth during the month of March, when dividing is best done. By cuttings is not a fruitful source of increasing the stock, as although they strike readily, the plants afterwards do not throw up sucker-like growths, and instead of being of a shrubby character they are merely straight stems. To obtain a stock of the other varieties, sow seed in pans of sandy soil the first week in February in a warm, moist atmosphere. By carefully shading from bright sun, and maintaining moisture in the soil, the seed quickly germinates. Directly the plants are large enough to handle, they should be pricked off into other pans of sandy soil and given a place near the glass to induce a stocky growth, gradually innuring them to cooler quarters as growth proceeds. It is in this last detail that so many persons fail in having a good outdoor display of not only fibrous but tuberous begonias. Too often we see them growing in heat much too strong, in the hope of inducing the plants to grow large, so that they will at once give a wealth of bloom when put out in the beds. The soft, sappy growth resulting from this treatment renders them unfit to withstand either cold wind or hot sun.

E. Molyneux.

HIBISCUS MANIHOT.

As an interesting and easily grown plant for greenhouse or conservatory decoration at the close of summer, few can surpass this beautiful Hibiscus. It is not a new plant, though last year an award of merit was granted by the Royal Horticultural Society to specimens shown at a meeting in September. The date of introduction from the East Indies is given by Paxton as 1712, hence it seems curious that the plant's merits have been so long overlooked. Seeds were distributed last spring, and as the result of sowing in warmth during February, we have had plants flowering since the last week of August. The specimens attain a height from two to three feet, and are very free-flowering; the largest blooms measure six inches in diameter. Though flowers only last one day, each morning new ones open, thus keeping up a continuous display, which is likely to continue for some weeks longer yet. The colour of the perfect blossoms is a lovely soft yellow, with a rich maroon blotch at the base of the petals, and as the flowers fade they take on a pink tinge. Our plants have been grown in ordinary potting soil, such as would be used for pelargoniums, and since they were well established in small pots have been growing in a cool house. The foliage is handsome, and the plant of shapely growth. It is much appreciated here, and may be grown by anyone possessing a greenhouse who cares for plants of this character for late summer and autumn blooming.

We have tried several specimens outside in the flower borders, but this year they have not been a success; perhaps the cool weather of June and July prevented them making a proper start. An excellent illustration of Hibiscus Manihot was given in the issue of the Gardeners' Magazine for September 18, 1897, p. 583, together with historical notes.

Trent Park Gardens. W. H. Lees.

THE APPLE CROP.

Anglesea.—Apples are a full crop. Bismarck, Blenheim Orange, Cox's Pomona, Cornish Gilliflower, Duchess of Oldenburg, Ecklinville Seedling, Gladstone, Grenadier, Bramley's Seedling, Hawthornden (new), Lady Henniker, Lady Sudeley, Lord Grosvenor, Lord Suffield, Moston's Seedling, Betty Geeson, King of Pippins, Cellini, Cox's Orange, Lemon Pippin, Prince Albert, Queen Caroline, The Sandringham, Small's Admirable, Rose of Sharon, and Ringer are those varieties which carry full crops, but the following have no fruit at all: Alfriston, Astrachan, Devonshire Quarrenden, Mère de Ménage, Peasgood's Nonsuch, and Ribston Pippin.—W. HUNTER, *Baron Hill Gardens, Beaumaris.*

Cardiganshire.—Apples are below the average this year in this district, although a few good samples are to be met with. Codlins, which were so plentiful last year, are almost a failure this. The varieties that have done the best this year are Warner's King, Lord Derby, Alfriston, Dumelow's Seedling, Blenheim Pippin, Worcester Pearmain, King of the Pippins, Cox's Orange Pippin, Irish Peach, New Hawthornden, Mère de Ménage, Royal Russet, and American Mother. These have all an average crop, very clean, and with the fine weather we are now having promise to colour up well. That fine cooking apple, Lord Suffield, which as a rule, is one of the very best in this district, is very scarce this time.—R. E. WILLIAMS, *Crosswood Park Gardens, Aberystwith.*

County Down.—Apples are in some instances a good crop. A number of the larger cooking varieties such as Warner's King, Ecklinville, Bramley's Seedling, Peasgood's Nonsuch, The Queen, Blenheim Pippin, Lane's Prince Albert, Loddington or Stones, Cox's Pomona, Hawthornden, &c., are up to the standard, except, perhaps, a trifle smaller than previous years, while none of the higher dessert varieties carry anything like a crop, and the fruit is very small. Cox's Orange, Ribston Pippin, Worcester Pearmain, Irish Peach, Kerry Pippin, and all the late russets are a very poor crop indeed, and along with the codlins they seem to have suffered terribly from blight, which in some cases has quite stripped the trees of all foliage; fortunately it has confined itself mostly to old trees and those on walls or trellises.—THOMAS BRADSHAW, *Hillsborough Castle.*

—— Apples are a very poor crop here, except on trees of Red Hollandbury, which are very heavily laden; Northern Greening, Pott's Seedling, Norfolk Beefing, Royal Russet, London Pippin, and a few local varieties are fairly well laden. There was a grand show of bloom on nearly all the trees. I have seldom seen a better promise of a crop, but it was soon dispelled, as most of the standard and old-bush trees lost most of their foliage early in June through blight. Red spider is very plentiful on some trees. The soil is poor and gravelly, and water was very scarce this summer in these gardens.—J. LEICESTER, *Seaforde Gardens, Clough.*

Dublin.—The apple crop here is considerably above the average, and of good quality; indeed, the best we have had for some years. The following are some of best cropping sorts this season: Blenheim Pippin, Kerry Pippin, Emperor Alexander, Lord Suffield, Warner's King, Ecklinville Seedling, Golden Spire, Irish Peach, Red Juneating, Hawthornden, Betty Geeson, and Dumelow's Seedling.—G. SMITH, *Vice-Regal Gardens, Phœnix Park.*

Dumfries.—All the apples here are on walls and espaliers; the varieties grown are the following: Duchess of Oldenburgh, Lord Suffield, Pott's Seedling, Cellini, Ecklinville Seedling, Bismarck, Lord Grosvenor, Hawthornden (new and old), Stirling Castle, Peasgood's Nonesuch, Golden Noble, Warner's King, Tower of Glamis, Bramley's Seedling, Beauty of Kent, Lane's Prince Albert, Oslin Pippin, Cox's Orange Pippin, Gascoigne's Scarlet, Ribston, Barton Freebearer, and Scarlet Leadington. All of them with a good degree of success, but the best, and most suitable too, for this garden, are Ecklinville, Warner's King, Oldenburgh, Peasgood, and Barton Freebearer. Espalier trees on crab; wall trees on paradise, Lord Suffield, and Lord Grosvenor bear well, but canker bad and look unhealthy.—J. URQUHART, *Hoddom Castle Gardens.*

Durham.—The following apples have done well with us this year: Ribston Pippin, Golden Pippin, Red Quarrenden, Potts' Seedling, Stirling Castle, Stone Apple, Nelson's Glory, Northumberland Fillbasket, Queen Caroline, Lane's Prince Albert, Lord Derby, The Queen, Frogmore Prolific, Golden Reinette, Ecklinville Seedling, Keswick Codlin, Blenheim Pippin, Northern Greening, Wormsley Pippin, Bismarck, Dumelow's Seedling, Golden Spire, King Harry, Lord Suffield, Bramley's Seedling, Schoolmaster, Ringer, Herefordshire Beefing, Sandringham, Grenadier, Red Astrachan, Beauty of Bath, and Duchess of Oldenburg.—J. TULLETT, *Raby Castle Gardens.*

East Lothian.—The most productive varieties of apples in this district I find —Warner's King, Lane's Prince Albert, Pott's Seedling, Stirling Castle, King of the Pippins, and Duchess of Oldenburg. The codlin type are all under the [illegible] and mostly a very poor crop.—GEORGE TAYLOR, *Broxmouth Park.*

Essex.—The crop of apples in this district is under average. In the early season there was a great display of blossom, and, after setting the fruit, the trees became greatly infested with blight, causing almost some trees to become leafless. The varieties that are the most fruitful, but must quote mostly all fruits undersized, are as follows: Adams' Pearmain, Alfriston, Blenheim Pippin, Beauty of [illegible], Bramley's Seedling, Cox's Pomona, Duchess of Oldenburg, Dumelow's [illegible], Ecklinville Seedling, Fearn's Pippin, Golden Spire, Golden Noble, [illegible] Pearmain, Hawthornden, Hollandbury, Irish Peach, Kerry Pippin, King [illegible] Pippins, Lady Henniker, Lady Sudeley, Lane's Prince Albert, Lord Derby, [illegible] Grosvenor, Lord Suffield, Northern Spy, Reinette du Canada, Ribston Pippin, Striped Beefing, Warner's King, Wadhurst Pippin, and Worcester Pearmain.—A. KEMBER, *Gosfield Hall.*

Forfarshire.—Apples are only a casual crop this year. Some young trees of Lord Grosvenor, Duchess of Oldenburg, and Keswick Codlin are carrying very good crops of fine fruits, while varieties such as Ecklinville Seedling, Northern Dumpling, and Beauty of Moray, usually so fine with us, are this season a [illegible] failure. The above named varieties, along with Worcester Pearmain, King of the Pippins, Beauty of Kent, and Tower of Glamis are our best cropping [illegible] here.—T. WILSON, *Glamis Castle Gardens.*

Glamorganshire.—The crop is the largest we have had here for some [illegible] the fruits are much smaller than usual. The trees bloomed profusely, [illegible] of the flowers set, but owing to the long-continued drought a great many [illegible] when small; and some of the varieties are grub-eaten, and these [illegible] to drop when fully grown. It would be difficult for me to say [illegible] were the most productive varieties this season. All the varieties in the [illegible] here were so heavily laden that the branches had to be supported to keep [illegible] breaking under the great weight of fruit. The following varieties are [illegible] well this season: Blenheim Pippin, Warner's King, Cox's Orange Pippin, Bismarck, Wellington, Ribston Pippin, Cellini Pippin, Anna Elizabeth, Margil, and Bramley's Seedling.—A. PETTIGREW, *Cardiff Castle Gardens.*

Gloucestershire.—We have a very fair crop. The trees bloomed well, but the late spring frosts and cold winds were unfavourable to the setting of fruit. Caterpillars have not been so troublesome this season, but all fruit trees have and are now suffering very much indeed from the long spell of hot and dry weather. I have seen several apple trees lately that have lost all their leaves as the result of the drought. There is a good crop of Blenheim Pippin, but the fruit is small; Ribston, Cox's Orange, and King of the Pippins are also good; Beauty of Bath and Worcester Pearmain have carried fair crops; Lord Suffield has done pretty well, but the fruit has been rather small. I saw the other day a grand bush tree of Cox's, the fruit of good size and of splendid colour. I have no doubt that this is the best way to grow choice fruit, as trees like this one can be covered with a net.—JOHN APLIN, *Hasfield Court Gardens.*

King's County.—The apples bearing a good crop here are: Ecklinville Seedling, Domino, Warner's King, Blenheim Pippin, Ribston Pippin, Cox's O. Pippin, Greenup's Pippin, Bishop's Hero, Lady Henniker, Dumelow's Seedling, Lane's Prince Albert, Dutch Mignonne, Peasgood's Nonsuch, Hoary Morning, Cox's Pomona, Lord Derby, and one that is "locally" called Blood of the Boyne; it is a variety that I have never met with but here, and is a grand bearer every season; keeps until the spring, is of a deep blood-red colour all round, medium size, but only fit for the kitchen.—R. MCKENNA, *Charleville Gardens, Tullamore.*

Lanarkshire.—Apples are, generally speaking, below average crop. Dessert varieties are much below the average, but kitchen varieties are bearing a medium crop.—W. SUTHERLAND, *Bothwell Bank.*

Monmouth.—Although apples generally blossomed freely, the crops are not usually satisfactory, the result probably of the low state of the temperature during the flowering period. The following varieties carry the best crops upon pyramid and bush trees: Frogmore Prolific, Bismarck, Newton Wonder, Lord Derby, Grenadier, Lord Suffield, Sandringham, Golden Spire, The Queen, Wellington, Seaton House, Worcester Pearmain, Betty Geeson, and King of the Pippins. The first named is the most certain cropper that we possess, and it commences to bear heavily when the trees are very young. It is an invaluable second early variety, we have fruit of it at the present time, 15 inches in circumference, and this upon heavily cropped trees. Sandringham is another grand apple that does remarkably well here. The most shy bearers that we possess are Bramley's Seedling, Gloria Mundi, Gascoigne's Seedling, and Tyler's Kernel. The last named invariably blossoms freely, but is a bad setter. Insect pests have been troublesome, but have been kept under by spraying. The trees are very healthy and have made good growths.—T. COOMBER, *The Hendre Gardens.*

Montgomery.—Apples are a light crop and our best bearers this year are Annie Elizabeth, Potts' Seedling, Gascoyne's Scarlet, Hawthornden (winter), Bramley's Seedling, Small's Admirable, Bismarck, Lane's Prince Albert, Warner's King, Stirling Castle, Lord Derby, Cox's Pomona, Kentish Fillbasket, Beitigheimer Red, Tom Putt, Grenadier, Peasgood's Nonsuch, Beauty of Kent, Lady Henniker, Lord Grosvenor, Ecklinville Seedling, Striped Beaufin, Worcester Pearman, Mrs. Barron, Rosemary Russet, Golden Pippin, and Melon Apple.—J. LAMBERT, *Powis Castle Gardens.*

Shropshire.—Apples are under the average as regards crop, but of fine quality. Warner's King, Lord Derby, Small's Admirable, Stirling Castle, Tower of Glamis, Lord Suffield, Schoolmaster, Saltmarsh's Queen, and Gloria Mundi are all carrying splendid crops, while others are very light. On the whole they are under average, a good many are falling owing to the long spell of dry weather.—J. LOUDEN, *The Quinta Gardens, Ruabon.*

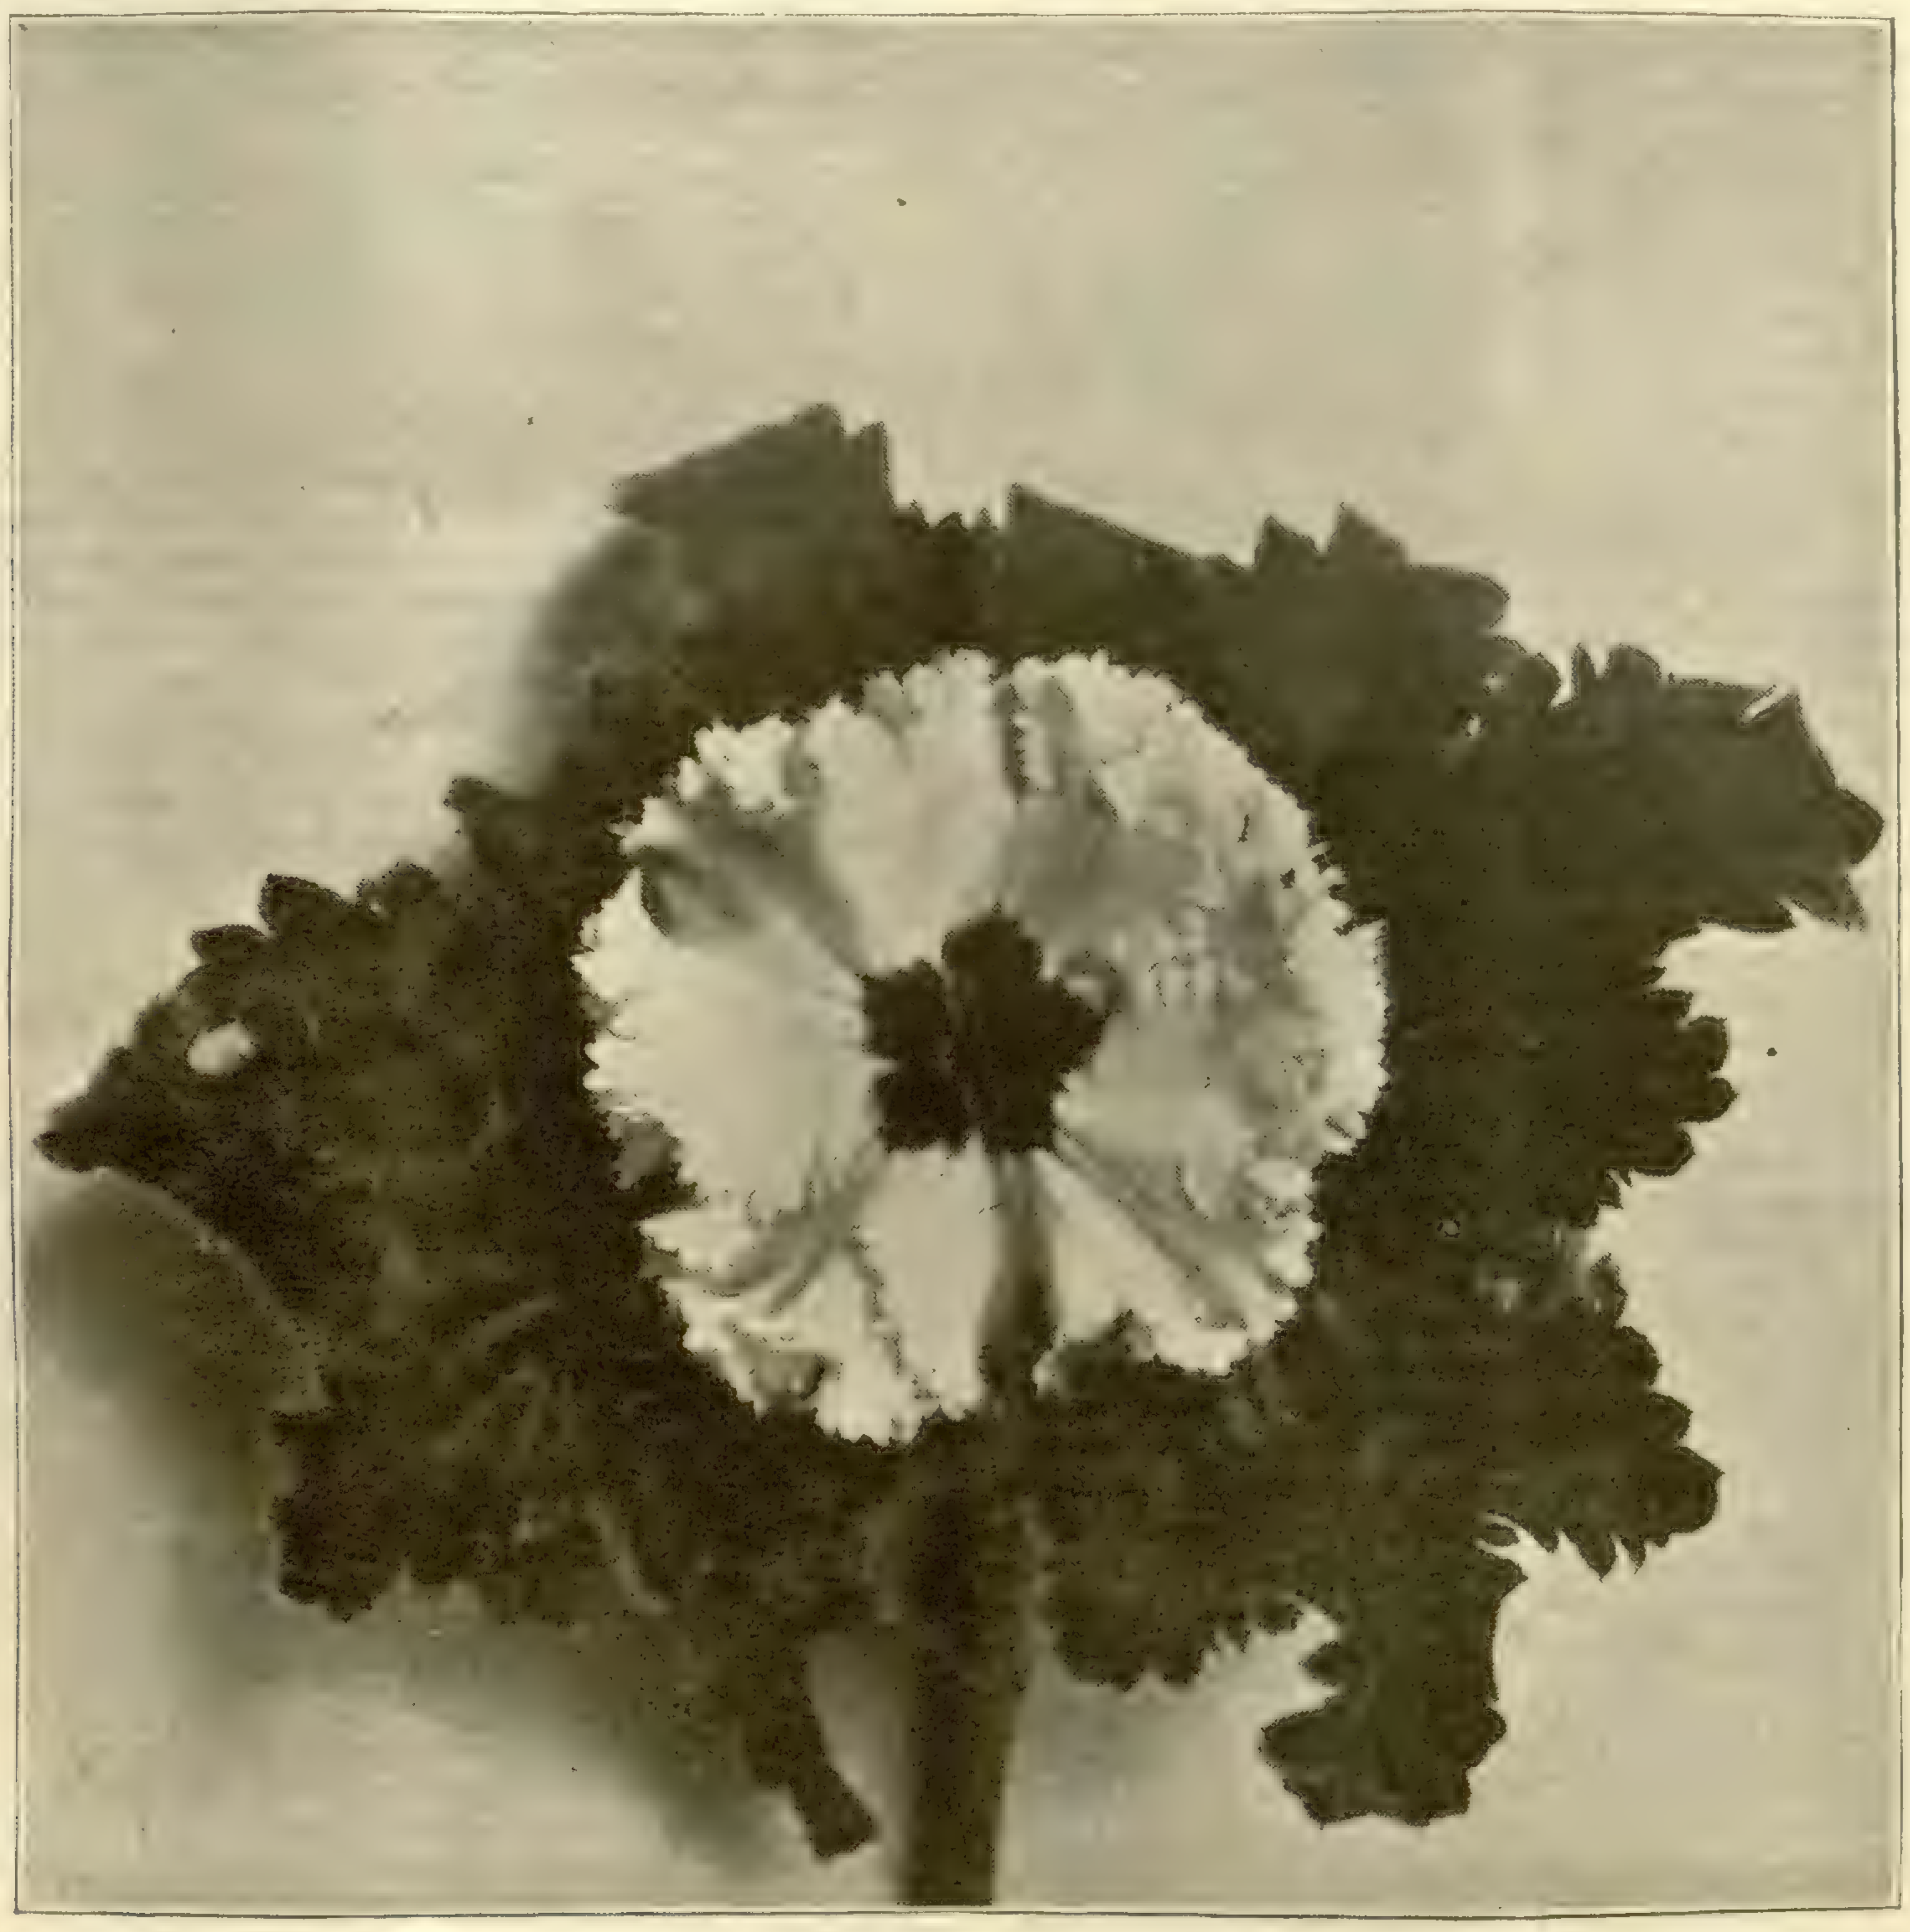
Surrey.—The following varieties have a good crop here this season: Stirling Castle, Bedfordshire Foundling, Kentish Fillbasket, Warner's King, London Pippin, Keswick Codlin, New Hawthornden, Hanwell Souring, Winter Peach, Lord Derby, Lane's Prince Albert, Sturmer Pippin, and Fearn's Pippin. Stirling Castle is the best cropper I have. I can almost rely on this for a good crop every season, and it is a good kitchen apple.—W. HIGGS, *Fetcham Park Gardens.*

Worcestershire.—Apples are a good average crop with us, the trees healthy and clean. I find that trees fruit the more freely when allowed a fairly free growth, with the main branches kept thin. Except where necessary to maintain a balanced head, the annual growth should not be shortened, as where left intact fruit buds form the whole length. The varieties which are carrying the best crops are The Queen, Tower of Glamis, Tyler's Kernel, Warner's King, Stirling Castle, Mère de Ménage, Newton Wonder (young trees), Cox's Orange Pippin, Devonshire Quarrenden, Professor, Dumelow's Seedling, Early Julien, Summer Golden Pippin, Ecklinville, Yorkshire Beauty, Lane's Prince Albert, King of the Pippins, Peasgood's Nonsuch, Worcester Pearmain, Winter Hawthornden, Potts' Seedling, Bismarck, Court Pendu Plât, Tom Putt, Rosemary Russet, Kerry Pippin, Margil, and Rymer, with a few Blenheims and Ribstons.—A. YOUNG, *Witley Court Gardens.*

Our Native Flora.—Possibly I am somewhat pessimistic in the matter, but in any case I have long held that only that which is mischievous and evil can come out of the encouragement universally given everywhere to children to gather wild flowers for presentation at flower shows as at present done. How often has the remark been made to me with a glow of exultation, "We have a wonderful show of wild flowers," and the utterers have never asked themselves what is likely to be the ultimate effect of this depletion of flowers from woods, fields, and hedgerows on our native flora. I ask any conscientous person, gardener or amateur, who has ever been at any time called upon to judge these wild flower exhibits, if they can tell me what earthly good to the children collecting and showing them has been accomplished? Have the children learned anything, are they any wiser, have they acquired any love for flowers, any knowledge concerning them or been stimulated to take any interest in them or in gardening at all? Sometimes we have seen pleasing evidence of taste in the arrangement of baskets and nosegays, but oh, how seldom; and when seen, how seldom the real work of children! In how many cases have there not been an absolutely greedy desire shown to gather and set up the very biggest bunch, literally thousands of beautiful native flowers being thus plucked from the wayside, where they adorned Nature, to be thus displayed for a few fleeting hours, then to decay and die, leaving behind no products. How often have I pleaded that instead of encouraging these wholesale massacres of wild flowers, some person in each district should form the little ones into classes, and during the summer conduct them round the lanes and woods, instructing them in the common and botanical names of each flower, then offering prizes at the local shows for collections of small bunches of twelve or twenty forms to be most correctly named. That would lead to no robbery of wild flowers, and would be really educational.—A. D.

A CURIOUS PRIMULA.

ONE of the most interesting happenings in connection with the development of their fine strains of Chinese primulas by Messrs. J. Carter and Co., of High Holborn and Perry Hill, is the production of a single variety with immense fringed flowers of the purest white, but with an enormously developed leafy calyx, instead of the usual regular organ surrounding the tube of the corolla. The variety originated a year or two ago, and has already been fixed, but owing to the small amount of seed produced it has not hitherto been catalogued for distribution. Bouquet is the name most suitably given to this primula, for each flower has its own elegant setting of greenery, as the illustration shows, while the whole central truss of flowers is also furnished with a circle of leafy bracts, quite in addition to the usual radical foliage. The large flowers are heavily and beautifully frilled, and the foliaceous calyx is also waved, crimped, and frilled in a remarkable and elegant fashion. Besides being a curious and interesting variety, as showing what strange freaks and breaks are sometimes made, as a sort of protest, by a flower that the florists wish to develop in a certain direction, Bouquet is also handsome, even when not in flower, by reason of the frilling of its leaf lobes, and calyces.



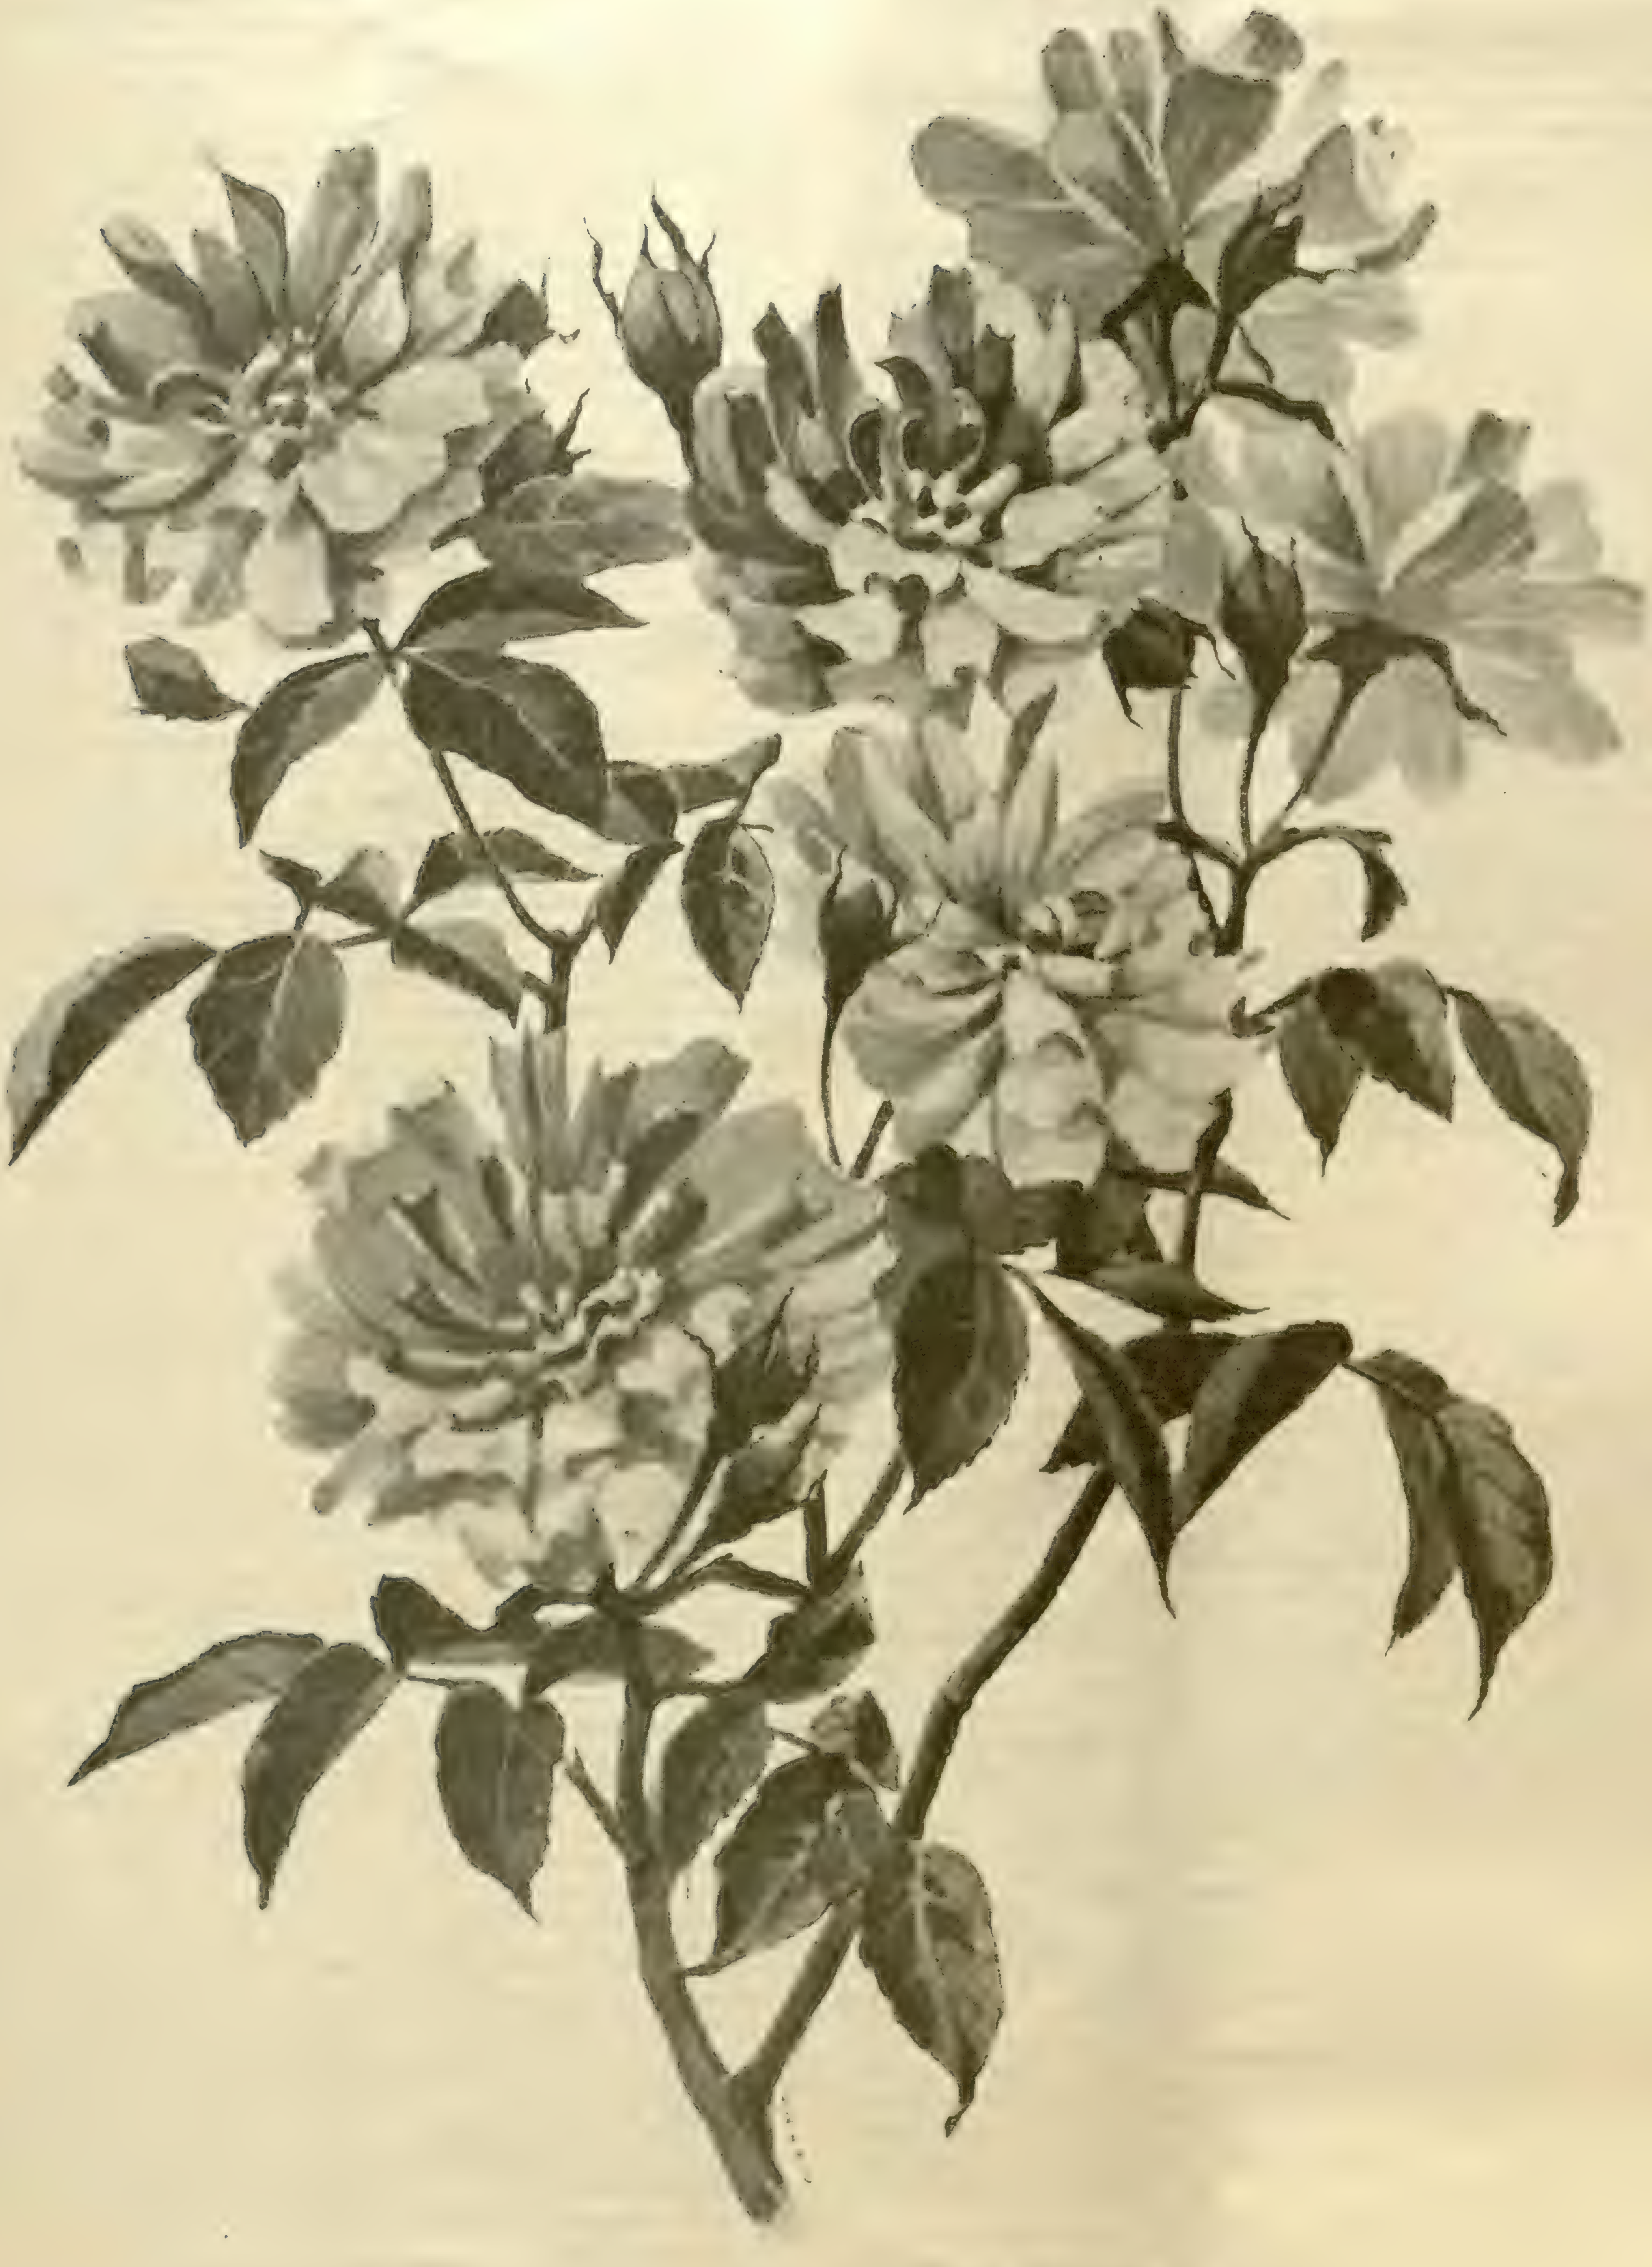
A CURIOUS CHINESE PRIMULA, BOUQUET.

Dessert Tomatos.—Market growers would look askance at the recently certificated Currant Tomato no doubt because the fruits are so small, yet there may be persons who would gladly purchase clusters of such a variety for dessert purposes, because these may not only be readily mistaken for bunches of the Red Cherry currant, but the fruits are very nice indeed for dessert purposes, and are, so far as flavour is concerned, much in advance of the large fruits for that purpose. Growers keep on adding to the list of names of so-called varieties without greatly adding to actual merit or distinctness. It seems impossible for anyone, however ready to create names, to produce varieties amongst the large fruiters that are superior in cropping, in colour, beauty, and solidity of fruits than many so-called varieties already in commerce. The creation of tomatos for market sale alone seems to be the dominant idea with most growers. Would that some one would put those aside altogether as no longer needing manipulation and would take in hand this Red Currant variety, the delicious Red Cherry, the beautiful yellow Golden Nugget, and the Red Dessert, as the very best of their class, and by seeking to intermingle the best qualities of all, secure for us, if it be practicable, superior flavour to that which even the best tomatos now furnish. Some two or three years ago when there was a large trial of tomatos at Chiswick not a variety could equal in flavour the fruits of the Red Cherry. Next to this came the beautiful yellow Golden Nugget. For dessert purposes we want none larger than are fruits of the latter, and none smaller than are those of the Red Currant, the fruits of which are very pleasant eating when cool and just ripe.—A. D.

POLYANTHA ROSE, PERLE DES ROUGES.

THE merits of the now numerous varieties of polyantha roses have been often brought before the public during the past few years, especially since the great increase in the demand for hardy flowering shrubs. The advent of the beautiful Crimson Rambler also assisted largely in drawing general attention to a hitherto somewhat despised section of garden roses, and it soon became known that dwarf varieties eminently suitable for bedding were to be obtained, and would prove as useful and beautiful as the rampant climbing or rambling forms. It is not necessary here to enter into a long dissertation upon the merits and uses of polyantha roses, for the section has been dealt with by leading rosarians in our columns, especially in the Special Rose Numbers of the GARDENERS' MAGAZINE, published each succeeding year in July. We take the present opportunity of presenting our readers with an illustration of a new and distinct polyantha rose, named Perle des Rouges, a variety raised on the Continent and introduced by Messrs. Wm. Paul and Son Waltham Cross, who submitted a handsome basket of flowering sprays for the inspection of the Royal Horticultural Society's Floral Committee on July 12 last, when an award of merit was granted. It is a rose of dwarf and bushy habit, and the flowers are described by the Waltham Cross firm as "deep velvety crimson, small and double, produced in clusters; the deepest and richest in colour of the dwarf polyantha roses, blooming abundantly and until late in the season." Our own description, published when the award was made, is "a beautiful polyantha rose, exceedingly free-flowering, and producing much-branched clusters of rich crimson flowers, the bases of the segments being shaded with deep rose."

"Histoire des Tulipes."—The above is the title of one of the prettiest little books on flowers I have ever seen. It was published in Paris, probably some time early in the present century, and the copy in my possession is tastefully bound in polished calf and richly tooled. There are twelve charming little coloured plates of different varieties of tulips, every one of which is executed in the most dainty manner, while the letterpress is of the best. Besides the history, there are chapters on cultivation, on tulip poetry, a list of the most celebrated old tulips, and also one of the best known modern varieties, in which there appear but very few English names of tulips, so that the date cannot be fixed even approximately. This flower must have pleased the French taste long before the publication of the book above mentioned, for I find in another curious old French florist's book, first printed in 1669, that Messrs. Cambier about fifty years before introduced the first tulips to Paris.—C. H. P.



POLYANTHA ROSE, PERLE DES ROUGES.

WORK FOR THE WEEK.

COOL ORCHIDS.

THE summer-like weather experienced during the last month has been very favourable to the occupants of the cool houses, although on several occasions it was impossible to keep the temperature in the house below 75 degrees during the hottest hours of the day. But, with the ventilators thrown wide open, admitting abundance of fresh air, which is always welcome to cool orchids, and the free use of the hose pipe, a humid atmosphere was easily maintained. The newly-potted odontoglossums derived great benefit from a frequent dewing overhead through the syringe; the weather having been so favourable, this has been done almost daily since potting time, and it both encourages root action and keeps the leaves and pseudo-bulbs plump. Overhead syringing must be discontinued now, however, except on very fine days, and then great care must be taken not to let any water lodge in the young growths or injury may follow. With such a high night temperature as prevails at the time of writing, air may still be freely afforded during the night, and unless cold nights should set in, no artificial heat will be necessary for some time; it should be borne in mind, however, that it is best to have a little warmth in the pipes and the ventilators open, than to close the house up without any heat at all, as a saturated atmosphere, together with a low temperature, is most injurious to cool orchids. The temperature will now, under ordinary circumstances, range between 50 to 55 degrees by night, and 58 to 60 degrees by day.

Should the masdevallias have a house devoted to them they may be kept a few degrees warmer than above, as the plants are not so liable to spot when grown a little warmer than the odontoglossums. Seldom do we see a collection of masdevallias free from black marks and spots on the leaves, and the chief cause of this is a low and uneven temperature at a time when the atmosphere is at saturation point. When the external air is warmed above forty-five degrees, the ventilators of the masdevallia-house ought always to be freely opened, and it is essential at all times that a little air be admitted to the house. Shading may now be dispensed with on all houses with a north aspect, and the blinds, after being thoroughly dried, should be removed, and stored in a dry place until wanted again next season. With more exposed houses, the blinds should be allowed to remain for a few weeks longer, as they may be required during the middle of the day, using them only if the sun be very bright, as the plants will take no harm from a little direct sunshine.

Odontoglossum Rossi, O. Cervantesi, O. aspersum, and O. Humeanum, are now growing freely, and will require a good supply of water, but care must be taken not to allow the compost to become sodden. Sophronitis grandiflora is also growing freely, and will require a good supply of moisture until the growths are complete. —E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

THE weather of late has been most trying to pot plants, especially those which have been standing in the full force of the sun, such as chrysanthemums, salvias, tea roses, epacris, and many others required for winter flowering. Not only have these needed looking over several times a day to provide the roots with water, but more copious syringings have been necessary to counteract the trying influence of the sun on the foliage. Most of the plants mentioned will have practically finished their growth, and will now be developing bloom buds; consequently, liberal supplies of water are necessary to plump them up to the largest size. Now, also, is the time that such plants require feeding; I do not advise gorging the roots with strong, rank manures of any kind, but by using weak soot water and diluted farmyard liquid alternately, better results are obtained, and less risks are run than in using too freely some of the patent manures the grower knows little about until too late, when the roots of his plants have been burnt, and his prospects of a good harvest of bloom spoilt for the season. The roots of all pot plants standing on a bed of ashes or by the side of paths, &c., will naturally strike through the drainage in search of moisture. This should be avoided by either placing a piece of slate under each pot, or twisting the latter round once a week. Most of the buds on chrysanthemums will have been selected by now for large flowers, but even where the plants are grown in the ordinary bush form, for cutting or for use in the house as pot plants, the most pleasing results are obtained by thinning the buds freely. When this is not done, especially with some varieties, the flowers are much too crowded on each spray to look pleasing either on the plant or in a cut state. Nothing is more disappointing after a season's attention to find buds being spoiled by the attacks of insects. A sharp look out must be kept for earwigs, which generally prove the most troublesome. The remedies have often been given in these pages, and only require to be followed up with zeal, to ward off attacks and save disappointment. Cleanliness is a great thing where the plants are arranged. Where litter is allowed to accumulate, the insects complained of are sure to abound. Keep the surface of the bed where the plants are arranged raked or swept clean. Some of the early varieties are swelling their buds a-pace, and it will be necessary to remove the plants under cover as the petals show colour, as these are sure to suffer with the advent of rains and winds. It is right to keep the plants in the open as long as possible, but it cannot be considered safe to do so after the end of the present month. When that time arrives, we have had to house the plants very hurriedly in some seasons, as a sharp frost, or a severe gale, will prove most destructive; it is therefore most necessary that everything should be in readiness. Fruit houses are generally used to arrange most of the plants in. Early vines should have their growth cut back to, say, a couple or three leaves, which will not injure the vines, and will admit light. Some temporary staging should be arranged on which to stand the pots, and also to walk upon in attending to watering, and so save damaging the roots of the vines situated near the surface. See too that there are no broken panes in the roof, as a leaky roof proves anything but satisfactory, and many fine blooms are ruined by drip.

In the conservatory it will be necessary to water beds and borders copiously in which tree ferns, camellias and other things are planted. Camellias especially would be better for liquid manure, now the buds have formed, and on no account should the root run ever approach a dry condition, or the buds will fall wholesale. All these plants will be the better also for frequent syringing, as it not only encourages growth, but dislodges insects. Creepers trained to the roof are apt to become crowded, and many of the flowering ones will need pruning as the flowers fade. These will include such things as bougainvilleas, bignonias, cobæas, lapagerias, passion flowers, plumbagos, &c., and the removal of old flowering wood will not only secure neatness and make it better for new growth, but more light will reach other occupants later on when we shall have much less sunshine than we are now having.—RICHARD PARKER, *Goodwood Gardens*

KITCHEN GARDEN.

THE storing of winter roots will now be occupying the attention of the gardener. This important operation ought not by any means to be done in a careless manner, for it is not only a waste of time, but of material also, to grow good roots and then allow them to spoil for want of care in storing. Carrots, as a rule, are not very good this season, therefore, extra care should be taken to preserve them. The most suitable place is a cool shed, where a little protection can be afforded in case of severe weather. When stored away in a cellar, unless very cold, the roots start into growth, which causes deterioration, and if this is allowed to continue they become very stringy, and are almost worthless; if stored away in an open shed facing north, with the upper portion exposed, and the lower part covered with sand, they will remain sound for a considerable time; there is no difficulty in covering with a little dry litter in case of a severe frost. As a rule cooks prefer the young roots drawn from the ground; it is, however, not always practicable to grow sufficient of these to supply the requirements of a large establishment, hence the reason for storing the summer crop. Parsnips are far sweeter when used fresh from the ground, but it is always advisable to store a few in case of severe weather, but this should not be done while the foliage is so fresh and green. Beetroots should be stored, as recommended for carrots, but care must be taken in lifting the roots so as not to damage them in any way. The same remarks apply to salsify and scorzonera. Celeriac, on the other hand, ought not to be lifted at present, but when severe weather approaches sufficient should be stored for a supply while bad weather lasts, and what remains in the ground should be earthed up to protect it from frost.

Asparagus beds intended for forcing should have the growths cut off as soon as they turn yellow, so that the crowns may have a rest, before the roots are lifted. Cut down the old stems from globe artichokes and place some litter round the roots at the first convenient opportunity to prevent the frost from injuring them. Leaves will soon be falling apace; these should be collected and placed in heaps ready for making hot-beds. It will not be safe after this date to allow the lights to remain off such things as peas and French beans, as we may expect frost at any time; indeed, we have already registered two degrees, therefore, material should be had in readiness for protection.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

ABOUT this time it becomes necessary in gardens where the accommodation under glass is limited to crowd all available structures with chrysanthemums, bedding plants, and other tender things that have been during the summer months growing outside. Many people object thus to fill their vineries, but I think the objections are more apparent than real where a good grape room is available for storing the bunches. This is a necessity where such a use has to be made of the houses, as fruit will not hang safely on the vines when daily watering of plants has to take place beneath them. Chrysanthemums, especially of the Japanese type, which sometimes require a little fire heat to open them, are very good subjects for late vineries, as the heat afforded helps to ripen the vine wood. A really fine day should be chosen for cutting the grapes, especially where the grape room, as in my own case, is at some distance from the vinery, and can only be reached by making a short journey in the open air. Dryness and warmth of the atmosphere are imperative. The room should have been well ventilated and dried up; and the bottles, filled with fresh spring water, in their places in the racks. In cutting the grapes, I take no account as to which end of the lateral is prepared for insertion into the water, and frequently find it convenient to place the upper or "wrong" end of the shoot in the bottle, and the grapes keep just as plump as if the shoot is reversed. This allows one to leave a little foliage and a fair length of lateral on the vine to finish ripening. See that the shoot goes well into the water and without causing the latter to overflow and drop among the berries or on the floor. I do not sear the exposed ends of the shoots with a hot iron, nor use any other means, such as smearing with styptic to close the pores; the grapes keep just as well without it. Neither do I use any charcoal in the water, as the spring water we have remains perfectly fresh and sweet. All the after attention I give is to keep the room dark and as cool as possible, short of reaching freezing point; occasionally the bunches are looked over for decayed berries, but artificial light is always employed to see them by, for I make it a rule never to open the windows nor the shutters, as the room gets the very little ventilation it needs in other ways, and provided it is in a thoroughly dry state, I believe a room for keeping grapes is best without any ventilation.

While the houses are still empty it will be well to examine the borders once more, and give them another soaking of water if they seem dry; this will in all probability tide them over the winter, but the matter should on no account be neglected. The autumn is the best time for carrying out any lifting of vines, remaking borders, or any other root disturbance that may be thought necessary. Where grapes shank badly it often proves the salvation of future crops to thoroughly remake the borders, and get rid of all unhealthy roots that may have penetrated the subsoil, and especially any that are abnormally thickened at the extremities, for such roots as these are invariable accompaniments to shanked berries, and are best cut away back beyond the immaturely thickened part. Fibrous roots of the normal type will need no pruning beyond cutting away any damaged portions, and they may then be relaid in the border, keeping them well up to counteract the downward tendency in future. Vines in the earliest house should now be pruned and made ready for starting again. They should break freely and well, when started later on, for the sunshine we have enjoyed during the past few weeks has ripened up the wood well, and made amends for the long spells of cold and dulness experienced earlier, and which made things very backward. All wood-work, walls, and the vines themselves should be well scrubbed, using hot water and soft soap for the woodwork, and warm water and Gishurst Compound for the vines; this will ensure a clean start. I do not advise scraping the vines, further than to remove loose strips of bark, or smearing them with the dirty mixtures so commonly used, and should only do the one or the other in extreme cases of insect attacks. I have great faith in what I recommend above as cleansing agents when vigorously and plentifully applied.—J. C. TALLACK, *Livermere Park Gardens.*

Single China Asters.—What charming subjects these are during the exceptional dry weather we are now experiencing. They are single-flowered forms of a half-hardy annual, though little known in gardens yet. Growing fifteen inches or so high, and producing delicate lilac blossoms freely, they are at once valuable, either for making a display in the mixed border or in lines. Perhaps for the decoration of vases indoors they are at their best, as the blooms fully four inches in diameter, with a full complement of golden anthers in the centre, seem to lend themselves to this form of decoration perfectly. I have grown them this season as one of Messrs. Barr's novelties, and am pleased with the results.—E. M.

REMARKABLE CHANGES IN BUTTERFLIES.

At the meeting of the British Association at Bristol, one of the chief attractions in the section of zoology and physiology was the communication from Professor E. B. Poulton and Miss C. B. Sanders, on an experimental inquiry into the struggle for existence in certain insects.

Professor Poulton opened the proceedings by stating that the resemblance in colour of many species of insects to the surroundings was largely attributed to the effect of the struggle for existence; but this belief had never been subjected to experimental inquiry, by placing insects in the natural surroundings and keeping a record of their subsequent fate. The chrysalis of certain butterflies had the power of adapting its colour to the background on which it was placed; and this seemed a suitable subject for inquiry, because the chrysalis, being immovable, could easily be observed during its development. Some scientific authorities had denied the existence of any struggle for existence taking place at this stage, contending that it was of too short a duration for adaptability of colour to affect the chances of life. It was to throw light on this question that his experiments had been undertaken. The species selected for observation was, mainly, the chrysalis of the tortoiseshell butterfly, which was found in a series of shades, ranging from bright golden to dark yellow; and each shade could be produced by placing the chrysalis in appropriate surroundings. The golden form was produced on the nettle, the food-plant, and the darker forms on rocks, walls, fences, and tree trunks. The total number of pupæ fixed in these various surroundings was over 600. After having been fixed, the pupæ were constantly watched and a record kept of what happened to them. Some died, but over 550 were either carried off by natural enemies or emerged as butterflies.

The experiments were conducted in three different localities: first in Oxford, in the grounds of Magdalen College; secondly in the Isle of Wight, and thirdly in Switzerland. The results obtained at Oxford were extremely positive, while those obtained in Switzerland were strongly negative, and those obtained in the Isle of Wight were of an intermediate character. In Oxford, out of 59 pupæ exposed to their enemies, 55 disappeared and only four emerged. In the Isle of Wight, of 378 pupæ exposed, 259 were carried off and 119 emerged. In Switzerland, of 112 exposed, only 17 were carried off, while 95 successfully emerged as butterflies. The Oxford experiment was carried on from June 25 to July 23 in the present year; and the Isle of Wight experiment from August 2 to September 3. During the earlier period there was a greater ratio of extinction, which might be accounted for in some degree by the fact that the birds would still be feeding their young, and would therefore require more food. Oxford, moreover, was a place in which birds abounded; while in Switzerland, where the ratio of extinction was smallest, there was a marked scarcity of birds. There was a strong suspicion that the disappearance of the pupæ was due to birds. At Oxford, of 29 pupæ affixed to bark and tree trunks, all disappeared. Of four exposed on fences and posts, of four more exposed on walls, all were taken, and of 11 exposed on the ground, all were taken. But of 11 affixed to nettle leaves, four emerged and seven only were taken. In the Isle of Wight the number of pupæ observed was larger, and the struggle for existence was less severe. Of 209 affixed to bark and trunks, 135 were taken and 84 emerged. Of 98 affixed to fences, where the pupæ were more easily visible, eight emerged. On stone walls, 12 emerged out of 26; and on the nettle, 15 emerged out of 35. In Switzerland, 31 out of 35 placed on rocks emerged; while at a lower altitude 16 out of 21 affixed to bark emerged. At Oxford it was found that out of a number of pupæ of different shades of colour affixed to a stump the lightest went first.

In the Isle of Wight, of the pupæ affixed to a row of oaks, the lightest in colour went first, while the darker remained. This was difficult to explain except on the ground that conspicuousness was an element; but other elements of danger had to be considered. For example, in the same locality, the destruction varied very greatly. In one corner of a field all the pupæ might disappear in a few hours, while in another corner of the same field none would be taken. It seemed possible, too, that the pupæ being placed near together might lead to more speedy destruction, by inducing the enemy to search in the neighbourhood of the first find. Therefore a plan of scattered exposure was adopted, and pupæ were affixed at distances of more than 100 yards. The necessity of this was brought home by a curious circumstance. On entering a copse where pupæ had been exposed, the observers were met by a robin, who hopped up in a seemingly expectant manner, as though it knew what was going on. But when, to guard against this vitiation of the observed results, the pupæ were fixed at night time by lantern light, no marked difference of results took place. There could be little doubt that the enemies of the pupæ were birds, for the pupæ were generally fixed at a height of 3 feet or 4 feet above the ground; but it had been suggested that positive proof of this conclusion should be obtained. Miss Sanders accordingly undertook to watch a tree on which pupæ had been placed. At first she saw nothing during several hours' watch, although some of the pupæ were found to have disappeared; but at last she was rewarded by discerning a tit walking over the trunk of the tree. In Switzerland the pupæ were much less exposed to the risk of destruction; but the critical period was merely shifted to the larvæ stage; for it was found that in Switzerland the larvæ were infested with parasites which were absent in England. Possibly the presence of the very birds which were so destructive to the pupæ were also favourable to them in protecting them at the larvæ stage from parasites. The experiments which had been described were only a preliminary to the inquiry which was necessary, and he hoped in future experiments to make use of the chrysalis of the peacock butterfly, which had only two forms. The value of these experiments depended wholly on the trustworthiness of the methods adopted.

Miss Sanders explained the methods adopted for fixing the chrysalids so as to avoid all possibility of their escape or falling from the position allotted. In the discussion which followed, Professor Ray Lankaster, Professor Meldola, and Sir John Lubbock took part. The latter observed that though the experiments might not be very conclusive, they were very suggestive. It was clear that the colour of the chrysalis depended to a certain extent on the external conditions, but in these experiments a good deal of the protection afforded to the pupæ would be by the roughness of the ground on which they were placed rather than by colour. Did Professor Poulton think that the extra protection enjoyed by pupæ suspended from nettle leaves was due to the sting of the nettle? One effect of this communication would, no doubt, be that a larger supply of the chrysalis would be forthcoming in the future. He remembered that on one occasion he was anxious to get humble bees in the dead of winter. He asked the assistance of entomologists, and got a few, but not nearly enough. When, however, he offered 6d. each for humble-bees he was flooded with them; and when the price was reduced to 4d. they still poured in. It was only on a further reduction to 3d. that the supply became equal to the demand. It was clear from the paper that, though the chrysalis stage was of short duration, it was very dangerous; and one could realize how much interesting work in natural history could be performed without elaborate apparatus, but simply by the use of good eyes with a good brain behind them.

SUMMER BEDDING AT HAMPTON COURT.

That there has been manifested this season a distinct effort to render the bedding in these very popular public gardens more attractive and less stereotyped than hitherto there can be no doubt, and the new superintendent, Mr. Gardener, is entitled to all praise. The lawns have been better kept also, and greater air of neatness has prevailed. Probably there is still, and in spite of the fact that some beds have been turfed over, far too great a plethora of beds and bedding. The result is naturally too much repetition, too much to see to during the summer season, and too little labour to enable that high excellence in keeping the main lawns, without which much of the bedding becomes, as the season advances, too rough and uneven. All the beds beneath the lines of yew trees might well be dispensed with. Some fine vases and baskets, into which the roots of the yew trees would not enter, would be so much better. A number of round beds, with roses attempting to climb up iron poles in the centre, are lamentable failures, and might well be dispensed with, and some of the long beds, much too large, materially reduced in size. Certainly sub-tropical plants and various strong-growing mixtures do well in them, but the effect is after all hardly a reward for the great labour involved in preparing the stuff used and planting these long beds. Fewer beds, and more effort to produce fine effects, would be highly appreeiated.

It is interesting to note that whilst only one of the old carpet or mosaic-planted beds is in evidence this year, yet is it formed late in the season, as it has been from its planting the most perfectly-kept, the freshest, best-coloured, and on the whole the most attractive. The caterers for public approval in bedding should hesitate, whatever may be said to the contrary, before they expunge carpet beds altogether from the gardens. There are dozens of beds, especially of mixtures, that have not one tittle the attractiveness that this carpet bed has; its edging is a band of Sedum glaucum, into which is set neat plants of Acheveria Peacocki; inside of that is a very neat line of Hernaria glabra, with a few small agaves dotted into it; then comes a narrow line of Leucophyton Browni, and the design is worked out very effectively with various well-coloured alternantheras and mesembryanthemum, a few dot plants breaking the flatness of the bed. But the begonia, with various forms, constitutes the most attractive of flowering plants; none others can equal it in any way. It is the flowering summer bedder *par excellence*. There is, for instance, a singularly lovely combination of rather dwarf plants of the brilliant, small double scarlet Lafayette, planted thinly with the silvery Leucophyton Browni, as a foil. The latter, in its earlier stages of growth, should have been pegged a little to keep it broader; but all the same, it is the most beautiful combination in the gardens. The bed is marred by an edging of dwarf blue lobelia, which not only does not harmonise, but, being almost out of bloom, are getting, as all the lobelia edgings are, rough and demoralised, and would have been so much better away. I should like to see the lobelias dispensed with another year. There is no better blue-flowered edging plant for constancy and effect than is the dwarf perle-blue ageratum, six inches in height, but in spite of its great excellence it is not at all commonly grown. Then there are opposite the garden entrance two very effective purple begonia beds. These have in one case magenta or rose-coloured doubles, not large flowered, the plants fifteen inches in height planted on a carpet of the white-flowered sweet allyssum, and the other of orange scarlet doubles, twelve inches in height, on a similar carpet, both beds being neatly edged with Golden Treasure fuchsia. A large bed of single large flowered scarlet begonias on a carpet of Koniga variegata, is very effective. A few small plants of Auracaria excelsi dotted in are too dwarf, and seem to have suffered from cold, as the foliage is rather pale. A very large mass of the fibrous-rooted atropurpureum begonia, topped with a few acacias and edged with the variegated Stephanophoton labrum, gives a fine body of colour; also a nice effect is got from a bed of mixed begonias thinly planted, associated with Centaurea candidissima or dwarf Golden Feather, numerous plants of Eulalia japonica being used for top dressing. Here an edging of blue lobelia seems out of harmony, as also is a further bed of white, yellow, and sulphur begonias, with which is intermixed mauve violas. Both begonias and fuchsias give better effect when planted on close growing carpets than when the original carpet plants run up and materially cover them. Some beds that showed the troubles that may arise from certain unsuitable mixtures were such as Viola Blue Bell fighting for supremacy with pelargoniums, Verbena venosa overpowering petunias, or marguerites mastering scarlet pelargoniums. A mixture of plumbagos, tobaccos, cannas, and other plants had grown wild in spite of the dry weather; indeed, some beds seemed to have been much too liberally watered. But there can be little doubt but that such combinations will be avoided next year. Certainly many such mixtures may look very well in July, but are all abroad in September. It is in respect of constancy to character amongst other high qualities, that begonias and fuchsias seem to distance all other bedding flowering plants.

There was just coming into bloom a good bed of Lilium speciosum. These were very late, but they bid fair to make a good show in the autumn. The defect of the bed was its carpet of mixed violas which had become very ragged. So many of these need to be hard cut or pinched over early in August to induce them to bloom afresh from lower new growths late in the season. Begonia worthiana, formerly used so plentifully, is now in evidence in but one bed only, where it forms a somewhat dense centre. It is edged by blocks, about twelve inches wide, of Semperflorens rosea and alba, both dwarf and very effective, with taller blocks, alternated, of atrosanguinea. Interspersed as dress plants were Eulalia japonica and variegated maize. Dahlia scarlet bedder, or, as sometimes called, Glare of the garden, makes some effective masses, and white and yellow autumn flowering chrysanthemums are blooming profusely. The long mixed border that margins the broad walk has been unusually well planted this year and has given an abundance of bloom. How much these gardens are frequented, though some fourteen miles from London, may be seen on ordinary days, but on Sundays especially, when the visitors number several thousnds. A. D.

Apricots and Peaches.—These were a good crop, and would have swelled off and ripened of a good colour had we not been so pestered with wasps, which caused us to pick the bulk of the fruits before they were ripe. We have had some grand sunny weather during the past month. I should say there will be good crops of hardy fruits generally next year. The wood on healthy trees is ripening up well, I can see. Apricots generally do very well hereabouts, where fairly good cultural treatment is given to the trees. Our main kinds are Moor Park, Hemskirke, St. Ambrose, Kaisha, and Large Early. Were I making a new border, and replanting, I would give the roots a border, say, eight feet in width for a twelve feet high wall, and let them have sole possession of it. I have had another object lesson bearing upon this point; this year, when clearing off a three-year-old patch of strawberry plants from a South border in front of our apricot wall, I found the whole surface of the soil a network of apricot roots. Peaches and nectarines outdoors do not give us good crops of fruit oftener than one season in three. We find Hale's Early and Condor the best peaches for outdoor culture, the former in particular is very satisfactory.—H. J. Clayton, *Grimston Park Gardens.*

EXHIBITIONS AND MEETINGS.

CHELTENHAM FLOWER SHOW.

AFTER the lapse of one or two seasons the autumn show was held in the Winter Garden on September 21, and proved an encouraging success. The appearance of the flower tent was rendered charmingly effective by the four central groups, each arranged on a space of three hundred square feet, Mr. J. Cypher occupying the post of honour with a lovely design, having a bold Kentia Forsteriana with large-leaved crotons and tall bamboos as a centre, from which sprang four arches dressed with drooping asparagus and sprays of Dendrobium Phalænopsis Schroderiana, Oncidium incurvum, and other graceful orchids, pretty bits of crotons and other foliage plants; between the arches were large mounds each set with a handsome specimen of Cocos Weddelliana, backed by crotons, alocassias, caladiums, ferus, asparagus, and fine examples of Dendrobiums formosum and Phalænopsis Schroderiana, Oncidiums Forbesi and incurvum, a few Cattleya labiata and other orchids, the groundwork composed of crotons, ferns, &c., mixed with white forms of Lilium speciosum; Mr. G. W. Marsh, gardener to T. P. W. Butt, Esq., Arle Court, a fairly good second, having a fine spreading Kentia Balmoreana as a centre, with four bridges lightly dressed with graceful foliage and grand racemes of Dendrobium Phalænopsis Schroderiana and other orchids; a number of the ruby form of Lilium speciosum was used with much effect; Mr. W. Finch, Coventry, third, the bold centre being formed by a graceful Phœnix rupicola, around which were disposed pancratiums, crotons, &c.; the four angular mounds being set with Cocos Weddelliana, lilies, caladiums, crotons, and smaller subjects forming the ground work; a special prize being accorded to Mr. W. Vause, Leamington, for a design (much in the style of the first and second sets) in which crotons, ixoras, liliums, and orchids were used, but lacking finish. In the plant classes, Mr. W. T. Orchard was the only exhibitor of six fuchsias; Mr. W. Lusty, gardener to Colonel Rogers, was placed first for dwarf grown well flowered zonal pelargoniums; Rev. J. P. Davies, Mansfield, second, and Mr. H. T. Young, third.

Cut flowers were a somewhat extensive section, there being a large number of dahlias in competition; for twenty-four varieties there were eight competitors, the first prize went to Messrs. Heath and Son, whose finest blooms were Colonist, W. Rawlings, John Walker, Prince of Denmark, W. H. Williams, Eclipse, Flora Wyatt, Arthur Acock, J. T. West, and W. Powell. Messrs. Keynes, Williams, and Co., Salisbury, second, very fine, being S. Mortimer, R. T. Rawlings, A. Acock, Florence Tranter, Harry Keith, Mrs. C. Noyes, Dorothy, Dr. Keynes, Mr. Chamberlain, and Mr. Spofforth; Mr. W. Treseder, Cardiff, third, for a dozen distinct. Mr. Thomas Hobbs, Bristol, was placed first, having large spherical specimens of Chieftain, R. T. Rawlings, Dr. Keynes, Shirley Hibberd, Edward Boston, Muriel Hobbs, Willie Garrett, Prince of Denmark, and Harrison Weir; Mr. F. Harris, Bristol, second. Roses were staged in loose bunches of twelve varieties. Seven competed, Mr. John Mattock, Headington, Oxford, first, putting up large gatherings of Mrs. J. Laing, Anna Olivier, Mrs. S. Crawford, Marie Van Houtte, Maman Cochet, Souv. d'Elise Vardon, Maréchal Niel, Comtesse de Nadaillac (the last five named being wonderful buds), Princess of Wales, Ernest Metz, and Kaiserin Augusta Victoria; Messrs. Townsend and Sons, Worcester, and Messrs. Heath and Son second and third; Mr. G. Garraway, Bath, receiving a high-class card. Table decorations were very tastefully arranged: Rev. J. P. Davies, first; Miss H. F. Smith, second; Mr. W. Vause, third. Mr. E. Hall, Bath, headed the list for two dozen quilled asters; Mr. F. Lindsay, Frome, leading in the other section for incurved or reflexed. Mr. Cypher presented the best collection of zonal geraniums in triplet trusses; Mr. G. Humphries, Chippenham, securing the card for a dozen spikes of gladioli, with Mr. Mattock second. Hardy perennials in a dozen bunches each were represented by six collections: Mr. Cypher, first; Messrs. W. Treseder and Messrs. Heath and Son, taking lower awads; Mr. G. Garraway being the only exhibitor of sweet peas arranged on thirty feet superficial.

Fruit was a good section, grapes especially so. For dual clusters of two varieties of black, Mr. May, gardener to H. O. Lord, Esq., Charlton Kings, was first with fine clusters of Gros Maroc and Alicante, grand in colour and berry; Mr. A. James, gardener to F. H. Wiggin, Esq., Woolston, second, with Alicante and Black Hamburg, while for three clusters, the first prize was awarded to Mr. May, who had Black Hamburg, Madresfield Court, aud Alnwick Seedling. For two clusters of white, Mr. James led with well-finished clusters of Muscat and Foster's Seedling; Mr. F. Rea, gardener to Miss Southwood, second, with Bowood Muscat and Trebianno; the cards for three bunches going to Mr. James, who had, in perfection, Muscats. Amateurs' class for black produced a number of fine exhibits, Mr. May first, with Gros Maroc, Messrs. W. James and W. Lusty, putting up Hamburgh. For eight dishes Mr. James was strong with Gros Maroc and Muscat grapes, Woolstone Gem melon, Bon Chretien pears, Pitmaston Orange nectarines, Prince of Wales peaches, Angelique figs, and Black Gage plums; Mr. W. Child, gardener to the Earl of Coventry, Croome Court, second; Mr. W. Lusty, third; the last named was first for four varieties, with Gros Maroc grapes, Triumph melon, Pine Apple nectarines, and Princeof Wales peaches; Mr. F. Taylor, Prestbury, second; and Mr. Marsh, third. Peaches were a good class, Mr. Lusty, first, with Royal George; other varieties staged being Prince of Wales, Alexandra Noblesse, and Walburton Admirable. Nectarines being Pine Apple, Pitmaston Orange, &c., Mr. Lusty, first. A number of melons were submitted, Rev. J. P. Davies, first, for Blenheim Orange. There being nine exhibitors of four dishes of plums, Mr. James heading the list, the kinds on view were Golden Drop, Magnum Bonum, Victoria, Jefferson's, Pond's Seedling, Monarch, Kirke's, Green Gage. and Transparent Gage. For one dish of dessert apples sixteen entered, Mr. G. Garraway, first; while for a dozen culinary, thirteen entered, Mr. W. Restall securing the card with grand fruits of Peasgood's Nonsuch. For a dozen varieties (dessert and culinary), nine competitors staged, and a very fine display resulted, Mr. James filling the post of honour; Mr. W. Child, second; Mr. W. Restall, third; the pears winning being Bon Chretien.

Among the vegetables there were a dozen very fine dishes of tomatos, a few cauliflowers, the turnips and carrots evidenced a dry growing period; some sixteen dozen of potatos being staged; and of onions, the flat and globular types were represented by bulky ripe specimens. Summarised, the first prizes went to Mr. G. Garraway, for nine dishes, six dishes, twelve dishes of potatos, one dish of round potatos, runner beans, peas, and cucumbers; Mr. Mattock, first, for tomatos; Mr. A. Cook led for flat onions, celery, and parsnips; Mr. S. E. Cook, for turnips and beet; Colonel Thoyts, for kidney potatos; and Mr. Llewellyn Evans, for carrots.

Miscellaneous exhibits included a very showy lot of cactus dahlias from Messrs. Keynes, Williams, and Co., Salisbury; dahlias in variety from Mr. W. Treseder, Cardiff; dahlias from Messrs. Heath and Son, Cheltenham; Messrs. White and Son, Worcester, hardy flowers; Messrs Yates and Son, Cheltenham, hardy flowers and tomatos; Mr. H. Deverill, Banbury, hardy flowers; Messrs. Fuller and Maylon, Cheltenham, large collection of apples and pears; Messrs. Hopwood and Sons, Cheltenham, apples and pears; and roses in quantity from Mr. J. Mattock, Oxford, and Messrs. Townsend and Sons, Worcester.

ORMSKIRK HORTICULTURAL SOCIETY.

THIS exhibition was held recently at the Victoria Athletic Grounds. The entries were satisfactory, considering the extreme charge demanded for entrance fees. Surely it would be advisable to charge a moderate entrance fee, so as to secure a larger number of exhibitors. In the plant section Mr. B. Ashton, gardener to Lord Lathom, secured the chief honours, gaining first prize in the following classes: Group of plants arranged for effect, four stove and greenhouse plants, two palms, four table plants, two hardy ferns, and two pots of liliums; Mr. E. Ormesher was first for two fuchsias; for two zonal geraniums, Mr. Henry Bank staged the best; for two tuberous begonias, Mr. John Benson won with a good pair; Mr. A. J. Stanley, Thronton Nursery, took the lead for a single bouquet.

Fruit, although not very extensive, produced some good dishes. For two bunches of black grapes Mr. A. Francis, gardener to Miss Carver, Southport, won with well-coloured Black Alicantes, Mr. Ashton and Mr. T. Rimmer following. For two bunches of white, Mr. B. Ashton won with Muscat of Alexandria. For six peaches, Canon Blundell, Mr. B. Ashton, and Mr. T. J. Salway, Ludlow, were placed as named. For six plums, Mr. Thomas Ball won with Pond's Seedling; for one melon, Mr. Ashton was first; and for a dish of damsons, Mr. E. H. Wood, Ludlow, won with Shropshire.

For twenty-four cut roses Mrs. Parr, Lathom, had the best of a moderate lot. Twelve varieties of hardy herbaceous and bulbous cut-flowers brought five competitors, three of whom were disqualified through including dahlias, roses, clematis, &c.; in nearly all the stands the wording of the schedule appeared to be overlooked. The winning lot by Mr. Alfred Dower, Maghull, included a bunch of gladiolus, which contained about ten varieties; Mr. B. Ashton was second. For six cut roses Mr. E. Ormesher took the lead. Six double dahlias were well shown, Messrs. E. Ormesher, Henry Banks, and Thomas Alty being placed as named. Six pompon dahlias brought a strong lot, the winners being Messrs. T. Ball, T. Morris, and H. Banks. For six cactus dahlias the exhibitors were placed in the following order: Messrs. J. Benson, R. Benson, and E. Marsh. For six single dahlias, Mrs. Parr, Messrs. F. W. M. Gardiner, Ormskirk, and T. Alty were the winners. For six asters, six stocks, and twelve pansies, Mr. T. Alty was to the fore. Mr. Ball won for six spikes of gladiolus, and twelve carnations; Mr. A. Dower, for six hollyhocks; Mr. H. Banks, for twelve marigolds; Mr. T. Morris, for twelve African marigolds; and Mr. H. Banks, for twelve zinnia blooms.

Vegetables were undoubtedly the finest feature of the show. For the collection of not less than six varieties, Mr. T. Alty was placed first, staging twelve varieties; Mr. Ashton, with an altogether better lot, was placed second, staging ten varieties. It would be better in this class to state the number of kinds or varieties. Leading first prize winners were Messrs. Laycock and Hall, J. Nightingale, Mr. J. Taylor, Mr. T. Alty, Mr. B. Ashton, Miss Carver, Mr. G. Woodman, Mr. Job Harrison, and Canon Blundell.

For six culinary apples, Mr. B. Ashton won with Lord Suffield; for six dessert apples, Mrs. Parr was first; and for six ripe pears, Mr. R. C. Welsby led. The committee should impress upon exhibitors the importance of naming all exhibits where possible.

The potatos were a splendid lot, large, clean, and of good shape. For white round, late, Mr. B. Raymond won with Goldfinder. For white, early, flat and white, early round, Mr. D. Berry, Lathom, won in both classes. For white flat, late, Mr. T. Wainwright was to the fore with Up-to-date. For six white early kidneys, Mr. Gardiner took the lead with Snowdrop; for late variety, Mr. T. Wainwright showed Reading Giant. For round, coloured, Mr. T. Alty won with Reading Russet. For flat kinds, Mr. B. Ashton staged Mr. Bressee. For a coloured kidney, Mr. B. Raymond, Ludlow, led the way wlth Hedgott Purple. For the best collection of six varieties, Mr. B. Ashton was first, his lot including Goldfinder, Mr. Bressee, Carter's Snowball, Sutton's Abundance, Carter's Monarch, and Duke of York, all in very fine condition. The weather was fine, and the show was fairly well patronised.

SHIRLEY GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

THE usual monthly meeting was held at the Parish Room, Shirley, Mr. B. Ladhams presiding over a fair attendance. The lecture was on "Vegetable Culture," and was given by Mr. George Garner, The Gardens, Cadland Park, Hythe, Southampton. It was a sound, practical discourse on the up-to-date methods of growing all the high-class vegetables. Necessarily the instructions were much condensed, but at the same time the chief points of good culture were dwelt upon. Mr. Garner believes in much mulching of crops, and this season has brought out the value of this so very strongly, that he made the most of this point. At the close of the lecture there was a lively discussion chiefly as to the value or otherwise of seaweed as a manure. A hearty vote of thanks to the lecturer closed the business of the meeting.

There was a bright little display, and some good vegetables were exhibited for some small prizes. C. G. Stuart Menteth, Esq., J.P. (gardener, Mr. W. Risbridger) was awarded first, and the president, W. F. G. Spranger, Esq. (gardener, Mr. H. Curtis), second for six sorts of vegetables. Mr. J. R. Cole was first and Mr. C. Curtis second for four sorts of vegetables, open to cottagers only. Cannas, dahlias and cockscombs were shown by Mr. E. J. Wilcox; seedling pelargoniums, dahlias, &c., by Mr. F. Cozens, and herbaceous plants by Mr. B. Ladhams.

Chrysanthemums at Woking.—Although early in the season for specimen chrysanthemum blooms, I was agreeably surprised to find, on a recent visit to Mr. Shoesmith's nursery at Woking, some well-developed flowers of Edwin Molyneux. They were from crown buds, and, as such, were remarkable for the rich colouring so prominent in this variety. To my mind, I think that early flowers of this sort display the colour to more advantage than those of later growth. Another variety in flower was Phœbus, also from crown buds. The bright golden colour was noticeable for its richness, while in size and shape it would not have disgraced a "board" at a November show. A few plants of that fine white variety, Madame Gustave Henry, were carrying some well-developed flowers. This is one of M. Calvat's novelties of 1896, and is likely to hold a place for some time as a good exhibition variety. Its growth is strong and vigorous, while the flowers are of good shape and very pure. On inspecting the collection, it was a pleasure to see, from the healthy and vigorous condition of the leaves, it was free from that dreaded disease, the chrysanthemum rust. The buds now developing give promise of fine blooms, which will doubtless figure at forthcoming shows, and add further to the reputation of a good grower of this most popular family.—E. S.

ROYAL HORTICULTURAL SOCIETY'S GREAT FRUIT SHOW.

The fourth of the series of great autumn fruit shows held at the Crystal Palace under the auspices of the Royal Horticultural Society was opened at mid-day on Thursday, and, although weak in one or two features, may be described as a splendid success. The great palace of glass is filled from end to end with fruit remarkable for its high quality, and regarded as a whole no better demonstration of the splendid capabilities of the United Kingdom for the production of hot-house and hardy fruits could well be desired. Apples, as in former years, constitute the chief feature, and, as might have been expected, they are in consequence of the prolonged drought somewhat below the average in size. Excepting in bulk these useful fruits are fully equal to the high average of previous years, and the large number of classes devoted to them contain much to interest both cultivator and consumer. The comparative scarcity of pears in this country is made evident in several of the classes for these fruits, but less so than might have been expected. Miscellaneous collections form as usual a great and attractive feature, but we must defer notice of them until our next issue.

The present exhibition is of a more comprehensive character than any of its predecessors, for the Council very wisely introduced a section for market growers, with a view to demonstrate the best methods of packing fruits for commercial purposes, and they also added some twenty classes, two each for specified zones in England, and two each for Scotland, Ireland, and Wales. The second of these two sections was introduced to enable exhibitors to compete under more equal conditions than is possible in classes open to the United Kingdom; and the great natural advantages of Kent are shown by the fact that no other county is associated with it. The arrangements of this immense gathering have been skilfully planned and admirably carried out, and the warmest praise is due to the Rev. W. Wilks, Mr. S. T. Wright, and other members of the Royal Horticultural Society's staff for the services rendered.

COLLECTIONS OF FRUIT.

Collections of hothouse and hardy fruits were comparatively few in number, but those staged were all more or less good, and the contributions to the several classes formed a feature at once interesting and attractive. In competition for the prizes for twelve dishes, to include at least six kinds, Mr. J. McIndoe, gardener to Sir Joseph Pease, Bart., Hutton Hall, Guisborough, Yorks, obtained premier honours with a collection remarkable for its evenness and general excellence. The collection comprised a shapely, well-ripened Queen pine, good Muscat of Alexandria and Gros Maroc grapes, remarkably fine Sea Eagle and Admirable peaches, Pitmaston Orange nectarines, Souvenir du Congrès and Williams' Bon Chretien pears and Lady Sudeley apples, fairly good Brown Turkey figs, excellent Bryanston Green Gage plums, and a well-finished Champion melon; Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was a very close second, with an admirable collection, in which Muscat of Alexandria and Black Hamburgh grapes, Washington and Gascoyne's Scarlet apples, and Doyenne Boussoch and Doyenne du Comice were especially well represented. There were five entries in the class for eight dishes to contain at least four kinds, and at the head of the several of the competitors was Mr. J. Dawes, gardener to M. Biddulph, Esq., M.P., Ledbury Park, Ledbury. The collection for which Mr. Dawes received the premier award was distinguished by its uniformity and high quality, and contained Gros Maroc and Muscat of Alexandria grapes, Worcester Pearmain apples, Williams' Bon Chretien pears, Jefferson's plums, Princess of Wales peaches, Pine Apple nectarines, and an unnamed melon. Mr. Tidey, gardener to W. K. D'Arcy, Esq., Stanmore Hall, Middlesex, followed closely for second place with a collection, in which were exceptionally fine dishes of Walburton Admirable and Sea Eagle peaches, Alnwick grapes, and Humboldt nectarines. Mr. F. Cole, gardener to Sir Charles Russell, Bart., Swallowfield Park, Reading, was third with a good collection, including superb clusters of Alicante and Muscat of Alexandria grapes.

There were five entries in the class for a collection of hardy fruit, not exceeding [illegible] dishes, grown entirely in the open air; here, Mr. R. Potter, gardener to Sir Mark Collett, Bart., St. Clere, Kemsing, Sevenoaks, won the covetedaward with a grand display, that contained splendid apples and pears in the leading varieties, Warrington gooseberries, Princess of Wales, Dr. Hogg, Royal George, and Lord Palmerston peaches, Brown Turkey figs, mulberries, plums and gages, and currants; it was a magnificent display, tastefully set off by berberis sprays and ivy. Mr. J. Powell, Dorchester, was second, also with a grand lot of fruit that included Sweetwater grapes, grand Galway peaches, Pineapple nectarines, plums and gages, red and white currants, medlars, apples and pears, cherries, and nuts.

The best collection of three dozen dishes of fruit grown to illustrate the value of orchard house culture, came from Mr. R. Potter, who showed Black Hamburgh, Foster's Seedling, and Gros Maroc grapes, plums, gages, peaches, nectarines, all grandly finished, and some magnificent apples and pears, the latter including wonderful specimens of Uvedale's St. Germain, Triomphe de Vienne, Beurre Diel, and Pitmaston Duchess; a first-class display of splendid fruit. Mr. J. McIndoe, gardener to Sir J. Pease, Bart., Hutton Hall, Guisborough, had to be content with second place, but he had fine Gros Maroc, Foster's Seedling, and Alnwick Seedling grapes.

GRAPES.

Grapes were, on the whole, below the high average of previous years, but the collections were numerous, and formed an attractive feature. There were four competitors in the class for six distinct varieties, two bunches of each, and the premier award was made in favour of Mr. J. H. Goodacre who staged medium-sized and well-finished clusters of Alnwick Seedling, Muscat of Alexandria, Madresfield Court, Black Hamburg, and Alicante; Mr. F. Cole was a capital second with Foster's Seedling, Muscat of Alexandria, and Cooper's Black of exceptionally high quality; Mr. W. Taylor, gardener to C. Bayer, Esq., Tewksbury Lodge, Forest Hill, S.E., was third with a collection remarkable for size of bunch and berry, but the clusters were mostly somewhat deficient in colour. The bunches of Muscat of Alexandria were the most noteworthy, these being of large size, shapely, and of a rich golden hue. In competition for the prizes for three varieties of grapes, two bunches of each, Mr. J. Dawes obtained premier honours with finely-developed clusters of Muscat of Alexandria, Alicante, and Gros Maroc; Mr. A. Belcher, gardener to Sir [illegible], Cranleigh, Surrey, was second with a good collection, in which the clusters of Alicante were the most meritorious; Mr. J. Jones was third, and had [illegible] and well-coloured bunches of Madresfield Court.

The best of the classes for triple bunches of specified varieties of grapes was that for Black Hamburg, in which there were seven entries. The contributions to this class were, on the whole, decidedly poor, the bunches being mostly small and indifferently coloured. The best examples were those from Mr. F. Cole, Mr. W. Mitchell (gardener to J. W. Fleming, Esq., Chilworth Manor, Romney), and Mr. J. H. Goodacre, to whom the prizes were awarded in the order of their names. Madresfield Court were but little in advance of the Black Hamburgh, the bunches being, on the whole, much wanting in size. Mr. W. Mitchell was successful in obtaining premier honours with medium-sized bunches with good berries, and finely coloured. Mr. J. Jones, York House, Malvern, and Mr. J. H. Goodacre were second and third. There was a strong competition in the class for Gros Colmar and Gros Maroc, and the premier award was made in favour of Mr. W. Allan, gardener to Lord Suffield, Gunton Park, who had huge clusters of Gros Maroc, distinguished by the large size and superb colour of the berries; Mr. W. Mitchell was second, with small clusters of the Gros Maroc; and Mr. George Reynolds was third, staging well-finished bunches of the same variety as that for which the first and second awards were made. The class for Alicante was well filled, and the long line of huge, highly-coloured clusters produced a striking effect. Mr. W. Allan was awarded the first prize in the class, and deservedly so, for the bunches were of the largest size, finely shouldered, and superbly coloured; Mr. W. Howe, gardener to Sir H. Tate, Bart., Park Hill House, Streatham Common, came a close second, with bunches remarkable for high finish; and Mr. F. Cole, who was third, had excellent bunches. Lady Downes was represented by four dishes, and the best of these was shown by Mr. W. Taylor; Mr. W. H. Bacon, gardener at Mote Park, Maidstone, and Mr. J. Dawes were second and third. In competition for the prizes for any black grape other than those referred to above, Mr. W. Mitchell was first, with huge superbly-coloured bunches of Mrs. Pince's Muscat; Mr. J. Hudson was second, with rather spare clusters of Appley Towers; and Mr. Tidey was third, staging Alnwick Seedling. The class for Muscat of Alexandria was the strongest of the grape classes, and included a considerable number of entries evincing high class cultural skill. Mr. A. R. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, was awarded the clock, value £5, offered by Messrs. Wood and Son as the first prize for magnificent clusters; Mr. G. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, was second with large well-finished bunches. There were four entries in the class for Mrs. Pearson, and the awards were made in favour of Mr. W. J. Empson, gardener to Mrs. Wingfield, Ampthill House; Mr. Reynolds and Mr. G. Lane were awarded the remaining prizes in the order of their names. There were some interesting contributions to the class for any white grapes other than those mentioned, and, as a result of the competition, Mr. G. Reynolds was first with excellent bunches of Chasselas Napoleon; Mr. G. Lane was second with the same variety; and Mr. W. Allan was third with Duke of Buccleuch.

NURSERYMEN'S CLASSES.

In the class for a collection of fruit trees bearing fruit, in pots, three prizes were offered, viz., gold, silver-gilt, and silver medals. There was, however, but one exhibitor, Messrs. T. Rivers and Son, Sawbridgeworth, who gained the gold medal with a grand display of grandly-grown plum, peach, apple, pear, and fig trees, finely fruited, and in a beautiful condition. A few of the finest trees were: Rivers' Late Orange plum, a golden variety; President and Pond's Seedling plums; Albatross and Gladstone peaches; Emperor Alexander, Blenheim Pippin, Bijou, and Melon apples; Marie Louise, Conference, Pitmaston Duchess, and Louise Bonne of Jersey pears. The whole group was well set up, and on this occasion no pulled fruits were staged beneath the trees, but a few dracænas and selaginellas were used as edging.

Messrs. G. Bunyard and Co., Maidstone, Kent, secured the gold medal offered as first prize in the class for a collection of hardy fruits grown partly or entirely under glass, to illustrate orchard house culture; splendidly fruited trees in pots were used as a background, especially fine being the specimens of Grand Duke plum, Doyenne du Comice, Durondeau, Vicar of Winkfield, and Pitmaston Duchess pears; Lady Palmerston peaches, and Cornish Aromatic apples; square boxes and baskets of highly-developed plums, pears, tomatos, &c., were arranged next the trees, and dishes of fruit completed the arrangement. There were some wonderfully fine examples of Washington, Reinette du Canada, Gascoigne's Scarlet, Peasgood's Nonsuch, Belle Dubois, Cox's Orange Pippin, Ribston Pippin, and Bismarck apples; Emile d'Heyst, Beurré Rance, Beurré Hardy, Pitmaston Duchess, Directeur Alphand, Beurré Foqueray, Durondeau, Marie Benoist, and Conference pears; Nectarine, Gladstone, Sea Eagle, and Princess of Wales peaches. Altogether there were nearly one hundred dishes shown in this fine exhibit.

There were three competitors for the medals offered as prizes in the class for not less than thirty nor more than fifty distinct varieties of hardy fruit, in baskets or dishes, grown entirely in the open air. The exhibits were staged on a space twenty-four feet by three feet, and foliage plants were allowed to create effect. Here the chief award, a silver-gilt medal, was won by Mr. G. Mount, Rose Nurseries, Canterbury, who had an extremely pretty display set off by small ferns, palms, bamboos, crotons, and selaginella; the finest and most prominent fruits were Bismarck, Warner's King, Cox's Orange Pippin, Cellini, Peasgood's Nonsuch, Royal Jubilee, Gascoigne's Scarlet, and Worcester Pearmain apples, and Thompson's, Williams' Bon Chretien pears. Mr. Mount can grow apples and pears as well as he can roses, and that is saying a good deal. Mr. J. Colwill, All Saints' Road, Sidmouth, Devon, came second; and Mr. J. Basham, Bassaleg, Newport, third, the latter showing pears well.

The chief award for a collection of from thirty to thirty-six distinct varieties of pears, in baskets or dishes, all from the open air, and arranged in a space of twenty-four feet by three feet, was won by Mr. H. Berwick, Sidmouth Nurseries, Devon, with a very even set of fruit, his best samples being King Edward, Doyenne du Comice, Doyenne Boussoch, Williams' Bon Chretien, Beurré Clairgeau, Chaumontel, Glou Morceau, Hacon's Incomparable, and Beurré Bachelier. There was but one competitor.

Mr. J. Colvill, Sidmouth, Devon, led the way for a collection of fifty distinct varieties of apples, all grown in the open air; he had a splendid lot of fruit, and one of the best-coloured collections in the show; the specimens were also of good size, as a whole; Gascoigne's Scarlet, Vicar of Beighton, Sandringham, New Hawthornden, Red Beitigheimer, Twenty Ounce, Tyler's Kernel, Peasgood's Nonsuch, Duchess of Oldenburg, Lord Derby, Lady Sudeley, Jubilee, Wealthy, Washington, and Worcester Pearmain were all grandly represented; the second prize was secured by Mr. J. Basham, Bassaleg, Newport, Mon., who brought a splendid lot of fruit from South Wales, though some were spotted as if by hailstones; Bismarck, Egremont Russett, Alfriston, King of the Pippins, and Mabbott's Pearmain were very good; Messrs. Paul and Son, Cheshunt, won third prize.

There were two entries in the class for not less than seventy-five nor more than a hundred varieties of hardy fruit staged in dishes or baskets, and all grown in the open air. Foliage plants were allowed to decorate the table, and these were used in both instances. Messrs. G. Bunyard and Co., Maidstone, gained the gold medal offered as first prize, and secured it with a magnificent lot of fruit, chiefly apples, though pears, peaches, plums, nuts, and nectarines were staged. The centre of the table was occupied by a pyramid of scarlet apples, each face having a centre of yellow-skinned varieties. At the table corners were large mounds of Cellini, Lady Sudeley, Gascoigne's Scarlet, and Seaton House apples, each with a central palm and a fringe of panicum. There were baskets of handsome fruits of Warner's King, Duchess of Oldenburg, Lord Grosvenor, Bramley's Seedling, Mère de Ménage, The Queen, Bismarck, and other useful apples. Madame Treyve, Pitmaston Duchess (huge fruits), Doyenne Boussoch, Nouvelle Poiteau, Brockworth Park, Dr. Jules Guyot, Beurre Mortillet, Emile d'Heyst, Conference, and Marguerite Marillat were the best pears shown. For colour, size, and general excellence this exhibit was not surpassed in the show. Mr. H. Berwick won second prize with a tasteful display of useful and bright fruits.

GARDENERS AND AMATEURS ONLY.

A grand lot of apples staged by Mr. G. Woodward, gardener to R. Leigh, Esq., Barham Court, Maidstone, won first prize in the class for two dozen dishes, consisting of sixteen cooking and eight dessert varieties ; the fruits were of large size, clean. even sized, and brightly coloured ; the varieties were Belle Dubois, Mère de Ménage, Ecklinville, Peasgood's Nonsuch, Loddington, Emperor Alexander, Lord Derby, Grenadier, Twenty Ounce, Bismarck, Tower of Glamis, Northern Dumpling, Warner's King, Waltham Abbey Seedling, Alfriston, Belle Pontoise, American Mother, Cox's Orange Pippin, Wealthy, Ribston Pippin, Gascoigne's Scarlet, Washington, Worcester Pearmain, and Baumann's Red Winter Reinette. Mr. Woodward was the only exhibitor in this class, but he would have been hard to beat.

The competition in the class for a dozen dishes of apples, distinct, eight cooking and four dessert varieties, was better, there being six entries. The chief award was secured by Mr. B. Miller, gardener to F. W. Startup, Esq., West Farleigh, Maidstone, who showed handsome, well-coloured, and very clear specimens of Alfriston, Peasgood's Nonsuch, Ecklinville, Warner's King, Yorkshire Beauty, Tibbett's Incomparable, Spencer's Favourite, Grenadier, Baumann's Red Winter Reinette, Cox's Orange Pippin, Worcester Pearmain, and Ribston Pippin ; M. W. G. Pragnell, gardener to J. K. Digby, Esq., M P., Sherborne Castle, Dorset, came second, showing grand dishes of Peasgood's Nonsuch, King of the Pippins, and Mère de Ménage ; Mr. G. Chambers, Mereworth, Maidstone, third. Four competitors brought nine dishes of apples, six cooking and three dessert varieties, and here the first prize was won by Mr. J. Dawes, gardener to M. Biddulph, Esq., M.P., Ledbury Park, Ledbury, who scored with first-rate specimens of Warner's King, Ecklinville, Lord Suffield, Hollandbury, Beauty of Kent, Tyler's Kernel, Cox's Orange Pippin, Blenheim Pippin, and Ribston Pippin ; Mr. W. Slogrove, gardener to Mrs. Crawford, Gatton Park, Reigate, came second ; and Mr. T. W. Herbert, gardener to J. Charlesworth, Esq., Redhill, was third. There were five entries of six dishes of cooking apples, Mr. Woodward winning with very large and fine fruits of Lord Derby, Emperor Alexander, Peasgood's Nonsuch, Belle Dubois, Warner's King, and Loddington ; Mr. G. Lock, gardener to B. H. Hill, Esq., Newcombes, Crediton, Devon, gained second prize, but the judges wrote "too highly polished" across the award card. No less than eleven competitors came forward in the class for three dishes of cooking apples, so that there was a good display ; Mr. A. Maxin, gardener to Colonel H. Walpole, Heckfield Place, Winchfield, won first prize with Lady Henniker, Warner's King, and splendidly coloured Emperor Alexander ; Mr. J. Lee, Bebington, Cheshire, gained second prize. There were four exhibits of six dishes of dessert apples, the best being that staged by Mr. G. Woodward, Barham Court Gardens, who had even-sized, clean, and splendidly coloured fruits of Washington, Wealthy, Ribston Pippin, Worcester Pearmain, Cox's Orange Pippin, and American Mother : Mr. B. Miller, West Farleigh, came second, showing good Cox's Orange Pippin, and King of the Pippins. The beat three dishes of dessert apples consisted of King of the Pippins, American Mother, and Ribston Pippin, were shown by Mr. A. Pentney, gardener to A. J. Howard, Esq., Worton Hall, Isleworth ; there were thirteen competitors, and Mr. J. C. Tallack, Livermere Park Gardens, Bury St. Edmunds, won second place with King of the Pippins, Ribston Pippin, and Blenheim Pippin.

Out of three sets of twelve dishes of dessert pears staged, Mr. G. Woodward won chief honours with magnificent specimens of Marguerite Marillat, Beurre Mortillet, Pitmaston Duchesse, Triomphe de Vienne, Beurre Hardy, Durondeau, Doyenne du Comice, Doyenne de Merode, Duchesse d'Angouleme, Emile d'Heyst, Beurre Superfin, and Gansel's Bergamot ; the only complaint one can make is that some of the fruits were rather large for dessert, and would need to be carved ; Mr. W. Allan, gardener to Lord Suffield, Gunton Park, second ; and Mr. W. H. Bacon, gardener to Sir Marcus Samuel, Mote Park, Maidstone, came third.

The best nine dishes of pears, dessert varieties, came from Mr. W. G. Pragnell, Sherborne Castle Gardens, Dorset, his set consisting of Maréchal de la Cour, Marie Louise, Marguerite Marillat, Beurre Superfin, Beurre Bachelier, General Todtleben, Beurre Diel, Durondeau, and Pitmaston Duchess ; Mr. J. Powell, gardener to Colonel Brymer, M.P., Dorchester, second ; and Mr. W. Jones, gardener to J. P. Brougham, Esq., Carshalton, third.

Mr. G. H. Sage, gardener to the Marquis of Camden, Bayham Abbey, Lamberhurst, was first prize winner for six dishes of dessert pears, showing fine specimens of Williams' Bon Chretien, Souvenir du Congrès, and Pitmaston Duchess ; there were ten entries ; Mr. W. A. Cook, gardener to Major Heneage, M.P., Compton Bassett, Wilts., second. Mr. R. Edwards, gardener to G. H. Field, Esq., Beechy Lees, Sevenoaks, scored for three dishes of dessert pears, leading out of nine competitors ; Mr. G. Fennell, gardener to W. M. Cazallet, Esq., Tonbridge, second. For three dishes of cooking pears, Mr. Woodward came to the front with big specimens of Triomphe de Jodoigne, General Todtleben, and Catillac ; Mr. W. H Brown, second, out of seven sets.

There were no less than eleven sets of three dishes of peaches staged, and the competition was very keen. Mr. G. Woodward gained the leading honours with beautifully fresh fruits of Princess of Wales, Nectarine, and Sea Eagle ; Mr. A. Maxim, a good second ; and Mr. A. Pentney, third. The best single dish of peaches came from Mr. G. Wythes, Syon Gardens, Brentford, who had Sea Eagle, in fine condition ; Mr. T. Wren, second. Mr. Woodward was again to the fore in the class for nectarines, showing Rivers' Orange, Pine Apple, and Humboldt ; Mr. C. Earl, Somerhill, Tonbridge, second ; and Mr. A. Maxim, third. Mr. H. Redden, Manor House Gardens, West Wickham, scored for a single dish of nectarines with fine examples of Victoria ; a dish of fruits, apparently belonging to no one, gained second prize.

Figs were in the class specially provided for these fruits, limited to two dishes of Brown Turkey, shown by Mr. W. Mitchell and Mr. J. Jones, who were awarded the prizes in the order of their names.

The competition in the class for four dishes of dessert plums was very keen, no less than eleven competing, Mr. J. Vert, gardener to the Right Hon. Lord Braybrooke, Audley End, coming first with fine dishes of Transparent Gage, Coe's Violet, Jefferson's and Coe's Golden Drop ; Mr. W. King, Gatton Park Gardens, second. Mr. Vert won for a single dish of dessert plums with Coe's Golden Drop ; Mr. W. Pope, Highclere Castle Gardens, second, with Jefferson's, out of twenty-six entries. Mr. W. King had the best dish of gages, staging Rivers' Transparent. For four dishes of cooking plums the chief award was secured by Mr. W. Pope, with Grand Duke, Victoria, Monarch, and Pond's Seedling, all fine specimens ; Mr. J. Vert, second. Mr. W. Camm, gardener to the Duchess of Cleveland, led for one dish of cooking plums, with grand examples of White Magnum Bonum ; Mr. A. Andrews, Wickham, second, with Pond's Seedling. Mr. G. Fennell and Mr. W. J. Empson were first and second respectively for damsons.

DESSERT APPLES.—SINGLE DISHES.

There were eight entries in the class for Adams' Pearmain, the first prize going to Mr. P. Loch, gardener to B. H. Hill, Esq., Newcombes, Crediton, Devon ; and the second to Mr. W. Camm, gardener to her Grace the Duchess of Cleveland, Battle Abbey, Sussex. Mr. H. Henley, gardener to E. J. Johnstone, Esq., Roughdon Hall, Bury St. Edmunds, secured the premier award for Allen's Everlasting, in which class there were five entries. Mr. J. Powell, gardener to Colonel Brymer, M.P., Islington House, Dorchester, was second. The competition was good in the Allington Pippin class, the prizes being secured by Mr. G. Woodward, gardener to Roger Leigh, Esq., Barham Court, Maidstone, and Mr. J. Powell. Ten entries were to be found for Baumann's Red Winter Reinette, Mr. G. Woodward being first, and Mr. W. Slogrove, gardener to Mrs. Crawford, Gatton Cottage, Reigate, second. The Blenheim Pippin class evoked a fine competition, the sixteen entries being all of good quality. Mr. T. H. Slade, gardener to the Right Hon. Lord Poltimore, Poltimore Park, Exeter, securing the premier award, with Mr. R. M. Whiting, Credenhall, Hereford, an excellent second. Brownlee's Russett was well represented, the successful exhibitors being Mr. G. Chambers and Mr. Woodward. For Claygate Pearmain, Mr. Whiting and Mr. Woodward were first and second respectively. Nine dishes were staged of Cockle's Pippin, the awards going to Mr. P. Kidley, gardener to W. A. Sanford, Esq., Wynehead Court, Wellington, Somerset, and Mr. H. Henley, gardener to E. J. Johnstone, Esq., Rougham Hall, Bury St. Edmunds. Court Pendu Plât were nicely staged ; Mr. J. C. Tallach, gardener to E Dresden, Esq., Livermere Park, Bury St. Edmunds, being first, with a good dish of fruit ; and Mr. J. Vert, gardener to the Right Hon. Lord Braybrooke, Audley End, Saffron Walden, second. There were no less than twenty-five dishes of Cox's Orange Pippin staged, and the competition was extremely close. Mr. W. King, gardener to J. Colman, Esq., Gatton Park, Reigate, secured the premier award with some splendid fruit, whilst Mr. Woodward was a good second. Mr. G. Sage, gardener to the Marquis of Camden, Bayham Abbey, Lamberhurst, was first with a good dish of Duke of Devonshire ; the other prize going to Mr. H. C. Prinsep, gardener to Viscountess Portman, Buxted Park, Uckfield. Egremont Russet was of excellent quality, the premier award going to Mr. C Earl, gardener to O. E. d'Avigdor Goldsmid, Esq., Somerhill, Tonbridge ; and the other to Mr. Whiting. Mr. Stowers was first in the class for Fearn's Pippin, in which there were nine entries, and Mr. Loch was second. An excellent lot of Gascoigne's Scarlet were staged, the awards going to Mr. Stowers and Mr. Thomas. With an excellent dish of James Grieve, Mr. J. Day, gardener to the Earl of Galloway, K.G., Galloway House, Gordiestown, secured the first prize ; Mr. F. B. Parfitt, Farleigh House, Reading, being second. King of the Pippins was, of course, very well represented, Mr. Chambers and Mr. Prinsep, with fine dishes, securing the awards in the order named. Mr. Woodward, with a good dish of King of Tomkin's County, secured the premier award, with Mr. Powell a good second. For Mannington's Pearmain, Mr. Turton, and Mr. C. Harris, gardener to O. A. Smith, Esq., Hammerwood Lodge, East Grinstead, were first and second, with good dishes. No less than twelve dishes of Margil were staged, Mr. Woodward's splendid exhibit securing him the premier award, whilst Mr. Slade was a close second. Mr. Woodward was also first with American Mother, the other prize going to Mr. H. Henley, gardener to E. J. Johnston, Esq., Rougham Hall, Bury St. Edmunds. There were no less than sixteen entries in the class for Ribston Pippin, a fine dish placing Mr. Slade first, with Mr. Chopping second. Mr. Pragnell and Mr. R. Chamberlain, gardener to F. M. Lonergan, Esq., Cressingham Park, Reading, were the successful exhibitors in the class for Sturmer Pippins. Fourteen entries was the total for Worcester Pearmain, Mr. King, with an excellent exhibit, being first, and Mr. Woodward second. In the class for any other variety than those already given, there were no less than twenty-one entries, Mr. Woodward, with a very pretty dish of Mabbot's Pearmain, being first, and Mr. B. Miller, with St. Edmund's Pippin, second.

COOKING APPLES—SINGLE DISHES.

The classes in this division were, on the whole, well filled. Mr. G. Woodward was first in the Alfriston class, with Mr. J. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, W., second. Mr. Woodward was also first for Beauty of Kent, while Mr. Herrin, gardener to Lady Fortescue, Dropmore, Maidenhead, was second. There were eight entries in the Bismarck class, the fine dish shown by Mr. S. W. Sweet, Vredfort Villa, Tovell's Road, St. John's, Ipswich, securing him the premier award ; Mr. Woodward was second. In the Bramley's Seedling class there was a very spirited contest, the prizes going to Mr. W. Stowers, 10, Harold Road, Sittingbourne ; Mr. C. Ross, gardener to Captain Carstairs, Welford Park, Newbury ; and Mr. W. H. Bannister, gardener to H. St. Vincent Ames, Esq., Cote House, Westbury-on-Trym, in the order named. A very fine dish of Cellini secured Mr. Slade the premier award ; Mr. R. M. Whiting, Credenhill, Hereford, being second. Cox's Pomona was staged of very fine quality, the awards going in favour of Mr. Woodward and Mr. J. Powell, gardener to Colonel Brymer, M.P., Islington House, Dorchester. There were nine entries in the class for Dumelow's Seedling, Mr. G. Chambers, Mereworth, Maidstone, and Mr. W. H. Godden, gardener to F. W. Buxton, Esq., Pishiobury, Sawbridgeworth, being the successful exhibitors. Thirteen dishes of Ecklinville Seedling were staged and Mr. Woodward's fine fruit, gained him the first prize ; the second went to Mr. B. Miller, gardener to F. W. Startup, Esq., West Farleigh, Maidstone. Emperor Alexander was only represented by four dishes, but all were very good, Mr. Woodward and Mr. Stowers securing the awards. Mr. T. Turton, gardener to Mrs. G. Garden Nicol, Maiden Erleigh, Reading, was first with an excellent dish of Frogmore's Prolific, with Mr. A. Pentney, gardener to A. J. Howard, Esq., Worton Hall, Isleworth, second. Mr. Woodward showed a very fine dish of Golden Noble, which secured him the premier award ; the other prize went to Mr. Prinsep. Golden Spire was represented by five dishes, Mr. Woodward and Mr. Whiting being successful. Grenadier was very good, the fine dish shown by Mr. B. Miller, gardener to F. W. Startup, Esq., West Farleigh, Maidstone, putting him first, with Mr. Woodward second.

There were nine dishes of Hawthornden (new) staged, the prizes going to Mr. Woodward and Mr. Herbert, gardener to J. T. Charlesworth, Esq., Nutfield

Court, Redhill. In the class for Hormead's Pearmain, Mr. Woodward and Mr. Whiting were again first and second. Lane's Prince Albert was a fine class, there being eleven dishes staged and all of them of great merit. The first prize went to E. Chopping, Esq., Perriwinkle Mill, Milton, near Sittingbourne, and the second to Mr. Prinsep. A wonderfully fine dish of Lord Derby secured the premier award in this class, in which there were fifteen entries. Mr. A. Basile, gardener to the Rev. O. L. Powels, Woburn Park, Weybridge, being the other successful exhibitor. Mr. Herrin was first with a good lot of Lord Grosvenor, with Mr. Woodward second. Of the thirteen dishes of Lord Suffield staged, that shown by Mr. W. G. Pragnell, gardener to J. K. D. W. Digby, Esq., M.P., Sherborne Castle, Dorset, was adjudged the best, whilst that of Mr. W. Lewis, gardener to T. Oliverson. Esq., East Sutton Park, Maidstone, was awarded the second prize. Mère de Ménage was well staged, Mr. Woodward and Mr. Slade being first and second with fine dishes. Mr. C. Ross secured the premier award for New Northern Greeting, and Mr. G. Chambers was second. Mr. J. Bowery, gardener to H. H. Howard, Esq., Gurney Manor, Hingham, Norfolk, was first with a fine dish of Newton Wonder; Mr. M. J. Epson, gardener to Mrs. Wingfield, Ampthill House, Ampthill, securing the other award. This was in the class for northern counties, and in that for the southern counties. Mr. F. W. Thomas, Wannoch, Polegate, Sussex, was first, and Mr. Woodward second. Peasgood's Nonsuch was excellently staged, Mr. Woodward, with a fine dish, again being first, and Mr. Lewis second. Mr. Woodward was also first with Potts' Seedling, and Mr. J. Harris, gardener to P. Crowley, Esq., Waddon House, Croydon, was the other successful exhibitor. Four dishes of Royal Jubilee were staged, the awards being made in favour of Mr. Woodward and Mr. Ross. Mr. Ross was, however, first with a fine dish of Sandringham, with Mr. J. Howard, gardener to Sir R. Sutton, Bart., Benham Park, Newbury, second. Excellent dishes of Spencer's Favourite caused the awards to go in favour of Mr. Woodward and Mr. Mills, whilst in the class for Stirling Castle, in which there were ten entries, Mr. Ross was first and Mr. Whitney second; Mr. Ross was also the most successful exhibitor in the class for Stone's, with a fine dish; and Mr. Camm second.

Ten dishes of the Queen were staged, Mr. Woodward, with splendid fruits, seecuring the premier award, the other prize going to Mr. Miller. Again was Mr. Woodward first, this time with an excellent dish of Tower of Glamis, with Mr. Howard second. For Tyler's Kernel there were only two entries, the prizes going to Mr. Woodward and Mr. S. Lyon, gardener to R. R. Solomon, Esq., wton, Chester. The class for Warner's King evoked a spirited contest. Mr Woodward, with an excellent dish, was adjudged first of the fourteen competitors, with Mr. Chambers a good second. There were fifteen entries in the class for any other variety than those for which prizes were specially offered, Mr. Woodward securing the premier award with a splendid dish of Belle Dubois; Mr. W. Jones, gardener to J. R. Brougham, Esq., Wallington Bridge, Carshalton, with a fine dish of Dutch Codlin, was second.

Dessert Pears, Single Dishes.

In the class for Beurré Bosc, Mr. Howard secured the award; whilst for Beurré D'Anjou, Mr. Sage and Mr. J. Spottiswoode, The Gardens, Queen's Park, Brighton, were the successful exhibitors. There were eleven entries in the class for Beurré Diel, Mr. Pragnell, with a very fine dish, being first; and Mr. Wythes, gardener to Right Hon. Earl Percy, Syon House, Brentford, second. For Beurré Dumont, Mr. R. Potter, gardener to Sir Mark W. Collet, Bart., St. Clere, Kemsing, Sevenoaks, securing the premier award; and Mr. A. Basile was second. For Beurré Fouqueray, Mr. Woodward and Mr. Hudson were the successful exhibitors. The class for Beurré Hardy contained eight entries, of which the two best were adjudged to be those staged by Mr. Woodward and Mr. Prinsep. Mr. Woodward was also first in the class for Beurré Superfin; with Mr. H. J. Harvey, gardener to A. B. Sheridan, Esq., Frampton Court, Dorchester, a good second. Mr. W. Allan, ;gardener to Lord Suffield, Gunton Park, Norwich, was first for Comte de Lamy; with Mr. Herbert, gardener to J. T. Charlesworth, Esq., Nutfield Court, Redhill, second. Conference was represented by five dishes, of which the two best were adjudged to be those staged by Mr. Woodward and Mr. Thomas. For Conseiller the prizes went to Mr. Powell and Mr. Ross, who both staged fine dishes. An excellent exhibit of Doyenne du Comice secured Mr. Powell the premier award, the other prize going to Mr. Woodward. Durondeau was represented by seven dishes, the two awards going in favour of Mr. Woodward and Mr. Pragnell. Mr. Jones and Mr. Powell were first and second respectively for Easter Beurré, whilst for Emile D'Heyst the awards went to Mr. Woodward and Mr. G. Fennell, gardener to W. M. Cazalet, Esq., Fairlawn, Tonbridge. Mr. Prinsep was first with an excellent dish of Fondante d'Automne, with Mr. Powell a good second. For Fondante de Thirriott the prizes went to Mr. Woodward, and Mr. W. Child, gardener to F. M. Rendell, Esq., Shirley, Surrey; whilst for Glou Morceau, Mr. Woodward and Mr. Powell were the successful exhibitors. Mr. Powell was, however, first with a very fine dish of Josephine de Malines, with Mr. J. Fraser, gardener to F. L. Davies, Esq., Coldra Caerleon, Mon., second. For Le Lectier the prizes went to Mr. Jones and Mr. Basile in the order named. Mr. Camm, with a very good dish of Louise Bonne of Jersey, was first, and Mr. G. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, second. Mr. Woodward was first with a fine dish of Madame Treyve, the other prize going to Mr. R. Edwards, gardener to G. H. Field, Esq., Beechy Lees, Otford, Sevenoaks; whilst in the class for Marie Benoist the award was secured by Mr. W. H. Goddon, gardener to F. W. Buxton, Esq., Pishiobury, Sawbridgeworth. Mr. Allen was first for Marie Louise with a fine dish, and Mr. Pragnell was second; whilst for Marie Louise d'Uccle the prizes were secured by Mr. Allan and Mr. Webb, gardener to H. Padwick, Esq., Manor House, Horsham. For Marguerite Marrillat Mr. Woodward and Mr. Thomas were successful; whilst for Nouvelle Fulvie Mr. G. Wythes was first with a fine dish, Mr. Woodward being second. For Olivier de Serres the prizes were awarded to Mr. Harris and Mr. Woodward. Pitmaston Duchess was represented by no less than nineteen entries, Mr. Loch, with a magnificent dish, being first and Mr. Chamberlain second. For Seckle, Mr. Prinsep and Mr. Ross were successful; whilst for Souvenir de Congrès the prizes went to Mr. Herrin and Mr. Coleman Mr. Powell was first for Thompson's, with Mr. Allan a good second; whilst for Winter Nelis Mr. Bennett was first and Mr. Harris second. In the class for any other variety than those already given there were twenty entries, Mr. Woodward being first with a fine dish of Triomphe de Vienna; Mr. Hardesley, gardener to H. Partridge, Esq., Castle Hill, Bletchingley, second.

Our report of the divisions for market growers, the competition for the special district county prizes, and the contributions to the miscellaneous class will be given, with a complete audit of the fruit shown and illustrations of the more interesting objects, in our next issue.

Mr. A. Vince, late of Morants Court, Sevenoaks, has been appointed head gardener and bailiff to Lieut.-Colonel Dansey, at Cams Hall, Fareham, Hants.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

Disqualifications at Flower Shows.—Enquirer, Kent: Thanks for your communication. We shall be glad to receive a complete copy of the schedule of the exhibition in question before we can deal with the matter. If you have a list of the eleven sorts of vegetables by you we should be glad to have a copy.

Seedling Begonia.—W. A., Newcastle-on-Tyne: The variety is a good one, and the flowers very substantial and large. Such flowers could be obtained as a result of growing a first-class strain such as the leading specialists supply seed of. You are quite at liberty to show it at an exhibition, and, if the schedule demands a name, give it a local varietal one.

Figs.—C. M.: Whether grown in pots or planted out in well-drained borders figs will give an ample return. In consequence of the excessive luxuriance of figs, where they have unlimited root room in a rich border, pot culture has much to recommend it, and in planting in borders it is desirable to restrict the run of the roots by means of divisional walls.

Roses.—W. B. H., Sussex: The several phases of rose culture are so fully dealt with in the "Amateurs' Rose Book" that it will afford you all the information you will require for the successful cultivation of your favourites. The work is freely illustrated, and is published (price 3s. 6d.) by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.

Orchids.—F. Robinson: The "two best books" on orchids in the English language are unquestionably "Veitch's Manual of Orchidaceous Plant" (price £5) and "Williams' Orchid Growers' Manual" (price £1 5s.) These works are of great excellence, and are obtainable from Messrs. J. Veitch and Sons, King's Road, Chelsea, and Messrs. B. S. Williams and Son, Upper Holloway, respectively.

To Make Holes for Flower-pots.—G. L. P., Chichester: We know of no such tool as you ask about, and, considering the difference between the base and top diameters of a pot, such a contrivance would not easily be produced. Then also there would be difficulties in the way of providing for pots of different sizes, while the expense of such a machine would be considerable. Trowel and spade will do the work well enough in the hands of a good worker.

Fungus on Chrysanthemums.—W. A., Northampton: We advise you to remove all the worst affected leaves and sponge the remainder with sulphide of potassium solution. After this is done, spray the whole of the collection with a solution of sulphide of potassium, and repeat the operation every few days as long as circumstances necessitate or permit it. See p. 630 in the issue of September 24. We suggest also that you spray the carnations as a preventive.

British Ferns.—W. Smith: British ferns might be lifted and replanted before the fronds die down without injury, provided the work is done as quickly as possible, and they receive a liberal watering when in their new quarters. If the soil is dry, water thoroughly several hours before lifting the plants. The most suitable time for replanting ferns growing on rockeries or in the open borders is just before they commence to make new growth in the spring, or when they have completed their first growth in the summer.

Hydrangea paniculata.—C. R., Highgate: There should be no difficulty in having Hydrangea paniculata in flower by the end of June or in July, for it is frequently shown in full bloom at the Temple show in May. It is advisable to obtain sturdy plants in pots, as these will respond better to a little encouragement than lifted stools. Winter them in cold frames and give them a start in a peach house or vinery, removing them to suitable quarters, when the leafage at all obstructs the light. Keep as near the glass as possible, so as to prevent undue elongation of growth, and as the season advances afford plenty of air; weak liquid manure may be applied at intervals, and, of course, a little more or a little less warmth can be accorded, as the case may be, to ensure flowering at the right date. This plant requires long and gentle encouragement to flower before its usual time, rather than great heat and moisture, indeed, these spell failure.

Failure of Nectarine Tree.—E. Y., Norwich: The failure is due to a fungoid attack upon the roots, and it appears that the roots were somewhat lacerated at planting time, and thus allowed the fungus to spread. The inherent vitality of the tree, assisted by the few new roots that formed and the reserve food stored in the plant tissues, served to tide the tree over the first year and enable it to carry a small crop of fruit. The strain of ripening the crop, together with the spread of the fungoid attack along the principal roots, crippling the fibres, led to the final collapse. Clear out all the soil that surrounded the plant and burn it, so that no mycelium be left to propagate the fungus; add new material before planting again, and in this mix some lime rubble, mortar rubbish, or similar material. See also that the roots of the new plant you will presently obtain are not damaged; if bruised or torn, cut them back to the healthy portion, and make the cut from beneath.

Names of Plants.—W. L., Romford: The white flower is Swainsonia galegifolia; and the variegated plant is Hibiscus rosa-senensis var Cooperi. We cannot undertake the naming of florists' flowers.

R. M., Barton-on-Irwell: We do not recognise the plant from the meagre description given.

A. H. B., Plymouth: 1, Ophiopogon Jaburan variegatus; 2, Anthericum variegatum; 3, Acalypha Macafeeana; 4, Galega officinalls albiflora.

W. R., Whittlesea: 1, Polygonum cuspidatum; 2, Trachelium cœruleum.

Names of Fruits.—R. H., Yorkshire: The samples were poor ones, as a whole; the number of specimens was exceeded, and neither name nor address was sent. This is scarcely fair to us, but we have done our best for you. 1, Keswick Codlin; 2, Gold Medal; 3, Withington Fillbasket; 4, Yorkshire Beauty; 5 and 12, Crimson Costard; 8, Lord Burleigh; 9, Crimson Quoining; 10, Waltham Abbey Seedling; 11, Irish Peach.

E.C.K., Douglas, Isle of Man: 1, Stoke Edith Pippin; 2, not recognised. If you can send us another specimen when the season is a little more advanced, we will again endeavour to identify it.

G.L. and S., Malton: The variety is probably a local seedling, and seems to be intermediate between Calville St. Saviour and Catshead.

L.W., Hitchen: 1, Lord Derby; 2, Kerry Pippin; 3, Queen Caroline; 4, Loddington; 5, Mère de Ménage.

S.S.J., Merton: 1, Beurre Bosc; 2, Ecklinville; 3, Gravenstein.

D.F., Derby: 1, Court Pendu Plât; 2, Adams' Pearmain; 3, Alfriston; 4, New Hawthornden.

M.J.C, Abergele: 1, Catshead; 2, Mère de Ménage; 3, Warner's King, 4, Lane's Prince Albert.

G. T., Guildford: 1, Keswick Codlin; 2, Lord Grosvenor; 3, not recognised; 4, Allen's Everlasting.

NATIONAL CHRYSANTHEMUM SOCIETY.

A FLORAL Committee meeting of the above society was held at the Royal Aquarium on September 26, the meeting was a small one. Among the most notable exhibits was the early flowering chrysanthemum, Norbet Puvrez, a rich coppery-red flower, rather small, but very pretty and extremely free and very dwarf; it was shown by Mr. J. H. Witty, Nunhead Cemetery. Yellow Queen, a sport from Queen of the Earlies, was sent by Mr. G. Thurssell, Goff's Oak, Cheshunt, and this the committee desired to see again. Crimson Pride, a rich crimson variety, with fairly large flowers, was certificated for its earliness and value for cutting; it is in the way of Mons. Menier, but evidently earlier, and with less gold on the reverse of the florets; this was shown by Mr. Wells, Earlswood, who also sent a bunch of Henri Yvon, a pretty buff and rose variety, a sport from M. Gustave Grunerwald. Soliel d'October, a good early exhibition Japanese variety, shown by Mr. H. J. Jones, Ryecroft Nursery, Lewisham, occasioned a good deal of comment, and only lost a certificate by one vote; the petals are long and drooping, soft yellow, with pale straw yellow reverse.

Some new tubes for cut blooms were shown by Mr. J. Pinches, Haymarket, but they did not meet the approval of the committee, neither did the tube shown by Mr. Burgin, St. Neot's, which was a rather complicated article. By means of additional extension tubes, Mr. Pinche's arrangement could be used so as to raise a flower fully eighteen inches all over the show board, and thus display to the full those forms with long drooping segments.

MR. JAMES MITCHELL, for the past four years general foreman at Castle Bar, has been appointed gardener to Sir Charles Barrington, Bart., Glenstal Castle, Muroe, Co. Limerick.

REAPING AND SOWING are the two most important periods in the life of the farmer, and granting that all circumstances are favourable, he naturally, during the latter period, hopes to get an adequate return for his labour. As he sows, he expects to reap, and unless constant industry has been exercised, the harvest is generally a poor one. So it is with regard to health, if we are not constantly on the watch and destroy the germs of disease as soon as they are discerned, the body becomes weakened, and at last is unable longer to resist the attacks of the enemy. Holloway's Pills destroy even the most minute traces of disease, by purifying the blood and strengthening the system.—[ADVT.]

MARKETS.

Covent Garden.

THERE are fairly good supplies of fruit and vegetables, and these sell at moderate prices. There is a slight improvement in trade generally, as holidays are now fast concluding. The cut flower trade is also brighter.

FRUIT.—English apples, 3s. to 7s. 6d. per bushel; English grapes, 10d. to 2s.; Jersey, 6d. to 9d. per lb.; Denia, 5s. to 7s. 6d. per barrel; English pears, 3s. to 6s. 6d. per bushel; French, 3s. to 5s. 6d. per case; Victoria plums, 2s. to 3s. 6d.; Orleans, 2s. to 3s.; Pond's seedlings, 2s. 6d. to 4s.; damsons, 2s. to 3s. per half-sieve; green figs, 9d. to 1s. 6d.; peaches, 1s. 6d. to 6s.; nectarines, 2s. to 8s. per dozen; cobnuts, 35s. to 45s.; filberts, 30s. to 35s. per 100 lb.; English tomatos, 4d. to 5d.; Jersey, 3d. per lb.; pineapples, 2s. to 5s. each; bananas, 5s. to 10s. per bunch; Spanish melons, 5s. to 7s. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 2s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 3s to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 1s. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; Sweet Sultan, 1s. to 2s.; pelargoniums (scarlet), 3s. to 5s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Endive, 1s. 3d. to 1s. 6d.; cucumbers, 2s. to 4s.; cauliflowers, 1s. 3d. to 2s. per dozen; turnips, 2s. 6d. to 3s. 6d.; carrots, 2s. to 3s.; parsley, 2s. to 2s. 6d.; mint, 2s. to 2s. 6d.; leeks, 2s. per dozen; vegetable marrows, 3s. 6d. to 6s. 6d.; cabbages, 3s. to 5s.; beetroots, 2s. to 3s. per tally; Valencia onions, 5s. to 6s. 6d.; Ports, 5s. 6d. to 6s. 6d. per case; mushrooms, 5s. to 8s.; eschallots, 1s. 3d. to 1s. 9d. per 12 lb.; celery, 10s. to 15s. per dozen rolls; scarlet beans, 2s. 6d. to 4s. per bushel; potatos, 50s. to 90s. per ton.

Borough Potato Market.

There is a good average demand for the season, and a fair supply to meet it. Prices are practically the same as last advised. Beauty of Hebron and Snowdrops, 3s. 6d. to 4s.; White Hebrons, Early Puritan, Sutton's Early Regents, Reading Giants, and Imperators, 3s. to 3s. 6d.; Black Lands, 2s. 6d. to 2s. 9d.

THE WEATHER DURING THE WEEK ENDING SEPTEMBER 24, 1898.

The mean reading of the Barometer during the week at Greenwich was 29·94 inches, and that of the Thermometer 57°·2, the latter being 1°·4 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 16 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 33·8 hours. The measured rainfall amounted to 0·12 of an inch.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, OCTOBER 4.—Scottish Horticultural Association.

WEDNESDAY, OCTOBER 5.—United Horticultural Benefit and Provident Society: Annual Dinner at the Holborn Restaurant at 6.30 p.m.; chair to be taken by Mr. George Bunyard, V.M.H.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY, OCTOBER 3, 4, 5, 6, AND 7.—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

WEDNESDAY, OCTOBER 5.—Azalea Indica, Azalea Mollis, Rhododendrons, Camellias, Stove and Greenhouse Ferns, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

WEDNESDAY AND THURSDAY, OCTOBER 5 AND 6.—Nursery Stock, Messrs. Protheroe and Morris, Tunbridge Wells Nurseries.

FRIDAY, OCTOBER 7.—Imported and Established Orchids, Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

NEARLY EVERY DAY—Dutch Bulbs, Mr. J. C. Stevens, King Street, Covent Garden.

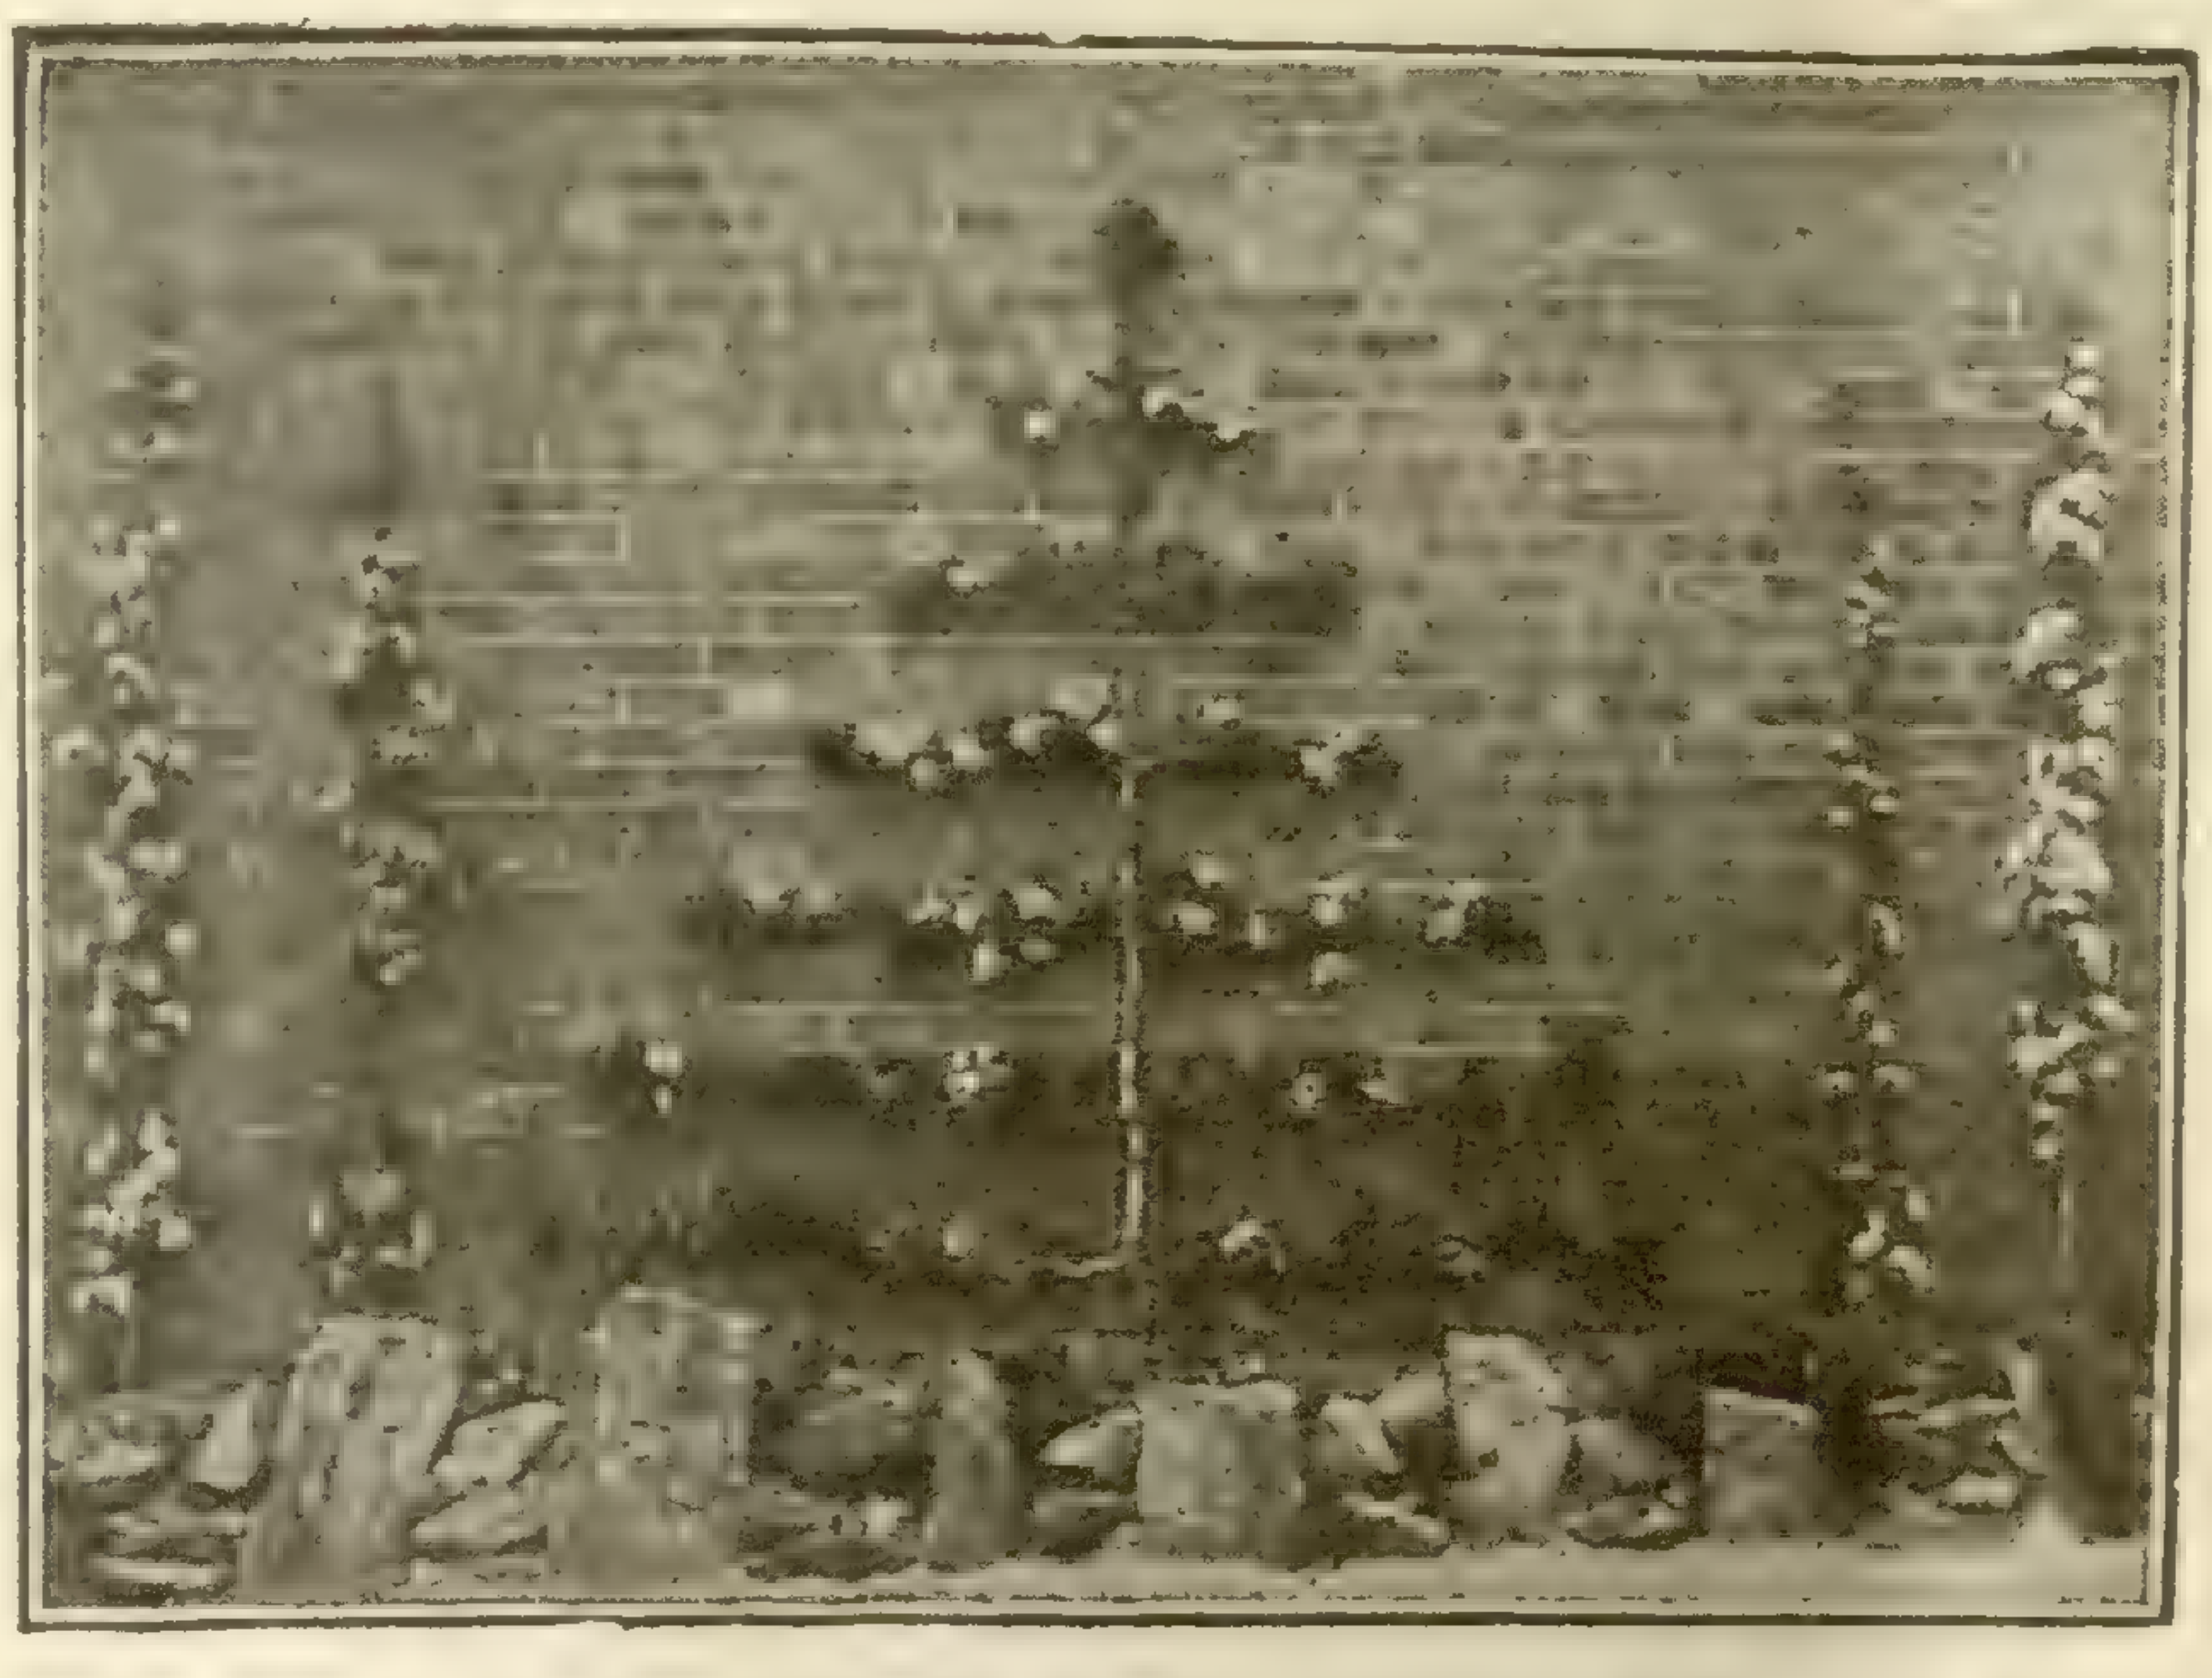
THOSE having Houses to Let or Sell, or Apartments to Let, whether in town or country, should send an advertisement to the "CITY PRESS." The paper is acknowledged by all to be one of the best mediums for this purpose. Prepaid terms: 32 words, One Shilling; three times for [illegible]. Offices 143 and 149 Aldersgate Street London,

AN AGE OF SPECIALISTS.

20,000 Trained Trees to Select from!
50,000 Apples on Paradise!

For considerably over a century our firm has been noted for the careful cultivation of Fruit Trees, and has built up a reputation by sending out Trees **TRUE TO NAME.** During the past Sixteen Years we have greatly **extended our culture of Fruit Trees,** and, having given up the cultivation of all General Nursery Stock in favour of these, and Roses, we may fairly claim to be **Fruit Tree Specialists.** To-day we are pushing the matter still closer, and make a Speciality (without neglecting other branches of Fruit Tree Culture) of



Photograph from Customer, of Trees planted the previous Autumn.

ESPALIER TRAINED TREES.

Last Season we had a **Stock of over 20,000,** a stock which for excellence or number we believe to be without parallel. We have **Apples, Pears,** and **Plums** trained in this form. **Peaches, Nectarines, Apricots, Cherries,** &c., as fan-trained Trees. We were the first to grow **Plums** as horizontally trained Trees, a method which suits them infinitely better than any other.

DESCRIPTIVE CATALOGUE, with article on Planting, Pruning &c., 6d.; Gratis to Customers.

CONTRACTORS TO H.M. BOARD OF WORKS, H.M. ADMIRALTY, WAR OFFICE, &c.

ALL who contemplate Erecting Glasshouses should send for M. and Co.'s NEW COPYRIGHT CATALOGUE (1897 issue), 128 pages. A COMPLETE GUIDE to the Erection of Conservatories, Vineries, Orchid Houses, Peach Houses, Plant Houses, &c., with Prices of Fittings, including Boilers, Stages, Ventilating Tackle, and all accessories. Post free on application.

Gentlemen waited upon, and Surveys made on payment of out-of-pocket expenses.

ESTIMATES FREE FOR ALL KINDS OF HORTICULTURAL BUILDINGS, WITH MOST RECENT IMPROVEMENTS.

HOUSES SUPPLIED IN TEAK WOOD WHEN REQUIRED.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

NOTES OF THE WEEK.

PACKING FRUIT FOR MARKET.

ONE of the most important of the questions relating to the production of fruit for commercial purposes is unquestionably the determination of the methods of packing, by which the several kinds can be placed upon the market inexpensively, in the best possible condition, and in a form to attract the attention of purchasers. Hence the action of the Council of the Royal Horticultural Society in offering prizes for competition among growers for market for examples of packing of the chief kinds of fruit is deserving of the warmest commendation. If the results were not on the whole so satisfactory as could have been wished, the Council were in no way to blame. They provided numerous classes with prizes sufficiently liberal to ensure a considerable number of entries, and they were careful to select as judges experts conversant with the ways of the markets. Whether it was wise to limit the judges in the packing classes to market growers and salesmen, is a question that is open to discussion, and we are of the opinion that it would have been better to have included an expert wholly free from market traditions. However that may be, the contributions to the section open to market growers formed one of the most interesting of the features of that great gathering, for in it were represented both good and bad methods, and the awards afforded evidence of the difficulty some men have of breaking with old practices, however objectionable they may be. In the classes for grapes there was nothing new in the methods of packing; but, as it was stipulated, in three of the four classes that the grapes were to be shown in a single layer in a "baby basket," there was not much scope for originality. In the fourth class, for "any other package," the premier award was made to grapes packed in a cross-handled basket, and as grapes so packed may be sent long distances by post or rail without the slightest injury, provided the bunches are firmly secured to the sides, this method appears to be difficult of improvement. Plums and damsons were packed in the old-fashioned round basket, and with reference to them it will suffice to say that it is matter for regret that the value of inexpensive, non-returnable boxes, such as are so largely used by Belgian and French growers for sending their produce to this country, is not appreciated by growers at home. Happily there were some innovations in the methods of packing apples and pears, and Mr. Basham's basket of Ecklinville Seedling apples and Mr. Wyatt's box of Durondeau pears, of which illustrations are given on another page, represent distinct improvements. Mr. Basham's was one of the four baskets for which he was awarded the first prize for four varieties, and the only possible objection that could be raised to this system of packing is the cost of the baskets, rendering it necessary to return them. The fruit, which had undergone a long journey, was without a blemish, and the cost of the wood wool used in packing each basket, Mr. Basham assured us, did not exceed one penny. It would be interesting to know whether inexpensive boxes could not be substituted for baskets, that by reason of their cost, must be returned, and we shall be obliged if Mr. Basham will give his views upon this point. Mr. Wyatt's pears were packed in a shallow box with pink tissue paper between them, and no better method of sending these fruits to market or to purchasers resident some distance from the source of supply could well be devised. The four varieties of dessert apples and the "any one variety" of dessert and cooking apples were packed in round baskets, and it was distressing to see the first prize in each of the two classes for single varieties awarded to baskets in which the fruit was heaped up some five or six inches above the edge. The baskets were, in fact, so packed that they could not have been placed one above the other in a van or railway truck without the fruit being much damaged, as the weight of the baskets above would have to be sustained by the fruit instead of the sides of the baskets. This system of packing is only adapted for sending a few baskets to a contiguous market, and for this reason it is much to be regretted that the judges should have shown a preference to it, and made awards that must retard rather than hasten the reforms so necessary in methods of marketing fruit.

DETAIL IN NATURE.

THE comparison of a wasp's sting with the point of the finest needle is well known as exemplifying the marvellous finish which characterises the work of Nature on the one hand, and on the other the rudeness of man's handiwork when viewed by a powerful lens. The one loses all its polish under such scrutiny, and is seen to be bluntly ended and roughly surfaced, while the other betrays absolutely no defects, and reveals more and more perfection the higher the magnifying power which is brought to bear. So it is throughout Nature, wear and tear may damage the finished article, so that the butterfly's wing may here and there be devoid of feathers, or the originally perfect flower may display defective petals, but these are always accidentals. Take the butterfly just emerged from the chrysalis, or the flower from the bud, and the more we can pry into the details of their construction the more we are astounded by the finish which pervades them. Mere size goes for nothing; the zoologist may take the elephant, and dissecting it display to our wondering gaze the marvels of anatomical, muscular and nervous organisation which go to constitute that hugest of beasts; he may even go further, and giving us microscopic sections of bone and tissue, open up another realm of structural and functional marvels; but the entomologist will take one of the tiniest insects and do as much, and more, for in many cases there are metamorphoses in insect life which have no parallel in that of animals. A fly of any sort lives two distinct lives, each with utterly different organisations, and each one fraught with its own particular marvels of detail. The breathing apparatus of a caterpillar, for instance, and that of the subsequent butterfly, are as different as it is possible to imagine, while anyone who has seen the plumage of the latter would at once admit that the peacock itself was surpassed in splendour of detail and colouring, unless he had seen beforehand that every filament in that bird's plumage was an equal marvel. So it is with plants, every hair, every cell, nay, every granule of chlorophyll within those cells, are beautifully and wonderfully made, and perfectly finished off. There is no scamping or patchwork in Nature's creations, from the smallest to the largest, each one is a masterpiece, and size is merely the upheaping of minute perfections. A yard long cattle horn may seem a clumsy article, but slice off a section anywhere, and its innate beauty of structure comes to light; the elephantine tusk, the roughly corrugated tooth of the horse, the gnarled trunk of a tree, one and all need but dissection to display the same perfection internally. The roughness is due to wear and tear, or, it may be, to vital purposeful need, but never to defective work that is a thing unknown. It is, however, the marvellous details of the very minute which strikes the investigator with the greatest force. Among the diatoms, for instance, we find the transparent flinty skeletons of very low forms of vegetable life to be absolutely invisible to the naked eye, and yet to resemble the most ornate cut-glass work imaginable. Thousands of different specific types exist, and a tiny patch of mud collected from the nearest pond may yield a million of these crystal wonders, each one of which would yet be a miracle of complete and perfect workmanship, though fashioned by a microscopic blot of seemingly inanimate jelly.

POLISHING FRUIT.

THE truth enunciated by Shakespeare, more than three centuries ago, that "to paint the lily," or "to throw a perfume on the violet," is "wasteful and ridiculous excess," does not appear to be fully appreciated by some of the present-day cultivators of fruit, and we, in consequence, have at the autumn exhibitions evidence of attempts to improve upon Nature. More especially has this evidence been forthcoming at the exhibitions of British grown fruit held at the Crystal Palace under the auspices of the Royal Horticultural Society, and the Council may be heartily congratulated on their endeavour at the recent gathering to put a stop to the practice of polishing fruit staged in competition for the prizes. This is no new practice, as conclusively shown by the fact that at least fifteen years ago we made a vigorous protest against the use of the oiled rag in the preparation of fruit for exhibition. We have a lively recollection of a chrysanthemum show in one of the suburbs of the metropolis at which the apples and some of the pears were so liberally oiled that the oil could be readily seen about the eye and stalk, and made the fruits most offensive to handle. At the previous exhibition the judges had unwittingly given the premier awards to fruit that had been polished, and the other exhibitors, taking note of the advantage that had resulted from the procedure, used the oil so freely as to arrest the attention of the judges, and to bring about, to them, disastrous results, for every dish that had been oiled was properly disqualified. Of late years a more refined system of polishing has been adopted, and for a considerable period cream was used instead of oil. Cream has in its turn been superseded, and according to a statement made by the Rev. W. Wilks, when addressing the judges upon this question, the favourite materials for polishing are a soft rag and saliva, and anything more objectionable than the latter it is impossible to conceive. Not one of the forty judges questioned the statement; but they all appeared to have acted upon the instructions given them, that while they should not disqualify the polished fruit, they should take some points from it; for we found numerous collections occupying a considerably lower place in the competition than they would have done had the fruit been shown without having been subjected to a polishing process. Let us hope that the somewhat severe lesson administered on the occasion of the Royal Horticultural Society exhibition will be taken to heart by exhibitors generally, and that judges at provincial shows will follow the lead of the experts to whom was entrusted the task of making the awards at the Crystal Palace. To our minds no fruit is so attractive as when in its natural state, and apples and the smooth-skinned pears are no exception to the rule, and to give them an artificial gloss with the aid of oil, cream, or saliva, and a soft cloth, "makes," to again quote from Shakespeare, "sound opinion sick and truth suspected."

Conference on Chrysanthemum Rust.—As announced in the GARDENERS' MAGAZINE of the 1st inst., the executive committee of the National Chrysanthemum Society, has, in view of the devastation being wrought among chrysanthemum plants by the action of the Chrysanthemum Rust, arranged to hold a conference in St. Stephen's Hall, Royal Aquarium, on the evening of Tuesday next, at six oclock, to which the members of the society and all interested in the matter are invited. Mr. T. W. Sanders, chairman of the committee, will preside, and the programme includes a paper to be read by Mr. P. Waterer. vice-chairman of the committee, on "The Practical Aspects of the Chrysanthemum Rust;" and one by Mr. G. Massee, Royal Gardens, Kew, on "The Scientific Aspect of the Chrysanthemum Rust." At the close of the reading of the papers time will be allowed for discussion.

Nitrogenous Manures in Potato Culture.—The influence of nitrogenous manures on the potato crop has been very clearly demonstrated in the course of the experiments conducted at Rothamsted during the past twenty-three years, and the results obtained are of much interest. It is of considerable importance to cultivators to know that the plots receiving farmyard manure, containing about 200 lb. of nitrogen, gave less produce than the mixture of mineral manure and ammonium salts, or nitrate of soda, supplying only 86 lb. of nitrogen. This is explained by the fact that only a small proportion of the nitrogen of farmyard manure is quickly available, that due to undigested matter being more slowly available, and that in the litter remaining a long time inactive. Farmyard manure is, however, often applied in very large quantities for potatos, the process being to a great extent one of forcing, and there remains a great amount of unexhausted manure-residue within the soil. The percentage of nitrogen in potato tubers is much increased by the application of nitrogenous manures, but the less so the riper the crop. Without manure there is a comparatively low percentage of mineral matter and a medium percentage of nitrogen. With mineral manure alone there is the highest percentage of mineral matter, and the lowest of nitrogen. With purely nitrogenous manures there is the lowest percentage of mineral matter, and the highest of nitrogen. Lastly, with mineral and nitrogenous manures together, there are intermediate percentages, both of mineral matter and of nitrogen, in the tubers. More than 80 per cent. of the total nitrogen of the tubers exist in the juice. A comparatively small but variable proportion of the nitrogen of the tubers exists as albuminoids in the solid portion; perhaps on the average only about 15 per cent.; while from 40 to 50 per cent. of the total nitrogen may exist as soluble albuminoids in the juice, so that about or nearly two-thirds of the total nitrogen may exist as albuminoids, by far the larger proportion being, however, in the juice. The non-albuminoid nitrogenous matter exists chiefly as amides. The characteristic effect of nitrogenous manures, provided there be a sufficient available supply of ash-constituents, and especially of potash, is to increase the amount of the non-nitrogenous substance—starch, in the tubers. Thus, the produce of starch per acre was about 1,100 lb. without manure, nearly 2,000 lb. with purely mineral manure, and with nitrogenous and mineral manures together about 3,400 lb., or about 1½ tons. In other words, the increased product of starch by the use of the mineral and nitrogenous manures together was more than one ton per acre. That is, there was a great increase in the production of the non-nitrogenous constituent—starch—by the use of nitrogen in manure, just as there is an increase in the produce of the non-nitrogenous constituent—sugar—by the use of nitrogenous manures to root crops. The increased production of non-nitrogenous substances by nitrogenous manures, is equally striking in cereal crops; the result in their case being an increased production of starch in the grain, and of cellulose in the straw. Indeed, it is for the production of the non-nitrogenous substances—starch, sugar, and cellulose—that our direct nitrogenous manures are chiefly used.

The Robert Hogg Memorial Medal.—After the death of Dr. Robert Hogg, a movement was set on foot to obtain subscriptions from those who valued this eminent pomologist's services, to obtain a medal to be given for meritorious exhibits in hardy fruits. The necessary amount was collected, and Mr. Harry J. Veitch and the Rev. H. H. D'ombrain were appointed to make the necessary arrangements. A suitable die has been obtained, and placed in the hands of the Ccuncil of the Royal Horticultural Society, who will issue the medals at their discretion, as in the case of the Banksian and other medals. The medal was awarded for the first time at the exhibition of British Grown fruit, held under the auspices of the society, the recipients being Messrs. G. Bunyard and Co., Messrs. T. Rivers and Son, and Messrs. J. Veitch and Sons. The first-named firm received the medal as the premier award in the class for a collection of hardy fruits not exceeding one hundred dishes, while Messrs. Veitch and Rivers were awarded the medal for their contributions to the non-competitive class.

The French Grape Harvest is well advanced in the south-east, considerable progress has been made in the Bordeaux district, and a beginning has been made in the Champagne. The record of a grape harvest is necessarily much influenced by the meteorological conditions that obtain during the summer; sunshine and shower, which at their own respective seasons are each an all-important factor in the production of good wine, seem in turn to have shed their benign influences on the grape-growing districts of France generally. Under the head of weather, as affecting this year's vintage, several points of interest are to be noted. The mild winter of 1897-98 was succeeded by a spring which, although cold and dry, was singularly free from the frosts so justly dreaded by vineyard proprietors. In April the healthy condition of the vines suggested hopes, further encouraged by the genial warmth that made its appearance with the commencement of summer—hopes which have since been realised owing to the continuance of the fine weather culminating in the record "September summer" experienced France as in England. The year 1898 may be pronounced one of exceeding dryness, practically no rain having fallen since the flowering of the vines in June—a fact confirmed by the rain gauge of Chateau Loudenne, which shows that the rainfall recorded during the ninty days following the flowering, a period generally accepted as fixing approximately the date of the vintage in the Médoc, has only amounted to one inch. As a consequence of this drought, the healthy condition of the vines and their entire freedom from the onslaughts of insect pests, presage the produce of 1898 in the Bordeaux as almost certain to be of excellent quality, while the quantity will be considerably increased by the timely showers of the last few days. The wood of the vines, moreover, is so well seasoned that it promises, under pruning, to start well equipped for the campaign of 1899. A curious fact in connexion with this year's grape harvest has been remarked by those who rejoice in coincidences. For the last fifty years those which terminate with the figure 8—viz., '48, '58, '68, '78, and '88—have all produced clarets of excellent quality, and it seems, therefore, but fair to conjecture this year that 1898 will follow the example set by its predecessors having the same terminal figure.

Bulbs for the London Parks.—The order for the bulbs required for planting in the parks and gardens under the control of the London County Council has this year been given to a Dutch firm, and this purchase has naturally given rise to considerable indignation on the part of those interested in commercial horticulture, which forms such an important industry of the United Kingdom. Mr. J. R. King, the well-known seedsman, writes in reference to the matter: "I am much surprised to find that the London County Council has placed the order for bulbs required for planting the London parks with a Dutch firm. I consider that no words are strong enough to condemn such a piece of injustice, and I venture to hope that the matter will not be allowed to drop. It is certainly open to question whether or not tenders from Dutch houses should have been invited at all. Our splendid London parks are English in their character and use. English money has provided them, English taxes support them, and English enterprise should be used to beautify them. To allow foreign tenders to be pitted against, and to be accepted in preference to, those of English houses is one of those strange characteristics of the dealings of public bodies which it is difficult to understand. The Dutch grower pays no rent, rates, nor taxes to this country, while the English seedsman is not only heavily taxed, but has to bear his share in providing the money required by the London County Council, who, in return, prefer to place their orders with foreign houses. I believe this is the first time the order for bulbs has been placed abroad, and, that it may be the last, I hope every pressure will be brought to bear on the responsible committee of the London County Council, not merely to give a satisfactory explanation, but to prevent the repetition of such an injustice to English seedsmen."

Royal Horticultural Society.—The Fruit, Floral, and Orchid Committees will meet at the Drill Hall, on Tuesday next, at noon; and at the afternoon meeting of Fellows the Rev. G. Henslow will lecture on "Some of the Plants Exhibited."

Experimental Stations were discussed in a paper read by Mr. Lewis Castle, manager of the Woburn Experimental Fruit Farm, at the meeting of the Birmingham Gardeners' Association, held at the Athletic Institute on Monday last. The subject was dealt with at some length; the experimental work in Great Britain and abroad was reviewed, and suggestions made for the formation and management of horticultural stations. Mr. W. Latham, curator of the Birmingham Botanic Gardens, presided, and at the close of a long and interesting discussion, a hearty vote of thanks was accorded Mr. Castle for his lecture.

The Fruits of the Passion Flower suffer so much in transit, unless packed with exceptional care, that hitherto it has been found impossible to import them from abroad, and it would appear that the problem of their successful importation still awaits solution. The latest consignment of these fruits to this country arrived a few days since by the "Orient," but the fruit contained in the twenty cases was in such an unsatisfactory condition as to necessitate the whole of it being condemned. Further attempts are, however, likely to be made in order to get this particular kind of fruit placed on the market, as it is thought that when the fruit is once introduced a profitable trade may be cultivated. In appearance the Passion fruit somewhat resembles the walnut. The fruit is of a yellow colour, and the flavour is nearly similar to that of a black currant. In the colonies, where there is a good demand for the product, it is frequently eaten with sugar and cream. Mr. S. Low, of the firm of Messrs. W. Weddel and Co., 16, St. Helen's Place, has been appointed by the New South Wales Government to report on the condition of the shipment, and when seen by a representative of the *City Press* he pointed out that the present consignment had not been packed in the best manner possible, and that the temperature of the compartments in which it had been carried had been far too high. Consequently, he said, more than an ordinary amount of delay occurred. Mr. Low thinks that in the future a very large business will be done in the fruit of Passiflora edulis, but in his opinion the trade might best be opened up by sending a few cases to a private merchant, who would distribute it among the best class of fruiterers. The fruit could thus be introduced to the public, and a demand would, he says, no doubt, soon be created.

American Fruit Crop.—The September report of the Department of Agriculture at Washington contains much information of interest relating to the American fruit crop. The apple crop does not appear to be very satisfactory, and the downward movement in the general condition of the apple crop has continued, only four States—Georgia, Iowa, Minnesota, and Idaho—reporting any improvement upon the condition in the preceding month. Three States return the September condition above 100: these are Idaho, 115; Minnesota, 105; Wisconsin, 104. At the other extreme are such values as 18 for Indiana, 20 for Ohio, 20 for Nebraska, and 25 for Missouri. In the New England States the average condition ranges between 75 and 51, whilst in New York it is only 33, and in New Jersey 38. Of peaches about two-thirds of a full crop is looked for, but there is great local variation. Georgia, the leading peach-growing State of the Union, is fortunate in returning an average as high as 108. On the other hand, Texas at 46 and Arkansas at 38, these ranking probably as second and third of the peach-producing States, have less than half a crop each. Along the Atlantic slope, from New York to Virginia inclusive, from 10 to 49 per cent. of a full crop is indicated. The condition of the grape crop is regarded as very satisfactory.

Horticultural Club.—The first dinner and conversazione of the session 1898-99, will take place on Tuesday next at six p.m. The subject for discussion will be "The Fruit Crop of 1898 and its Lessons," to be opened by Mr. George Bunyard, V.M.H.

Protectively-coloured Mice.—The common house mouse did not escape the notice of the scientists assembled at Bristol, for Dr. H. Lyster Jameson exhibited examples of a race of protectively-coloured mice which inhabit a sandy island in the Bay of Dublin, known as the North Bull. A considerable percentage of the examples are distinctly lighter in colour than the ancestral type of house mouse, though every possible intergradation occurs between the typical house mouse and the palest examples. Dr. Jameson regards the marked predominance of sand-coloured examples as due to the action of natural selection. The hawks and owls which frequent the island, and are the only enemies the mice have to compete against, most easily capture the darkest examples, that is to say, those that contrast most strongly with the colour of the sand, and thus a protectively-coloured race is becoming established. A reference to old charts and Parliamentary papers has shown that this island first came into existence about a century ago, and consequently it is possible to fix a time limit within which the race in question has been evolved. Professor Poulton emphasised the value of these time data as being an additional proof of the statement made by the president in his opening address that the transmutation of species is not necessarily so slow as to be indiscernible.

Some Crested Begonia Blooms of great excellence have been sent us from Aberlour, Strathspey, by Mr. J. G. White, who states that the plants bearing them were raised from seed sown this year. In the Strathspey district begonias, both single and double, have flowered profusely, but unfortunately two frosts occurred last week, one of four and the other of seven degrees, which effectually ended the outside display. Mr. White is to be congratulated upon his success as a begonia grower, for the trusses and flowers before us are large and substantial, bright, clean, and fresh even after their long journey. There are buff, pink, salmon, apricot, and crimson forms all fringed in a much more regular and bold manner than any we have hitherto seen.

Sweet, Seville, and Bergamotte Oranges.—The Sweet orange, which is also known as the Chinese or Portugal orange, is the fruit of Citrus aurantium, a small, much-branched tree of about twenty feet in height, which is scarcely known at the present time in a wild state, but which seems to have been originally a native of Northern India or Southern China, and not introduced into Europe till the middle of the fifteenth century, at least, so says Mr. J. R. Jackson, A.L.S., in *Knowledge*. At the present time the Sweet orange is cultivated very extensively in many parts of the Mediterranean district, as well as in Spain, Portugal, Madeira, the Azores, and many other countries possessing a suitable climate. In the South of Europe the trees flower in April and May, and the fruits ripen about a year after. A very large number of varieties of the orange have been described, the most important being those affecting the size, form, or quality of the fruit. The more important varieties are those known as the China orange, the St. Michaels, the Blood or Malta, in which the pulp and juice are of a blood-red colour, the Mandarin, and Tangerine. Orange trees are remarkably prolific fruit bearers, and it has been stated on good authority that one tree has been known to yield twenty thousand fruits fit for exportation. Enormous quantities of fruits, which are ever increasing in bulk, find their way into the English market, and when it is borne in mind that each fruit has to be gathered separately, wrapped in paper and packed, together with the cost of the boxes, freight and labour throughout, and after all this the fruits can often be sold in the retail market at twenty for a shilling, it seems very remarkable that the crops are made to pay even for the ground upon which they are grown. The orange is one of the most wholesome fruits known, and a truly valuable refrigerant, and it is remarkable that very few people dislike the orange. Besides the use of the pulp as an edible, the rind of the fruit, known as Sweet orange peel, is valued for its aromatic, stimulant, and slightly tonic properties.

Essential Oils from Oranges.—The essential oil, contained in such large quantities in the glands of the rind of the Sweet orange, is extracted both by the sponge and ecuelle processes. Large quantities of oil of orange peel are used in Germany in the preparation of perfumes and liqueurs. From the flowers a volatile oil is distilled, known as oil of neroli, which is one of the ingredients in Eau de Cologne, and is also used in perfumery and liqueurs. Besides this, the leaves and young shoots of the orange plant yield by distillation another kind of oil known as Essence de petit grain. The bitter or Seville orange, which is a variety of the last named, is rather a smaller tree, and does not seem to be cultivated in India except in gardens, but it is extensively grown in the same countries as the Sweet orange. The chief distinction is that the rind of the fruit has a bitter aromatic taste. It is used in making candied orange peel. The flowers are also used in distilling for oil of neroli. This variety, which is now classified as Citrus aurantium, var. Bigaradia, was at one time considered a distinct species under the name of C. vulgaris. The Bergamotte orange is another variety (C. aurantium, var. Bergamia). Its chief distinctions from the Sweet orange are its smaller flowers, which are known by their delicate and peculiar odour, and the paler colour of the fruit. The Bergamotte orange is grown chiefly near Reggio, in Southern Calabria, and more sparingly in Sicily, Southern France, and elsewhere. The volatile oil obtained from the rind of the fruit forms the Essence of Bergamo of the chemist, the principal use of which is in perfumery, while from the pulp is obtained, by expression, the acid juice which forms a portion of the commercial lime-juice.

A Practical Gardener on Bird Destruction.—In reply to a letter by Colonel Lautour, which appeared in the *Morning Post*, in condemnation of the steps that are being taken with a view to the preservation of useful birds, Mr. R. Maher, head gardener at Yattenden House, Newbury, writes: "You did me the honour to publish my plea on behalf of the birds, and likewise a letter on the other side of the question from Colonel Latour, who seems to think that the preservation of our British birds is a whim of a certain class of faddists. Of that class I am one, and at same time a practical gardener of forty years' experience. The last eighteen years I have had charge of large gardens practically in a wood swarming with birds. My bread and cheese, as it were, depend on a full supply of fresh flowers and vegetables, and yet the birds and I get on very well together. Of course, gardening, including fruit and vegetable culture, is essentially a matter of dressing and keeping, and where birds are numerous netting must be provided for bush fruits and strawberries. Speaking from a practical gardener's point of view, the only bird I consider it necessary to destroy is the bullfinch, for its bud-destroying propensities, and even the bullfinch during part of the year lives on weed seeds, such as docks, charlock, &c. The worthy Colonel seems to be afraid of foreign competition, but if British produce had as free access to the markets of Paris as French produce has to those of London that bugbear would soon disappear. If the French would admit our choice products, such as hothouse grapes, choice dessert apples, and pears, duty free, as we admit their produce, we need not kill our blackbirds and thrushes on that score. A short time since a good trade was springing up in France for British hothouse grapes; it was displacing the native produce by reason of its superiority, when a heavy duty was placed on the grapes, and of course the trade collapsed."

NOTES FROM IRELAND.

THE strawberry crop turned out excellent, even beyond our expectations, and thanks to the fine and sunny weather the flavour was all that could be desired. Red, white, and black currants were an unusually good crop. Cherries were an absolute failure. Gooseberries were an enormous crop of fine berries. Pears are well nigh a failure. Apples are somewhat uneven, some trees being heavily laden, while others have but a few fruit; the crop, however, will be an average one. Raspberries have borne a very heavy crop. In other parts of Ireland from here to Cork, I notice apples are everywhere a very heavy crop, notably on old trees in orchards. Plums, as far as my observations go, are a very light crop everywhere. This is also the report I have of the fruit crop over a widely scattered district. So far this has been one of the best years for potatos I remember. Early varieties have yielded a magnificent crop, and the quality is of the highest order after cooking. Ashleaf's turned out a really splendid crop, reminding one of a crop of Magnum Bonum. My old favourite, Early Puritan, has excelled all previous records; and this is unquestionably the potato for the cottager, being a splendid cropper and of superb cooking quality. Peas and beans have cropped well, and appear to have been in no way affected by the dry season. Autumn-sown onions are this year a very indifferent crop, while the spring-sown varieties are the worst I have ever had. Tomatos on outside walls are carrying a very fine crop of fruit, and providing we do not have a wet autumn, they should ripen thoroughly. During the past fortnight the weather has been very showery, and mushrooms, which are generally very abundant in this locality, have proved a very disappointing crop. Wasps are very abundant this year, and as a proof that fruit is scarce here, I may add that they have eaten the few solitary pears we had, although they were as hard as stones; to-day I notice they are eating the carrots in the ground.

Carnations have been satisfactory this season, while I do not remember seeing roses so good anywhere as they have been here this year. Chrysanthemums are very promising; the wood is firm, owing to the plants being dwarfer this year than usual. Montbretia crocosmiæflora is a glorious sight now. I have never seen it so good as it is this year; not a bulb has missed flowering, while some have as many as four spikes. The secret of successful cultivation of this bulbous plant is to transplant at least every second year. Plant them singly, just like gladioli, and the result will surprise anyone who has not tried it. If allowed to form large clumps they carry only a few spikes of bloom on the margin of the clumps, which are very poor compared with what they are when regularly transplanted. Some growers consider the montbretia to be only half hardy. This is an erroneous idea, here, at any rate, for they are perfectly hardy throughout Ireland. Even, when required for pots, the bulbs are best planted out, lifted, and potted when coming into flower. If well watered directly after potting they never exhibit the least symptom of distress. I have this season formed golden opinions of the dwarf antirrhinums for bedding. Some large beds of the crimson, white, and yellow varieties which I pass frequently have been a mass of flower ever since the end of June. They form one of the prettiest features in a very attractive garden. On the rockery autumn crocuses and cyclamen are making a good display. Various tritomas, phloxes, anemones, a fine selection of asters, with an endless variety of gladioli, are the principal features in the herbaceous borders now. Roses are flowering exceptionally freely this autumn, and dahlias, too, are making a fine display. Among liliums, auratum and its varieties are simply magnificent, as these do exceptionally well on this gravelly soil. Olearia Haasti has everywhere flowered splendidly this year. It is a pity this beautiful shrub is not more generally grown, as it appears to do well everywhere. Its compact habit is a great point in its favour.

Crotanstown Gardens. R. WELLER.

OUR NATIVE PLANTS NEAR THE SEA.

THOSE who reside near, or make frequent visits to the sea coast in the more remote parts of the country, must often have observed the manner in which one class of plants is situated in one particular place, and another class will hold its own but a short distance off, and yet neither will unduly encroach upon the other, although soil and general surroundings are in both cases very similar. I have been much interested this season by noting the manner and rapidity in which certain species of plants have spread over a considerable area of sea sand, from which they have drawn sufficient nourishment to sustain them in vigorous health, as though they had the best of cultivated soil in which to grow. The position referred to is at the head of a small inlet from off the Wigtown Bay, which is, as it were, let into the pleasure grounds of Galloway House, as these surround the greater part of it. This is well protected by a lofty headland from the fierce Atlantic gales, and tree and shrub life thrive luxuriantly to within a few feet of high water mark. At the highest and most sheltered part of this inlet, or bay, is a stretch of sand some five hundred yards in length, by twenty in breadth, most of which has been thrown up by the sea in former ages, but which, with the exception of occasionally very high tides, or violent storms, is not covered with salt water, even for short periods at the present day.

This bed of sand, especially the higher portion of it where it merges with terra firma, has become the home of many of our native plants, some of which are very seldom met with. One of these is the thorn apple (*Datura Stramonium*), which has been known here for several years, but until the present season it has not been seen in great numbers, yet, owing probably to some favourable event having occurred in connexion with the distribution of last year's seed, it is more numerous now than ever before. When fully developed, the plant is about two feet in height, double this in breadth, and presents a nearly flat surface of very dark green foliage, from which the white tubular flowers protude in a very effective manner. The plant commences to flower when only a few inches high, from the point of the shoot. As soon as the first flower is formed, two shoots spring from its base, and these in turn produce flowers, and the branching process is again repeated, so that a matured plant will generally present a good many blooms, with seed-pods, in various stages of growth, down to the ripening seed. The seed capsules are quadruple in form, and are covered with very strong spines, greatly resembling chestnut burrs. As the seeds ripen these open, showing the great quantities of seed contained within. The plant is fibrous rooted, and although it supports such a quantity of foliage, it penetrates but a short distance below the surface, and may be very easily detached from the sand. Though thriving so well in sea sand, it cannot withstand actual contact with sea water, as, when this occurs, its utter collapse is only the matter of a few hours. This plant should make a useful subject for subtropical gardening or bedding out, as the foliage is freely produced, and handsome in appearance, and closely resembles that of the solanums, so often used for the purpose.

Another quaint, if not beautiful, plant growing at the same place is the Henbane (*Hyocyamus niger*). The arched branches of this are about three feet in length, and are furnished with a double row of leaves, which droop gracefully on either side, while along the back or upper side of the branches are two rows of the peculiar coloured flowers, which are succeeded by the seed capsules, standing erect along the whole length of the branches, and are fitted with the cap-like arrangement, which, when ripe, is easily removed with the point of a knife, disclosing vast quantities of seeds.

The common Teazel (*Dipsacus sylvestris*) is fairly well represented, but it does not increase to the same extent as the plants already mentioned, which is doubtless owing to the ripened flower heads being cut for arranging with sedges and other lasting flowers in the winter season.

Verbascum thapsus, the common Mullein, has also become well established on the higher ground, and, judging by the rate it has increased during the past year or two, it will soon be very prominent. At one particular place the four species named formed a charming picture of Nature's handiwork. In the front row were the Thorn Apples, showing great numbers of blooms, well raised above the luxuriant foliage; behind these the Henbane was spreading its long branches in all directions; while the Teazels and Mulleins reared their stately spikes of bloom against a background of beech, pine, and other trees, which gave a very effective setting to the whole. JAMES DAY.

Galloway House, Garliestown, Wigtownshire.

HARDY FRUIT AREA.

I QUITE agree with you in reference to the extension of the fruit area, and I feel that the authorities had better let well alone, though the well may be far removed from exactness. There are few things so truly hateful to the rural mind as statistics, or any change in the methods of collecting them. By some means or other hardly does a parish or Government official appear with note book and pencil than the nightmare of a bigger rate or new tax troubles the agricultural mind. Hence in practice new schedules may secure no more reliable data than old ones. Growers have become used to the latter, and it will require years to help them to take kindly to the former. And meanwhile most growers are dead against official returns or other figures in their special business. Only those most familiar with the mysteries of rural life—such as growers, fruit merchants, jam factors, horticultural teachers or lecturers—can have any true idea of the horror and suspicion of figures that so generally prevails. Unless Major Craigie and other heads of departments are gifted with great patience and prudence, our newest schedules of fruit returns may readily become more illusionary than the first. Neither do all the mistakes arise from a prejudice or aversion to exact or, indeed, any returns. Some of them, as your extract from Major Craigie shows, are more or less inherent to the nature of the case. He says the use of the new schedules has brought to light in somewhat numerous instances cases where the older entries necessitated a careful inquiry, which showed that there had been in some places in former years a failure of the occupier in dealing with the classes of fruit properly included under this head, and that errors were made in the measurement of the small fruit areas lying within orchards and gardens, but occupied at the same time by fruit-bearing bushes. But this is a merit of modern cropping on which much of the success of modern fruit growing depends rather than on faults of scheduling, and the more crops we can run abreast on the same ground the better or the more profitable. Just now, when market gardening is being made a special branch of farming, and many small farmers and allotment holders are devoting special energy, skill, capital, and larger areas to market gardening, it seems almost a national misfortune that the acreage of our market gardens should have been dropped or discontinued. Possibly the mixed cropping, which is one of the chief merits of the system, proved the chief difficulty here also. Certainly, it must not be too hastily assumed that these market gardens have ceased to exist or to pay because they have dropped out of our national returns. On the contrary, their areas are widening, and their produce and profits growing in volume and quality day by day. And market gardens need multiplying at least tenfold before our toiling millions can have enough and to spare of our most luscious fruits, nutritious foods, and most fragrant flowers. The distinction, again, between orchard and garden produce has always been more or less capricious and uncertain, especially our head fruit (such as apples, pears, plums, and cherries) and ground fruit (such as gooseberries, currants, raspberries, intercropped again with strawberries, lettuces, &c.) And so long as we crop and feed the earth, as we do to-day under our express and multiple systems of cropping, so as to leave the residuum of fertility in favour of the soil, we shall go on reaping a maximum of food from minimum areas, schedule them as we may. Practical experts in culture and in special knowledge might also be able to afford useful information in the art of scheduling produce, so as to avoid omission or overlapping, and make our returns in these classes more reliable records of facts, while interfering as little as possible with the freedom or prejudices of growers, which no officials can ignore with impunity. D. T. F.

The Missouri Apple Crop of 1897 was estimated as worth twelve million dollars, but the crop this season is estimated at a much less value, although the fruit growers are quite satisfied with their prospects.

CHRYSANTHEMUMS.

NEWS OF VARIOUS COLLECTIONS AND GOOD PROSPECTS.

I HAVE lately taken a gardener's holiday, which means that occasionally a day or a few hours have been spent in rushing off to see other people's gardens. There is much satisfaction in this form of recreation, because we are bound to find something to "make a note of," and often, too, lose a little of our conceit by finding that we do not monopolise all the good things, or perhaps, occasionally, get something in the way of consolation when we happen to observe that other people have the same difficulties to overcome and experience the same reverses in cultivation as ourselves. Best of all, however, if we approach our neighbours with open minds, we not only find out some of our weak spots but also the ways and means to cure them.

Knowing how interested chrysanthemum growers are in the prospects of the season generally, I have made notes of a few collections which may be acceptable to readers, and judging from what I have seen, which, however, is entirely in the southern counties, we may reasonably look forward to a very successful season. The past hot weather has been ideally favourable to the plants, and complaints of unripened growth can hardly be possible. Watering has been a heavy item in the labour pertaining to their good cultivation, and consequently opportunities for supplies of liquid manure, without the risk of encouraging a too gross leafage, have been frequent. The possibilities of damping of the flowers is much less when growth is made under the influence of hot sunshine than that of showery seasons. One drawback, however, which may be present with some growers is where early buds have been secured the chances are in favour of their becoming too hard and refusing to open so well, or of such satisfactory form as would be the case in more moist weather. This early bud selection is a mistake, generally speaking, as I have before pointed out, and the only assistance that can be offered to such plants is to stand them where they will be shaded through the hottest part of the day, not under trees, but on the north side of a wall or building. There is also the chance of early buds dying off when little larger than peas; this usually results from over-feeding. When the plant has finished growing, supplies of manure should be much less frequent until the blossoms begin to unfold, otherwise injury to, if not the total loss of the bud is probable.

In the course of one of my visits I saw the famous collection of plants grown by Messrs. Cannell at Swanley; a regular grove of healthy stock, numbering some thousands, were neatly arranged in a fine open position here. Mr. Cannell's grower must have had some tender knuckles if he has used them to rap the pots of this huge batch of plants. That they have been well and carefully tended there is no doubt, and the Swanley flowers will tell a good tale in due season of the labour and thought bestowed on them; but of these more may be said another time.

From Swanley to Bromley, with the help of the useful bicycle, is not a long journey, and the opportunity of seeing the well-kept garden at Elmstead Grange, which is under the charge of Mr. J. Blackburn, was well worth the run. Everything is well kept here, and in first-rate order. How much neatness and methodical management enhance the good effect of high cultivation is strikingly shown in these gardens. The chrysanthemums are examples of the skill of an old hand, a collection where each plant bears inspection, and promises to yield a good result for the care evidently bestowed on it. Blooms from this place have materially helped in past seasons to win for Bromley the N.C.S. trophy for affiliated societies, and have also scored many successes in various other contests. It is to a certain extent remarkable that, even amongst the best cultivators, there is more or less a distinctive appearance about the plants, an individuality, as it were, pervading the whole, which in some cases makes it difficult to recognise certain varieties from their habit and foliage as compared with one's own. A few buds in this collection appeared to be developing rather rapidly, and may be past before the November shows, but the majority are well timed.

In the same locality, Mr. Weeks, the enthusiastic secretary of the Bromley Society, showed me what a very busy amateur can do in spare half-hours. Some fifty plants are grown at the back of his place of business, and a few more in his private garden, and really good they are; in fact, one sees many large gardens where these plants are not so well done. Many, if only they take a real liking for flowers, would find that the thorough cultivation, as a hobby, of one or two things, rather than attempting too much, yields the greatest pleasure, and I am sure they would be surprised as well as gratified at the success they could command. The chrysanthemum is one of the best plants for such growers, not only because it is easily grown, but best of all because it blooms during the autumn and winter, and lasts such a long time in beauty.

In our own neighbourhood the best plants are grown by Mr. Page at Chase Side House, Enfield. Though the collection is small, not more than two hundred and fifty plants being the limit, they are decidedly first-rate. Most of the cream of last season's novelties are included; healthy plants and buds (this latter one of the points which prove the cultivator best) are there of such promising sorts as Madame A. Rosseau, Souvenir de Madame E. Rosette, Mdlle. L. Zede, Sec Fierens, Mary Molyneux, Lady Isabel, Georgina Pitcher; and of the well-known varieties, the same excellent "timing" is naturally in evidence. Mr. Page looks forward hopefully, as he may well do; it is his first season in Enfield, but not so with chrysanthemums, as some of his flowers grown at another place were sent over to Ghent with the deputation from the N.C.S in 1897, his Madame Carnot being one of the finest shown.

On another journey I had the great pleasure of an afternoon at Aldenham House Gardens, where, as everyone knows, chrysanthemums have a real home. The plants here are most promising, quite a picture of health, and so good that Mr. Beckett must surely be satisfied. Many varieties are grown in nine-inch pots, and knowing how experienced a grower Mr. Beckett is, one cannot question the practice, as results have satisfied him long ago of its value. We ourselves, as readers will know, prefer a size larger pot, excepting for a few sorts, but probably the difference in the soil used at Aldenham and our own (the former being much richer) brings the value of the rooting medium about equal. Some robust seedlings are on trial, one or two are of an exceptionally dwarf habit amongst these, and had buds which should give large flowers, and we may hope good colours too, for of the old ones several are much too tall, and on this score must give place to any improvements in habit, providing the flowers are up to the same standard.

Both incurved and Japanese sections are well represented; of the former most growers will be more interested in the Queen's. These are fine plants, and the buds all taken about August 25 to August 30. Princesses were nice buds of earlier dates, taken about August 15, and were swelling away most kindly. The new Lucie Faure, Madame Ferlat, Duchess of Fife, Emile Nonin, and Mrs. Egan look well, and exhibit in their strong growth their close affinity to Japanese types.

Of the new Japanese, very fine-looking plants and dwarf in habit, are Georgina Pitcher, Chatsworth, President Nonin, Surpasse Amiral, and Belle of Castlewood; at the same time the hazel appearance of the stems and tinted leaves show that the hot sunshine has matured the growth, which is a condition essential to the development of sound blossoms. A batch of bush-grown plants were principally of late varieties for giving supplies of cut flowers through December onwards. Many-branched and clean-grown stuff that will be invaluable at midwinter.

The neat, well-arranged, and perfectly kept tone which pervades the whole of these extensive gardens is evident in every detail of the chrysanthemum culture, plainly suggesting to every observant visitor the fact that only by strict attention to small matters can such results be achieved. There are not many Aldenhams it is true, because there are not many such princely gentlemen who really love gardening as does its noble owner, but equally true also, because there are so few Becketts.

Trent Park Gardens. W. H. LEES.

DWARF KIDNEY BEANS.

ALTHOUGH a trial of dwarf kidney beans was conducted at Chiswick very recently, yet it seems needful to keep pace with the new ones so rapidly introduced that yet another trial should be made next year. These beans constitute one of the vegetables that can be well done outdoors in the Royal Horticultural Society's gardens. But whilst with so many of these beans there seems to be very little distinction in plant or pod, or even in cropping quality, there is undoubted distinction in colour and form of seed, and although to the grower that point may be of small moment, yet does it serve to satisfy that there is between them actual distinctness.

I have been making a small trial of these beans in two places this season. But whilst the one was a comparative failure, because the site and soil were so very cold in the early summer, in the other case the growth was excellent, and the crop highly satisfactory. One of these varieties was a white-seeded form, having also white flowers that were borne in prominent racemes above the leafage. This is an early, dwarf, very free cropping variety, and I have it under the name of Everbearing. It does not seem to be in common cultivation. Such well-known varieties as Negro Long Pod—though in this case it was not the true long-seeded selection I used to have at Bedfont—and Ne Plus Ultra, the ripe seeds from a dry sand being quite golden in colour, are difficult to beat as dwarf, free-cropping varieties and early. It is no matter for surprise that these continue to be so much in request in gardens. My latest to crop and ripen was Canadian Wonder, yet one of the very finest and best of all the section, and likely to hold its high position for many years. Another very full bearer is Sutton's Magnum Bonum. This in appearance and growth very much resembles Canadian Wonder, but the seeds are rather large, white, and have an edge of rich colour on the eye side. Sutton's Perfection is also a good mid-season bean, cropping heavily, the seed reddish speckled.

I had also the old Mohawk, not very easy to obtain in commerce now. The seeds of this variety are also speckled red, and it seems to be an excellent one. Two or three varieties or selections of late come from the Mohawk. Very striking amongst the new sorts are the fine ones raised by Mr. J. Smythe, Basing Park, Hants. One named Goliath is a strong grower, carries very long fleshy pods, and has seeds black in colour and long. The other is like a dwarf scarlet runner, for the flowers are scarlet, being borne on long racemes well above the leaves, and the seeds, though smaller, resemble those of scarlet runners. Both of these have been obtained by intercrossing the scarlet runner and Canadian Wonder.

But there are, old and new, so many varieties, distinct, or assumed to be, in commerce, that a thorough good trial of all should have exceeding interest. To enable full justice to be done to each variety the seeds of the earlier and dwarfer varieties should be sown fully six inches apart, and those of the stronger growers quite nine inches apart. Hence very few seeds would be needed to sow a row of some twelve to fifteen feet. Some dry seeds of every variety should be kept for inspection, and every effort should be made to bring all the varieties or stocks, which seem from the colour of the seeds to be similar, closer together. When that is done efforts at comparison are so materially helped. I hope these suggestions will be acted upon in the proper quarter when the Chiswick trials for next year are arranged. A. D.

THE CHRYSANTHEMUM RUST.

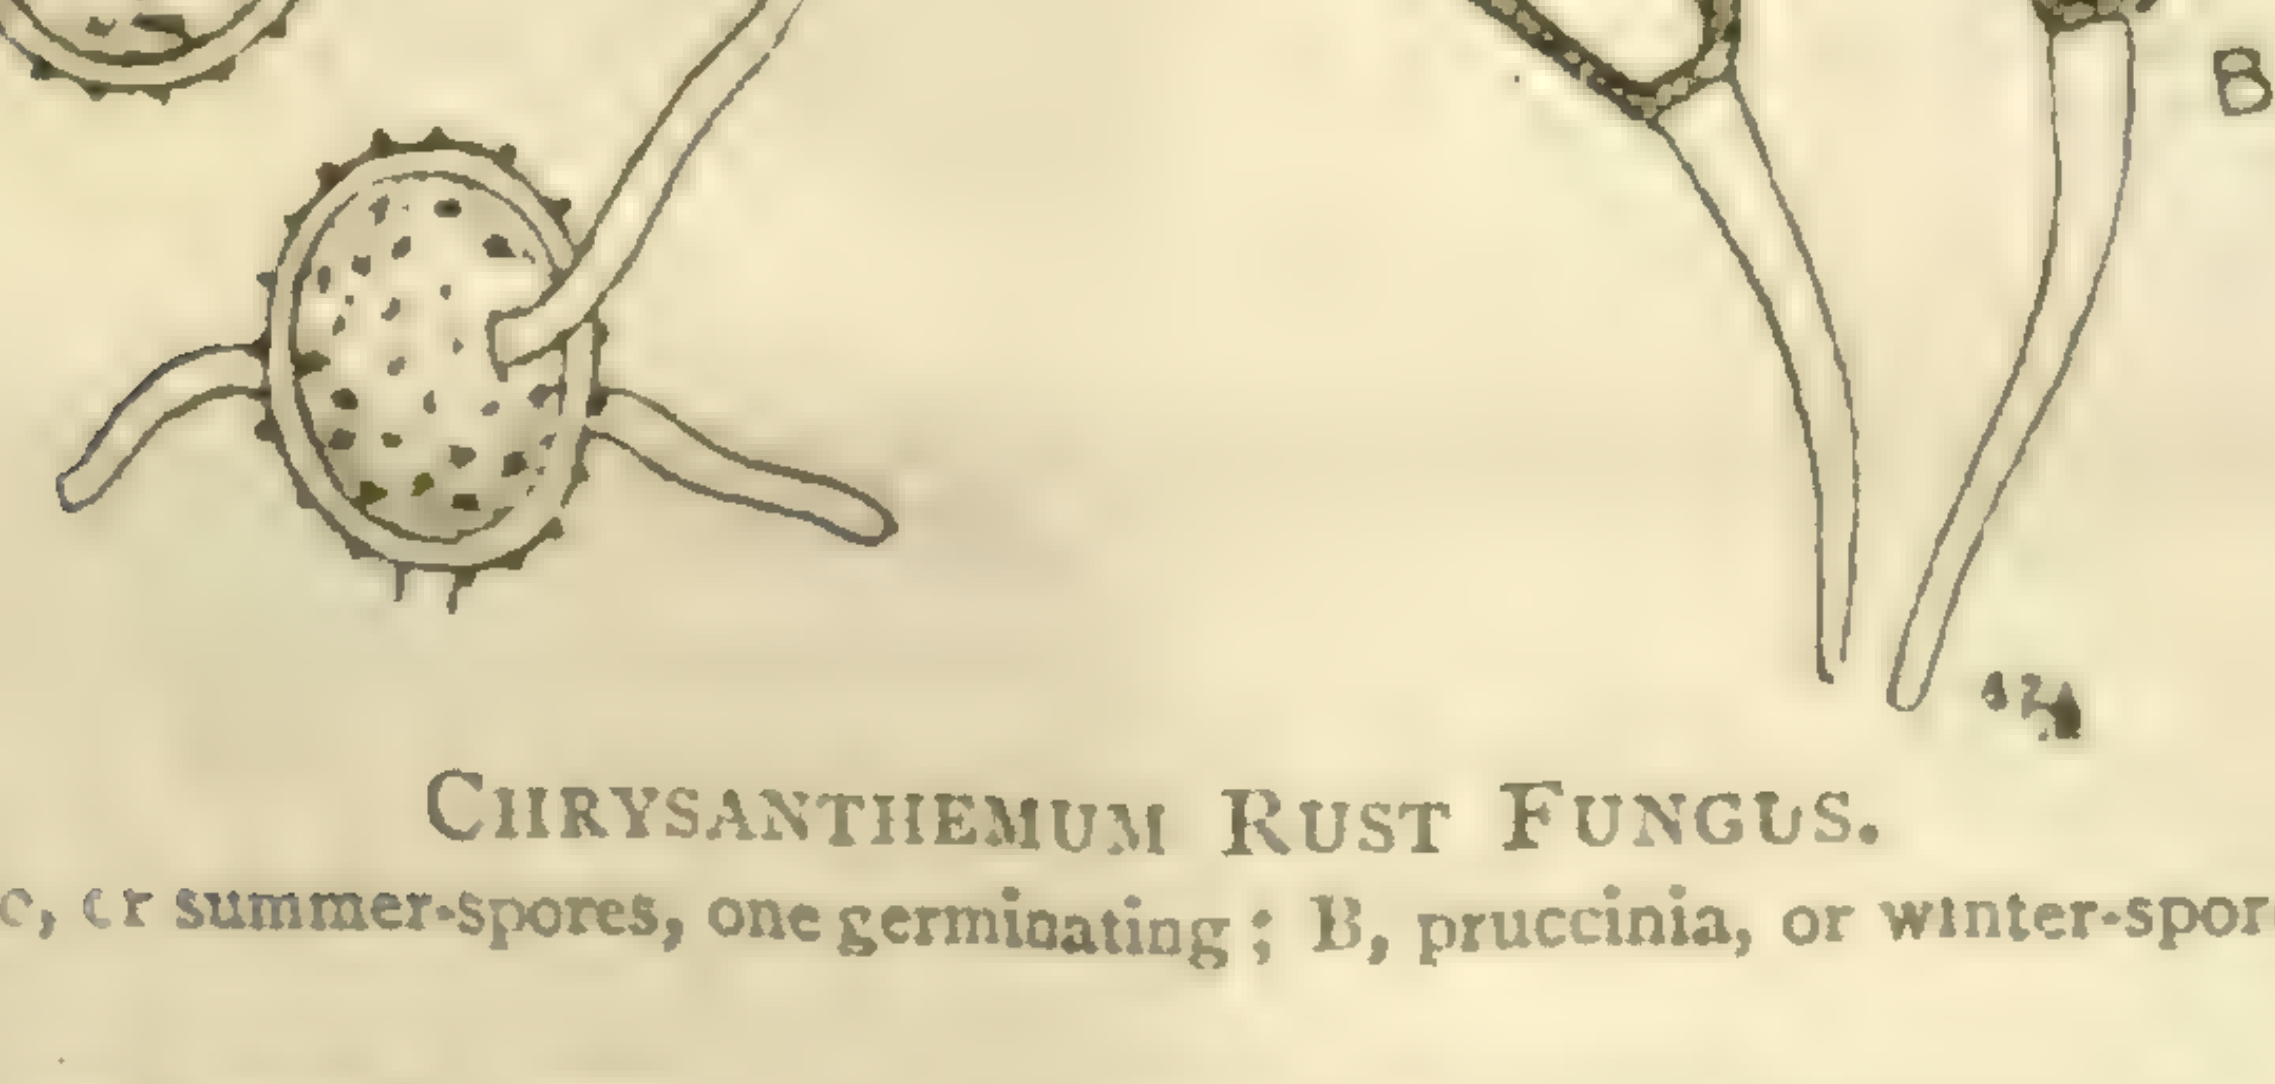
FUNGI are very remarkable plants in many respects. Their quaint forms, peculiar colours, and often poisonous properties, led to their being considered uncanny, and associated with witchcraft and other peculiar practices during the dark ages. Consequently they were promptly destroyed on every possible occasion by proper-minded people. Even at the present day it is interesting to observe that the majority of people consider it a duty, even at the expense of slight inconvenience to themselves, to kick over every toadstool with which they come in contact; an inherited survival, almost unconsciously performed, persisting after the cause of its origin has been forgotten.

CHRYSANTHEMUM-LEAF INFECTED WITH RUST.

Again, fungi differ from the great majority of plants in not being able to obtain their food directly from the soil, but are *saprophytes*, obtaining their food from dead organic matter, or *parasites*, living on and obtaining their food from living plants, or in rare instances parasitic on animals. It naturally follows that fungi follow in the wake of the higher plants, from which they derive their food, and are never pioneers in the extension of plant life.

Finally, as a rule, parasitic fungi do not indiscriminately attack any plant that comes in their way, but can only live and enjoy life fully on those particular orders of plants on which their ancestors flourished.

Puccinia Hieraci, the Chrysanthemum Rust fungus, has long been known to mycologists, those peculiar people who devote their time to the study of fungi, as a very common fungus in Britain, growing on various kinds of composite plants, as the hawkweeds, burdock, nipplewort, knapweed, &c., and such people are not in the least surprised to learn that this fungus has claimed the cultivated chrysanthemum as a host, considering that it is a member of the family specially favoured by the attention of the fungus. The principal reason why the fungus is so very abundant on chrysanthemums is because these plants are just now usually grown in crowded communities, and it is so much easier to pass from one plant to another than is the case in a state of nature, where the host plants are usually scattered; besides, it entails no pecuniary loss to anyone if a few hundred hawkweeds are destroyed, hence its ravages on wild plants pass by unobserved.



CHRYSANTHEMUM RUST FUNGUS.
A, uredo, or summer-spores, one germinating; B, pruccinia, or winter-spores, X 400.

The rusty spots so abundant on the leaves represent the *uredo*, or summer fruiting stage, of the fungus. Spores are produced in myriads, and germinate as soon as they are mature, and although the fungus is deprived of the usual means of spore diffusion when growing on plants cultivated in houses, this misfortune is more than compensated for by kindly sprayings, watering, and sundry disturbances of the plants, which enable the spores to reach still healthy parts of the plants, which promptly become inoculated with the disease. When the disease is first observed all suspicious plants should be removed, and the remainder sprayed with potassium sulphide, which destroys germinating spores. Later in the season the leaves that have borne uredo spores now produce the winter form of fruit, the spores of which do not germinate until the following spring, when they inoculate the young chrysanthemum leaves, and give origin to the uredo stage of the disease. From the above account it will be seen how very important it is to collect and burn all leaves bearing the winter form of fruit, as the recurrence of the disease depends entirely on the presence of these spores in the vicinity of the plants. G. MASSEE.

EXHIBITING DAHLIAS.

THE dahlia show, which may be said to have given birth to the National Dahlia Society, was held in St. James's Hall in 1858, and ever since that time, when a special exhibition of dahlias has been held, some attempts have been made to illustrate the decorative value of the dahlia. From the device of thirty or forty years ago, which only produced incongruities and monstrosities, to the tables of dahlias to show their decorative value, which was inaugurated at Earl's Court in 1893, and reproduced in 1897 at the Crystal Palace, there have been seen attempts to reach this end, but they have produced but little in the way of practical results.

All the writing and talking in the world will never get rid of the present method of exhibiting the show and fancy dahlias on boards. For what is the ruling purpose of exhibiting but to show a particular flower in as fine a character as it is possible to obtain it, whether it be the dahlia, rose, carnation, or any other. To this end special and attentive culture is necessary to bring out as far as possible the possibilities of the flower, and that being done, the next thing to do is to exhibit it so that as much as possible of its surface can be seen, and its perfect symmetry noted. A perfect show dahlia may be a formal looking flower, but there is no better method of showing off its fine proportions to better advantage than when placed in contrasting lines on an old-fashioned board. All competitive exhibitions must of necessity be formal, it is inevitable from their very purpose. I do not think the florist who grows his dahlias especially for exhibition purposes should be lectured because he prefers to show his dahlias in a particular way. This particular way, sanctioned by long usage and universal adoption, is conducive to a complete critical examination on the part of those whose business it is to decide upon the merits of competing stands of blooms, as it enables the whole surface of the flower to be noticed; and if there are defects in any they are revealed. A perfect dahlia stands as an emblem of power in a flower, and mankind admires power, whether it be manifested in a vegetable product or human being, an animal, or a work of art.

The present method of showing cactus, pompon, and single types on wire frames is formal in the extreme, but is the means of displaying the individual blooms to the best advantage, and it is difficult to see how the method can be advantageously improved upon. If dahlias are to be shown in vases, as suggested in these columns, the stems must be wired to keep them in an upright position, and then they will exhibit just as much formality as when arranged on boards. There are but very few, indeed, of our large show and fancy dahlias the flower stems of which are stout enough to support a heavy bloom in an upright position for any length of time. It is, if anything, worse than the cactus varieties. The pompon type might be utilised in vases of, say, a dozen blooms each, because the flowers are small, and the stems generally of a somewhat rigid character. The single varieties are so fragile that their value for decorative purposes is greatly discounted by their fleeting floral service.

By all means let opportunity be afforded at our dahlia exhibitions for "demonstrating the possibility of producing artistic effects in the garden," and there are many gardens that furnish pleasant illustrations as to how the dahlia can be used in this way. There are hundreds of houses which have gardens decorated with dahlias that within doors furnish delightful illustrations of how the dahlia can be employed in brightening the home. By all means make our dahlia shows as varied as is possible, but let the florist who grows for exhibition follow his own inclinations and methods as an important part of the dahlia exhibition. There is plenty of room for him and for his belief that the flower he tends with so much care is the incarnation of every attribute of beauty, as well as for the artistic critic who is rich in epithet and condemnation, but poor in inventive resource. All that is said against the present method of exhibiting show dahlias is said against the mode of showing specimen blooms of chrysanthemums, but they will survive the shock of these periodical attacks, and be witnessed at exhibitions long after the suggested methods for the attainment of artistic excellencies have proved illusive and disappointing.

I venture to throw out the suggestion that the Royal Horticultural Society might appropriately devote one of its meetings—one at the end of August or early in September—to the production of appropriate methods for utilising the dahlia for decorative purposes. A paper bearing upon the subject and formulating suggestions might be read, and discussion invited. This, if carried out, may operate to bring out something better adapted to be shown in public than has been suggested or illustrated during the past thirty years. It might well become a part of the programme of the society in the year 1899. RICHARD DEAN, V.M.H.

HOMOLOGY OF PLANTS.

By Professor F. O. Bower, D.Sc., F.R.S.

(Continued from page 635.)

Here a brief reference must be made to the very beautiful results of Wager on the changes in the zygote of *Cystopus candidus*, which have been verified and extended by Berlese. Wager states that in this fungus the process of fertilisation does not differ in any essential particular from the process as it takes place in Angiosperms. On the division of the fusion-nucleus of the zygote the number of the chromosomes present before division appears to be considerably in excess of the number observed in the nuclei of the ogonium. "By counting as carefully as possible, twenty to twenty-four, or even more, appear to be present, and the impression is produced that the number is certainly much larger than that observed in the oogonium." Divisions of the nucleus then follow to form four, eight, sixteen, and finally thirty-two, in which condition a period of rest ensues; and, finally, it appears that a division of each into four follows, to form the nuclei of four spores. Wager believes the reduction to take place at this last division, and Berlese has established a strong probability that such a reduction actually does take place. Plainly these observations are not final or conclusive, and even if they were, the strict homogeny of this fruit-body with a rudimentary sporophyte of a green plant would not be proved. It must, however, rank at least as an important parallel case, illustrating how the reduction may be effected in a distinct line of descent.

We see then that in green Algæ such as *Œdogonium*, *Sphæroplea*, and *Coleochæte* certain divisions follow fertilisation, but we are not yet in possession of the nuclear details. I prefer, therefore, to suspend judgment as to the nature of those divisions; but in view of the peculiar behaviour already seen in other zygotes it may be distinctly anticipated that some form of reduction will be demonstrated at that stage. If that be shown then we shall be right in recognising in these small cell-bodies the rudimentary correlative of a sporophyte—the sort of beginning from which a neutral generation may have sprung in land-living plants. We cannot go farther than this as regards the green Algæ until we are in possession of the facts. There is no greater desideratum in morphology at the present moment than a detailed knowledge of the germination of zygotes such as that of *Œdogonium*.

Here I may remark that the admirable observations of Professor Klebs, whom the Section will welcome as a distinguished guest, do not appear to me to touch this question. His very varied and convincing experiments show in a number of algæ and fungi that, as regards the succession of vegetative and sexual modes of propagation, the experimenter has a very complete control. I do not find, however, any observations of his which touch the behaviour of germinating zygotes of green algæ as regards details of segmentation. I do not mention this as in the least impairing the brilliancy of Professor Klebs's work, but because Professor Ward has brought Klebs's results to bear upon the discussion on antithetic alternation in a manner which I do not think that the facts will support.

II.—Bryophyta.

Turning now to the bryophytes, these plants stand at the moment in a somewhat discredited position. We have been warned by Dr. Scott that "there is no reason to believe that the Bryophyta, as we know them, were the precursors of the Vascular Cryptogams at all," and that "there is no appreciable resemblance between the fruit of any of the Bryophyta and the plant of any Vascular Cryptogam," and the suggestion has been thrown out afresh that they may really be "degenerate descendants of higher forms."

In view of statements such as these it may be well to examine the Bryophyta quite separately, without reference to Vascular Plants at all, and see what are their main bearings on theories of alternation. And if the Bryophytes were the only Archegoniate Plants in the world, I think the case for their origin by a progressive antithetic alternation would be an uncommonly strong one. The points which are especially noteworthy are: (1) The readiness with which they may be arranged in natural sequences which illustrate increasing vegetative complexity of the sporophyte as a consequence of progressive sterilisation; (2) the nuclear details, which are as yet known, however, in only few cases; (3) the constancy of the two alternating phases, the relations of which are very seldom disturbed by apospory, and never, to my knowledge, by apogamy.

The first of these matters has been dealt with at length in my "Studies." It is, of course, possible for anyone to read such sequences as are there mentioned in reverse order, and to uphold a theory of simplification; but this must be shown to be in accordance with probability. Now it appears to me that the general probability in the case of the Bryophytes is against simplification, for the larger the number of spores which can be matured the greater the probability of survival; even in cases where, as in *Buxbaumia* and *Diphyscium*, there is an exiguous, and probably reduced Moss-plant, the sporogonium is not of a reduced type, but, on the contrary, unusually large. It seems to my mind much more probable that the Bryophytes, as a whole, illustrate a course of progressive complexity. A comparison of anatomical details frequently suggests a progressive sterilisation, a process which we see demonstrated both in Pteridophytes and Phanerogams, where actual conversion of potentially sporogenous tissue into temporary or permanent vegetative tissue does occur. When it is added that the nuclear evidence, scanty though it still is, shows the sporophyte with a double number of chromosomes, and the reduction taking place on the tetrad division of the spores, the comparison with the segmented zygotes of algæ and fungi those mentioned seems inevitable. The position of those who hold views of antithetic alternation will, therefore, be that the simple sporogonium was produced as a post-sexual growth. The starting point was probably some such multicellular body as we see nowadays in certain algæ and fungi resulting from division of the zygote, but not necessarily homogenetic with any such body that we know now living. The land-habit imposed a restriction on fertilisation, and an alternative method of increase in numbers was an advantage. The multicellular body resulting from division of the zygote provided the means for this; the cells developed separately as dry, dusty spores. As the number of divisions increased the powers of the plant to nourish, protect, and disseminate the spores became the measure of the number produced. Hence followed the elaboration of the nourishing and disseminating mechanism, which has involved a diverting of some cells from their first office of spore-production, the start being, perhaps, made in a manner similar to the formation of the peridium in the uredineæ. To my mind—taking the bryophyta alone—there is an inherent probability in all this, which far counterbalances any of the obstacles which have been raised against it.

The greatest obstacle is the fact of apospory in mosses. This departure from the usual alternation will be more generally discussed in relation to the ferns, where it is more frequent. Besides its being artificially induced in mosses by special treatment, it appears also to have been noted by Ugo Brizi in *Nature*, in the case of atrophied capsules of *Funaria*, which had buried themselves in the soil. The essential point is the production of the sexual generation by direct vegetative growth from the neutral. This would appear to involve a reduction of chromosomes, but Pringsheim's drawings show nothing analagous to the usual process of tetrad division to form the spores; the reduction, if it occurs, must be effected in some other way.

A theoretical suggestion on this point will be made later. Meanwhile let us estimate its probable importance as regards the bryophyta. It cannot fail to strike the observer how uniform is the alternation in these plants; there are, I believe, no recorded cases of deviation from the normal alternation in liverworts. I know of only a single case of apospory among mosses taken in the open, and then in atrophied capsules; apospory, when induced, follows such extreme treatment as chopping the sporogonium into pieces. And it is not as if the mosses and liverworts had escaped detailed observation; hardly any group of plants has been more carefully examined by competent observers. Deviations from strict alternation then are rare, and appear under physiological stress. This great group, which includes the simplest sporophytes among archegoniate plants, is also singularly constant in its alternation. I think this is to be connected with the permanently dependent condition of the sporophyte; its equable physiological condition, nursed and protected by the moss plant, finds its morphological expression in its comparative uniformity. Conversely the independent position of the sporophyte in ferns, and its exposure to varied conditions may have elicited more freely in them unusual developments.

(To be continued.)

TIGRIDIAS.

The Tigridias or Tiger Flowers are truly remarkable members of the great family of Irideæ—remarkable for large and handsome blooms of the most gorgeous and varied hues, some of which display white, yellow, orange, and scarlet in striking contrast, whilst others are heavily spotted and blotched with black and red on yellow, white, and purple grounds. These spots or blotches, which thickly cover many of the flowers, have procured for them the popular name of tiger-flowers. Various species and hybrids of Tigridias have been introduced in recent years with the natural sequence of increased interest being shown in them, and a greater demand for these Mexican bulbs. Ease of culture is a distinguishing feature, if a dry, sunny border can be devoted to them—as they then prove quite hardy and may remain in the soil throughout the winter; but if grown in heavy or damp soil it may be advisable to lift and store in sand until the severest weather is past and over.

Although the blooms are very evanescent, being truly "flowers of a day," this is fully counterbalanced by the quantity produced, if good culture obtains. As above mentioned, a dry, sunny border suits them best, a light, rich soil being necessary to bring them to the greatest perfection, a position frequently recommended for their cultivation being under the breakfast-room window, as, generally speaking, this will be found on the sunny side of the house, and, furthermore, the tigridias always appear to the best advantage during the early hours of the day, for many flowers, in full bloom then, are decidedly *passee* after noontide, but only to be replaced by others the following morning. For indoor culture the bulbs may be potted as soon as received, in November or December, in a sandy loam, to which some growers prefer to add one-fourth of peat. Water sparingly throughout, to avoid anything like stagnation. After flowering is over grant perfect rest in a dry and frost-proof place. It is only fair to state that much better and stronger plants are obtained from the open border, granted the essential conditions of success, than from pot culture. The normal period of blooming is from June to August.

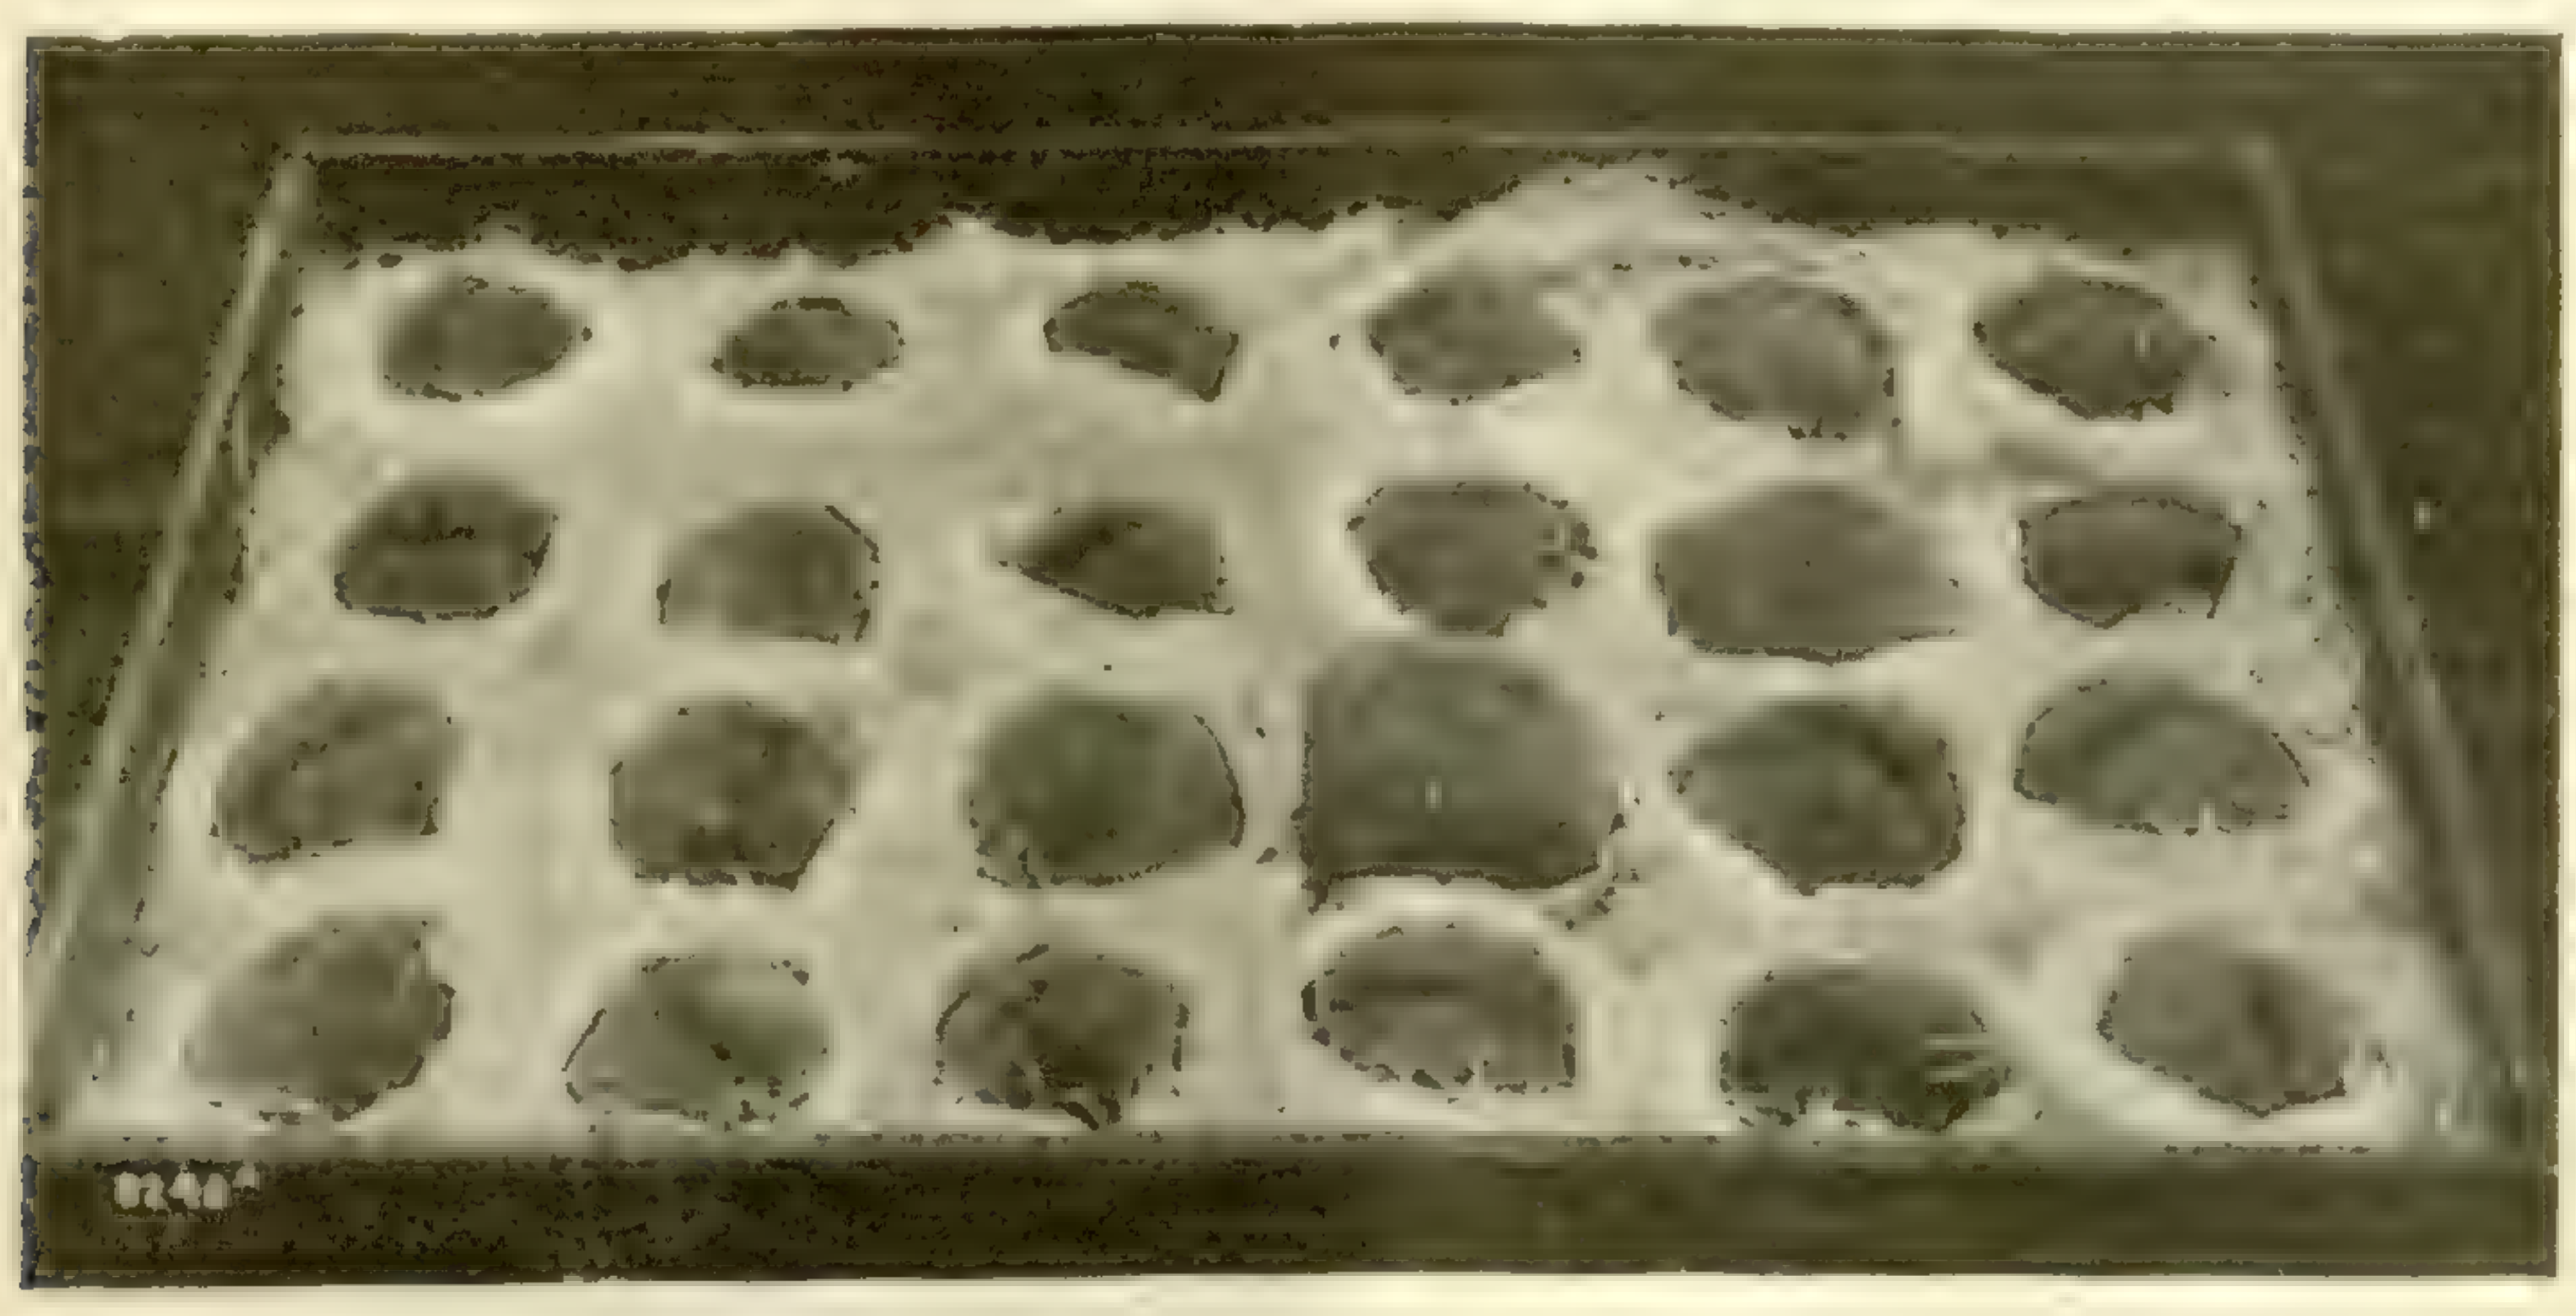
The following list, though very incomplete, includes some of the oldest and best known along with a few noteworthy novelties. Tigridia pavonia, orange-red, well known, very showy; T. p. grandiflora alba, large and beautiful flowers, white spotted with crimson; T. p. g. a. immaculata, pure white, a perfect gem; T. p. g. aurea, petals rich old gold colour, mottled chocolate, very fine; T. p. conchiflora (the Shell Flower) is yellow, crimson spotted; T. canariensis, yellow, with fine scarlet spots; T. Van Houttei, yellow and chocolate brown, a charming little species; T. violacea is very pretty, with violet-dotted centre, a true Mexican. In addition to the foregoing we have T. Pringlei, a kind of glorified T. pavonia; and T. Patscuaro, with bell-shaped flowers, white-tipped and blotched with crimson lake, a decided acquisition.

A good border of mixed Tigridias always proves an attractive feature, for in it we may have many hundreds of curious and beautiful flowers, with scarcely two alike, embracing all the colours of the rainbow, grotesquely mixed and blended. It also affords a daily transformation scene. Surely these "Mexican Day Lilies" are equalled by but few, and surpassed by none, the cultivator being amply repaid for the little time and care bestowed upon them.

Ripon. F. Dixon.

ROYAL HORTICULTURAL SOCIETY'S GREAT FRUIT SHOW.

IN fulfilment of the promise made in our issue of October 1, we give the continuation and conclusion of our report of the great exhibition of British grown fruit held at the Crystal Palace on September 29 and 30, and October 1. We also present our readers with five illustrations of leading and interesting exhibits. Messrs. G. Bunyard and Co.'s gold medal exhibit was one of the chief attractions at the show, as readers will readily understand from a glance at our reproduction from a photograph, and the descriptive account on p. 643. The first prize, won by Mr. A. R. Allan, gardener to Lord Hillington, Hillington Court, Uxbridge, with the three fine bunches of Muscat of Alexandria grapes represented, was a handsome clock, valued at £5, and presented by Messrs. Wood and Son, Wood Green, a noted firm of horticultural sundriesmen.



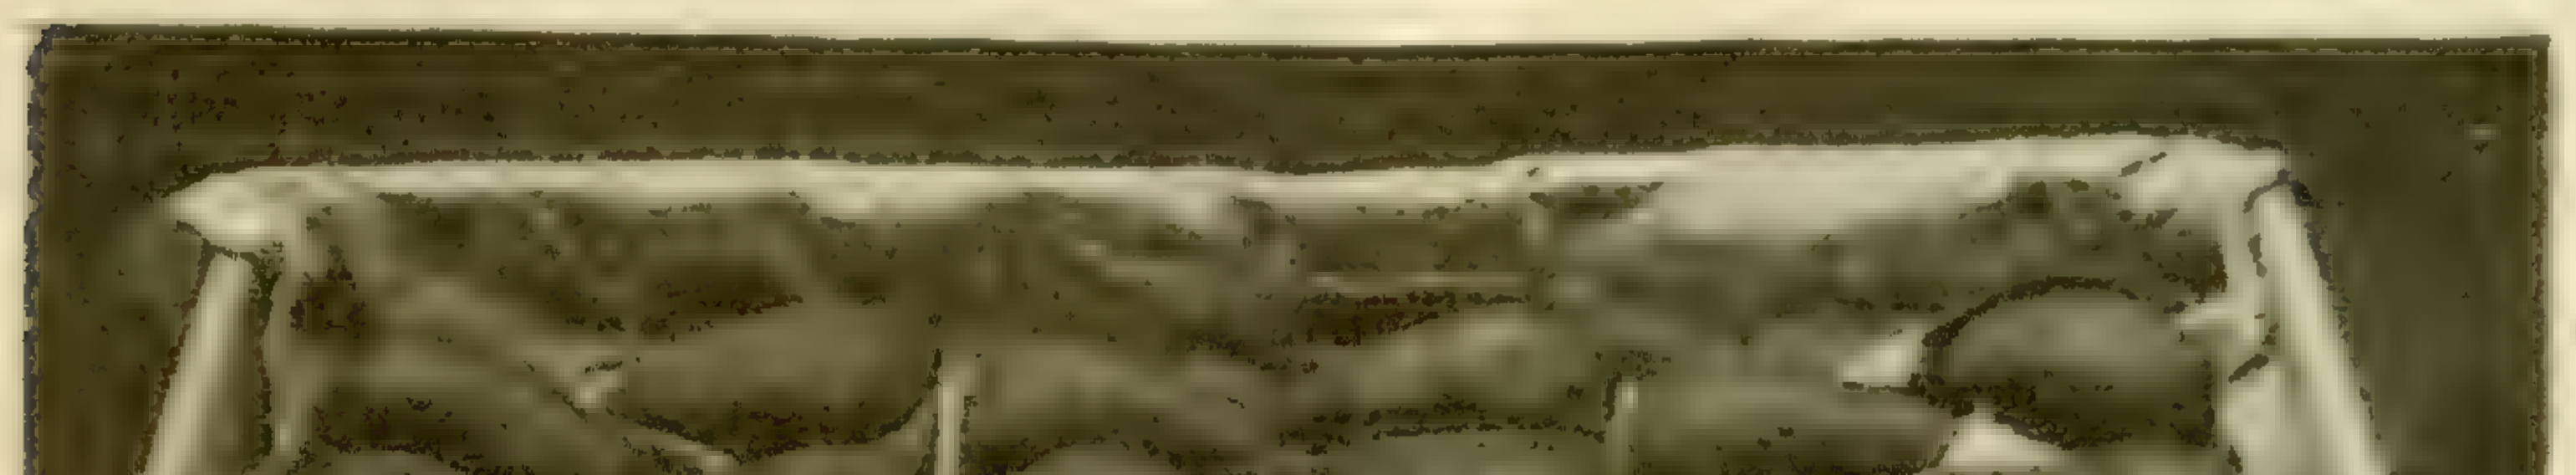
FIRST PRIZE BOX OF PEACHES (PACKED), SHOWN AT THE CRYSTAL PALACE, BY MR. J. GORE, POLEGATE.

Considerable interest attaches to the new departure of the society in providing a section for market growers, for while the exhibits as a whole taught us little that was new, it served in very many cases to show what to avoid in the way of packing, and, in some very few cases, presented features worthy of compliment. The most interesting exhibit was that of apples packed and grown by Mr. Basham, of Bassaleg, and referred to in detail in another column; Mr. Gore's method of packing peaches was simple in the extreme and effective; while Mr. Wyatt, of Hatton, also used shallow boxes for his samples of Durondeau pears, and the fruits had all carried well.

MARKET GROWERS' CLASSES.

This was a most interesting section and quite a new one; it was also educational as showing packing methods and suggesting various improvements. In the class for a single layer of black Hamburgh grapes, not less than 12 pounds, in a baby basket, no prize was awarded, as in the only basket shown the fruit had carried badly. In a similar class, but for any other black grape but Black Hamburgh, Mr. G. Thompson, grower to Messrs. W. and E. Wells, Hattonhurst, Hounslow, secured first prize with well finished Gros Maroc that were as good as if only just cut; apparently no second prize was awarded though there were other competitors. No prize was awarded for white grapes in a baby basket. Mr. J. Gore, Polegate, Sussex, won first prize for grapes packed in any other than a baby basket, his fruit being packed in a cotton-wool and paper-lined cross-handled basket, a fine method of packing for market.

The best set of four varieties of cooking apples shown in baskets or boxes containing 42 pounds net, came from Mr. E. Basham, Griffin Gardens, Bassaleg, who sent his fruit in white wicker flats packed in two layers; the varieties were Bismarck, Lord Derby, Ecklinville, and Lane's Prince Albert; this was a first class method of packing, and each layer contained about three dozen fruits; the second prize was awarded to Mr. A. Wyatt, Hatton, Middlesex, who staged rounds of Manks Codlin, Stirling Gastle, Golden Noble, and Loddington. Mr. Wyatt scored for four packages of dessert apples containing about 20 pounds each; he sent half-sieves of Duchess Favourite, Worcester Pearmain, Cox's Orange Pippin, and King of the Pippins, all finely coloured and not at all damaged; Mr. G. Tebbutt, Isleworth, came second with Worcester Pearmain, Yellow Ingestre, King of the Pippins, and Blenheim Orange. For a package of 42 pounds of cooking apples Mr. G. Tebbutt, Isleworth, won with Lady Henniker, in a sieve; Mr. Wyatt, second, with Damelow's Seedling, similarly packed.



FIRST PRIZE BOX OF PACKED PEARS, DURONDEAU, SHOWN AT THE CRYSTAL PALACE, BY MR. WYATT, HATTON, HOUNSLOW.

The best 20 lb. package of dessert apples was a half-sieve of Cox's Orange Pippins, shown by Mr. McKenzie Bradley, Leylands, Meopham; Mr. J. Jeune, Tonbridge, came second with the same variety and a similar package; the square boxes did not gain the favour of the judges. In the class for a 42 lb. package of apples, showing improved methods of packing for market, Mr. W. Galpin, Wincanton showed a box containing three layers of apples, thirty-five fruits per layer, but without any packing material beyond the blue paper lining. The judges made no award, as they did not think the method superior to others in vogue. For pears, two varieties, in two packages, each containing about 20 lbs., there was a fair competition, the first prize falling to Mr. A. Wyatt, Hatton, who had good Williams' Bon Chretien and Pitmaston Duchess in the usual half-sieves; the fruits were well graded, and had carried well; Mr. G. Tebbutt, second; two packages were shallow wicker baskets, but, though the fruits were good, lack of packing material was evident, and no award was made.

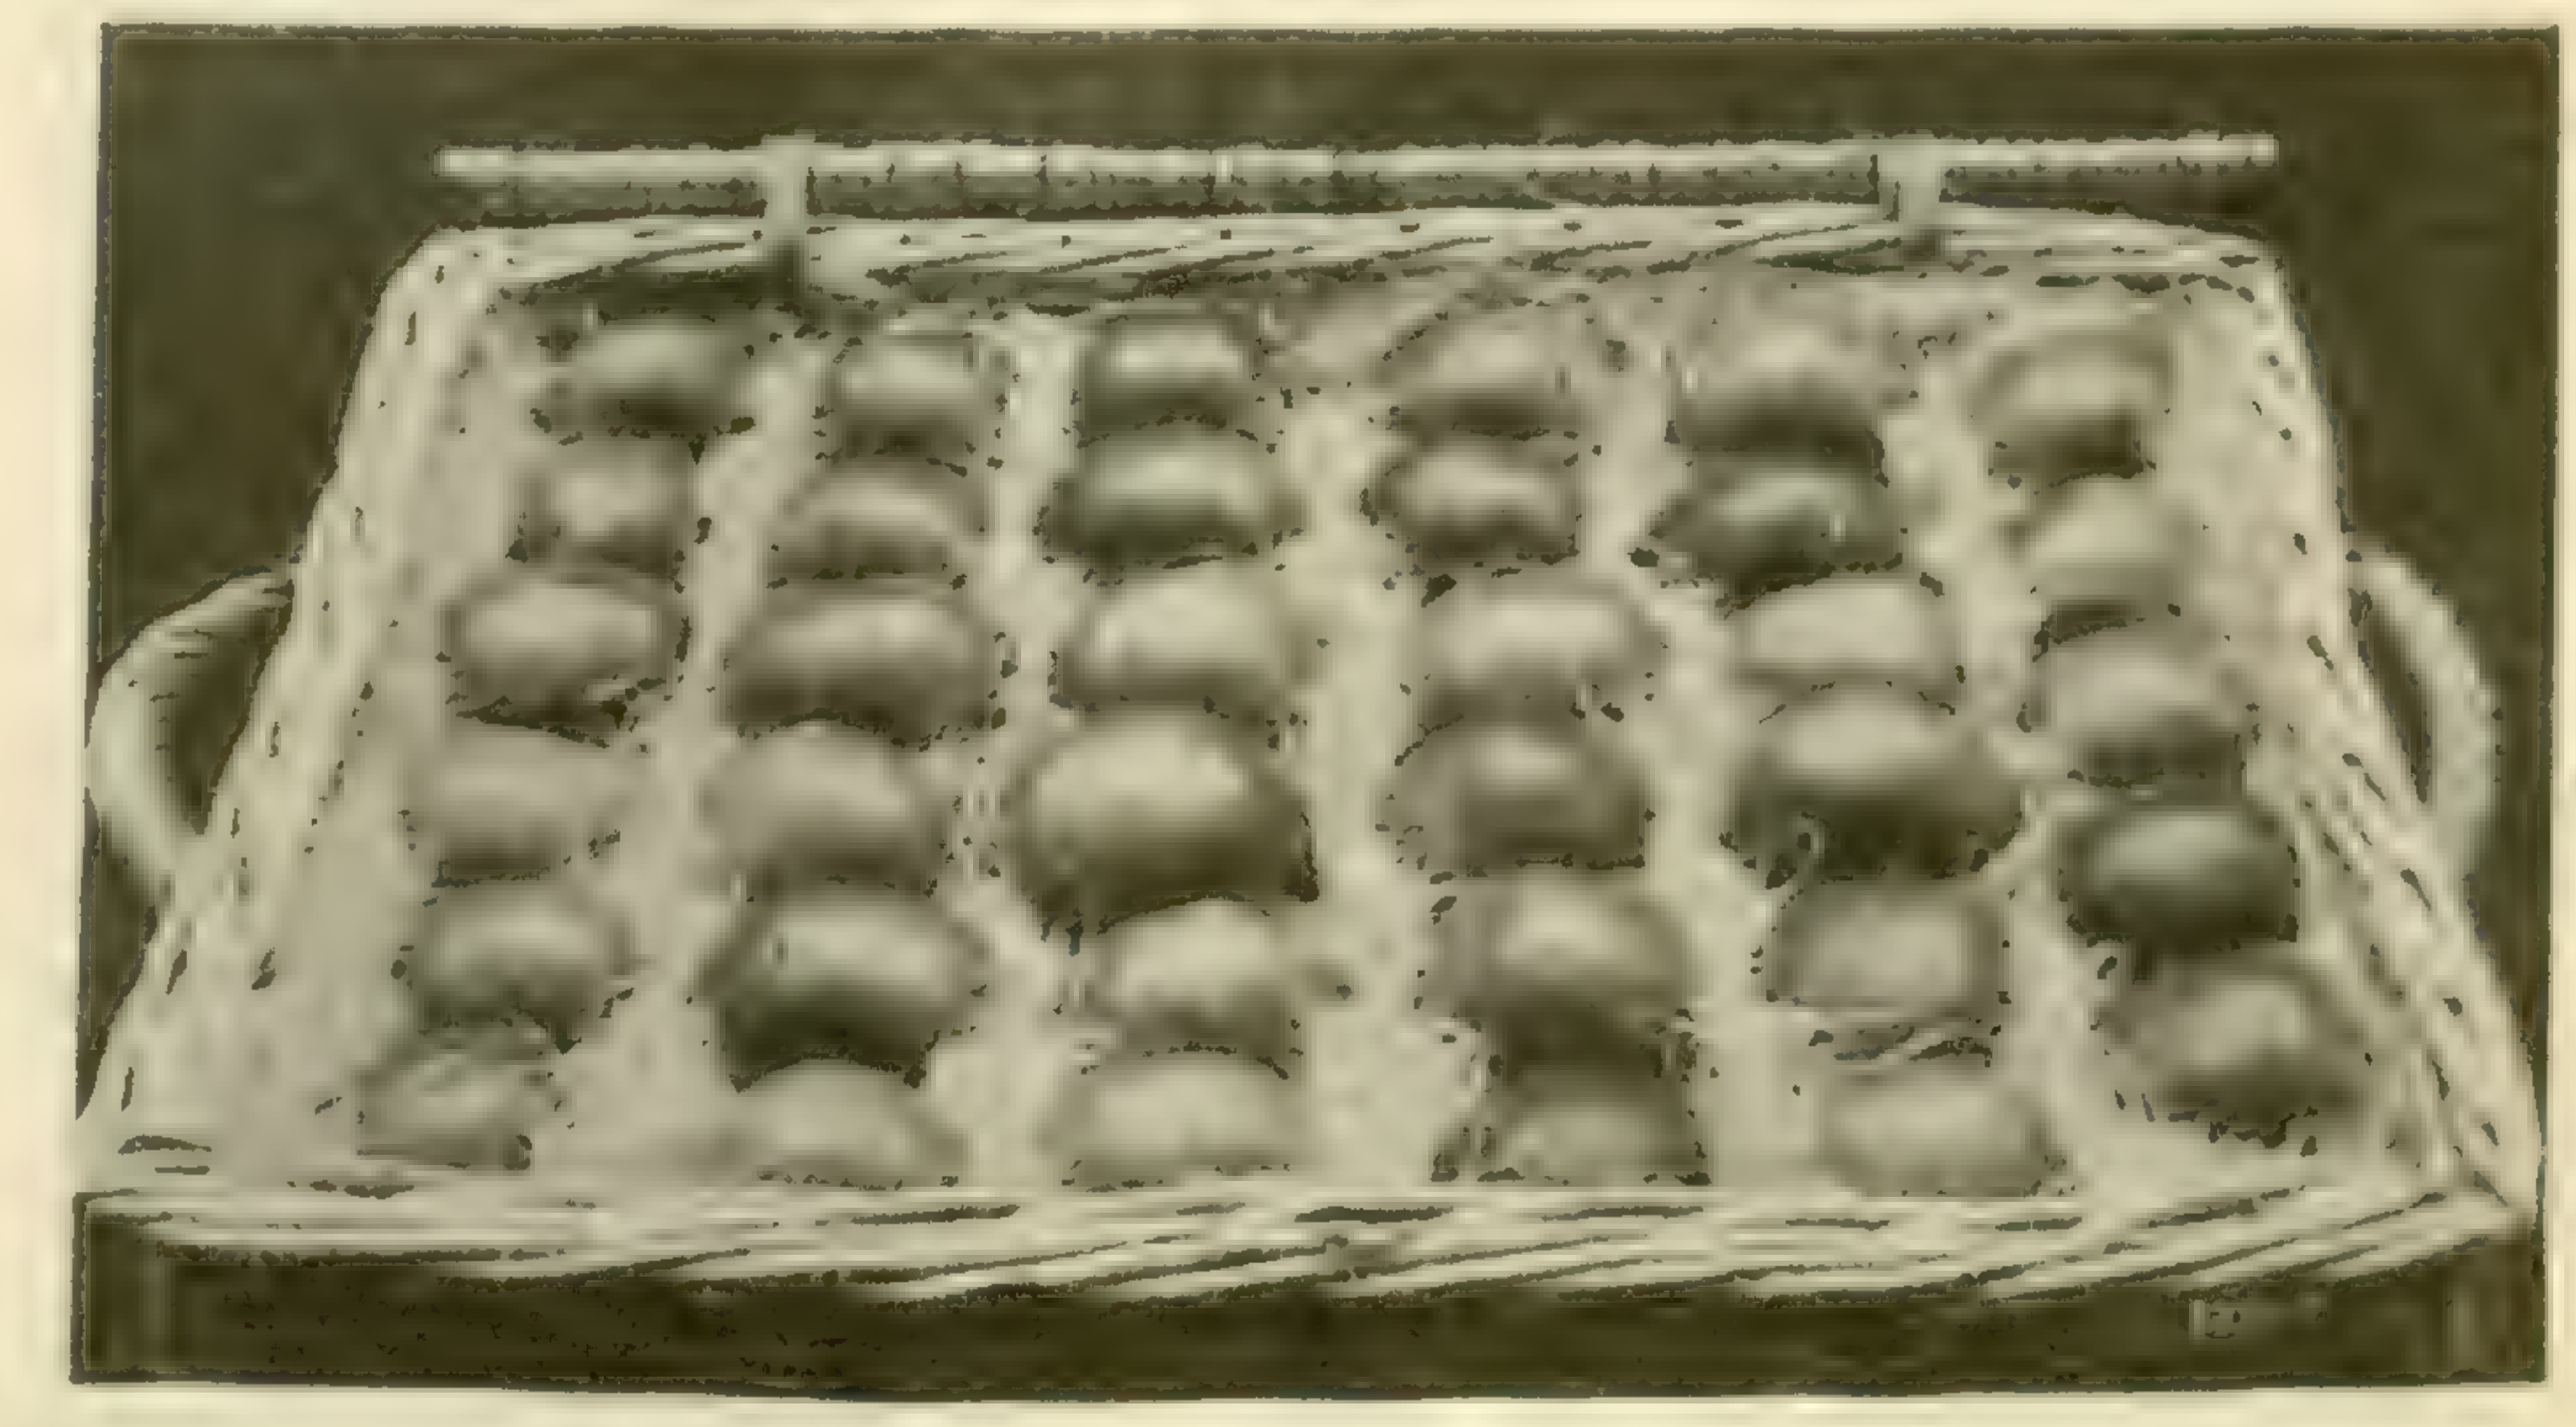
There were four packages containing from two to four dozen fruits of a choice dessert pear, packed for market, and here the first prize was won by Mr. A. Wyatt, who sent fine examples of Durondeau, packed in a single layer on wood wool in a shallow box; each fruit was wrapped in pink paper, but leaving one cheek exposed; Mr. G. Thompson, second. Only a second prize was awarded for a packet of 28 lb. of cooking plums, these being examples of Sandell, neatly packed in a half-sieve, by Mr. G. Tebbutt; the square basket from Ightham was rejected. Mr. A. Wyatt had the best basket of damsons.

Mr. J. Gore had the best box of peaches, packing his fruit in a thin wrap of cotton wool and embedding them in fine wood wool; they carried well, and presented an attractive appearance. Mr. J. Miller, gardener to Lord Foley, Esher, gained second prize, but it seems to us that he should have been disqualified, for the schedule states that "gentlemen's gardeners or amateurs, who sell surplus fruit, and nurserymen, are excluded from this division." Mr. C. Marchand, Somerfield Plantation, Maidstone, sent his peaches in bags of a soft material, but not otherwise packed; not a good method, we think. The best package of filberts or cob nuts was a 20-lb. square wicker basket of fine nuts sent by Mr. J. Jenner, Tonbridge; Mr. J. Durling, Ightham, second, with a similar packet of Kent cobs. The best package of tomatos, about 12 lb., was a cross-handled basket of two layers of fruit, sent by Mr. J. Gore; Mr. W. Iggulden, Frome, second, with a similar package. Shallow boxes were again passed by the judges in this class. Altogether this section was not so educational as we had expected it would be; however, doubtless it will be a greater success in future if continued. Mr. Basham's display was the only really distinctive feature in it.

SPECIAL DISTRICT COUNTY CLASSES.

In this division the counties of England were divided into six districts; one district combined some Welsh and English counties; another district took all but four of the Welsh counties; while Scotland and Ireland each formed a separate district. Two classes were provided for each district, making a total of twenty classes, one for six dishes of apples, and one for six dishes of pears. Two prizes were offered in each class, and in both cases the third-class railway fare of the competitor was the award coupled with £1 and 15s. respectively for first and second prize-winners with apples, and £1 10s. and £1 respectively in the case of pears.

Kent growers had a class all to themselves for six dishes of apples, and here Mr. W. Stowers, gardener to G. Dean, Esq., Sittingbourne, was first with superb fruits of Peasgood's Nonsuch, Emperor Alexander, Worcester Pearmain, Cox's Orange Pippin, Bramley's Seedling, and Lane's Prince Albert; Mr. G. H. Sage, gardener to the Marquis of Camden, Lamberhurst, second. In the Kent growers class for six dishes of pears there was but one entry, the first prize being awarded to Mr. G. H. Sage, for first-rate examples of Souv. du Congrès, Williams' Bon Chretien, Beurre Bachelier, Doyenne du Comice, General Todleben, and Pitmaston Duchess.



BASKET OF APPLES, ECKLINVILLE, PACKED BY MR. E. BASHAM, BASSALEG, NEWPORT.

The second county district included Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall; here there were eight lots of six dishes of apples, the first prize being won by Mr. W. Camm, gardener to the Duchess of Cleveland, Battle Abbey, Sussex, who showed Ribston Pippin, Cox's Orange Pippin, Mère de Ménage, Peasgood's Nonsuch, Stirling Castle, and Warner's King; Mr. G. Lock, gardener to B. H. Hill, Esq., Newcombes, Crediton, was placed second; he had grand fruit, but it had been highly polished and so probably lost points. In this divison, the best six dishes of pears came from Mr. W. Slogrove, gardener to Mrs. Crawford, Gatton Cottage, Reigate, who showed excellent examples of Louise Bonne of Jersey, Beurre d'Amanlis, Souv. du Congrès, Fondante de Cœurne, and Pitmaston Duchess; Mr. J. Witt, gardener to H. Padwick, Esq., Horsham, was placed second among seven competitors.

In the class for growers from Wilts, Gloucester, Oxford, Bucks, Beds, Herts, and Middlesex, there were ten exhibits of apples, and Mr. T. Turton, gardener to G. Gorden Nicol, Esq., Maiden Erleigh, Reading, came first, with fine fruits of Cox's Orange Pippin, Ribston Pippin, Loddington, Mère de Ménage, Peasgood's Nonsuch, and Warner's King; Mr. W. J. Empson, gardener to Mrs. Wingfield, Ampthill, second. There were eight sets of pears staged, the best lot coming from Mr. W. A. Cook, gardener to Major Heneage, V.C., Compton Basset, Colne, Wilts, his set being Beurre Diel, Louise Bonne of Jersey, Marie Louise, Doyenne du Comice, Pitmaston Duchess, and Williams' Bon Chretien. Mr. R. Chamberlain, gardener to F. M. Lonergan, Esq., Cressingham Park, Reading, second.

The combined counties of Essex, Suffolk, Norfolk, Cambridge, Hunts, and Rutland, brought out a display of only five sets of apples, the best being splendid samples of Peasgood's Nonsuch, Cox's Orange Pippin, Ribston Pippin, Bramley's Seedling, Loddington, and Warner's King, from Mr. J. Bowery, gardener

FIRST PRIZE MUSCAT OF ALEXANDRIA GRAPES, SHOWN AT THE CRYSTAL PALACE BY MR. A. R. ALLAN, HILLINGDON COURT GARDENS, UXBRIDGE.

MESSRS. G. BUNYARD AND CO.'S GOLD MEDAL EXHIBIT OF FRUIT AT THE CRYSTAL PALACE.

to H. Burnard. Esq., Hingham, Norfolk; Mr. J. C. Tallack, Livermere Park Gardens, Bury St. Edmunds, came second. Only two sets of pears came from these counties, the first prize being awarded to Mr. A. Andrews, gardener to the Hon. W. Lowther, Campsea Ash, Wickham Market, for dishes of Beurre Hardy, Maréchal de la Cour, Williams' Bon Chretien, Doyenne du Comice, Souvenir de Congrès, and Pitmaston Duchess; Mr. J. Nicholson, gardener to J. W. Mellis, Esq., Sewardstone, second.

Three competitors came forward in the class open to growers from Lincoln, Northampton, Warwick, Leicester, Notts, Derby, Shropshire, and Cheshire, Mr. J. Lee, Higher Bibington, Cheshire, scoring for apples with Worcester Pearmain, King of the Pippins, Alfriston, Peasgood's Nonsuch, Ecklinville, and Warner's King; Mr. Divers, gardener to the Duke of Rutland, Belvoir, second. For pears Mr. T. Bennett, Shavington Gardens, was first in this division with very fair samples of Louise Bonne of Jersey, Marie Louise, Williams' Bon Chretien, Beurre d'Amanlis, Pitmaston Duchess, and Beurre d'Anjou; Mr. Divers second.

Two collections of apples came from the combined areas of Worcester, Hereford, Monmouth, Glamorgan, Carmarthen, and Pembroke, the best being Cox's Orange Pippin, Worcester Pearmain, Bramley's Seedling, Stirling Castle, Peasgood's Nonsuch, and Lord Derby, staged by Mr. R. M. Whiting, Credenhill, Hereford; Mr. Bateman, Leominster, second. No pears were shown.

In the class for growers in other counties of Wales than previously specified, two sets of apples were forthcoming, Mr. G. Squibbs, gardener to the Dowager Lady Winn, Llangedwyn, Denbigh, coming first with Cox's Orange Pippin, Ribston Pippin, Mère de Ménage, Lord Suffield, Tower of Glamis, and Alfriston; Mr. H. Austin, gardener to L. P. Pugh, Esq., Abermaide, Aberystwith, second. Mr. Squibbs and Mr. Austin were first and second respectively for pears.

A class was provided for growers in the six northern counties of England, and in the Isle of Man; here the competition was by no means keen, two sets of apples and no pears being set up; Mr. W. J. Jeffrey, gardener to the Earl of Harewood, Leeds, was first prize-winner with Worcester Pearmain, Cox's Orange Pippin, Potts' Seedling, Stirling Castle, Lord Suffield, and Alfriston; Mr. R. J. Hind, Formeby, near Liverpool, second.

Among growers from Scotland Mr. J. Day won first place for six dishes of apples, with first-rate fruits of Worcester Pearmain, James Grieve, The Queen, Loddington, Peasgood's Nonsuch, and Warner's King. Mr. Day, who is gardener to the Earl of Galloway, Garlieston, Wigton, was also first for pears, with splendid examples of Gratioli of Jersey, Louise Bonne of Jersey, Madame Treyve, Williams' Bon Chretien, Doyenne Boussoch, and Pitmaston Duchess. There were no exhibitors in the class for growers from Ireland; this is a great pity, as good fruit can be grown in the sister isle, and the inducement of railway fare for prize winners should have had the effect of bringing out a few of the best growers.

Nurserymen's Fruit Displays.

The numerous non-competitive exhibits put up by the leading nurserymen added considerably to the effect of the show as a whole, but these exhibits would have been even more interesting had they been entered for competition.

The Hogg Memorial medal was awarded to Messrs. T. Rivers and Sons, Sawbridgeworth, for a magnificent display of fruit chiefly grown with the help of an orchard house; the specimens of Peasgood's Nonesuch, Ribston Pippin, and Cox's Orange Pippin were revelations of high culture, as also were the grand examples of Pitmaston Duchess, Louise Bonne of Jersey, Parrot, and Beurre Hardy pears. There were splendid lots of Gladstone, Sea Eagle, Thomas Rivers, Lady Palmerston, and Princess of Wales peaches, in neat baskets; boxes of luscious and finely-bloomed Admiral, Jefferson, Decaisne, Pond's Seedling, Monarch, Grand Duke, Golden Transparent, President, and Autumn Compote plums; handsome clusters of highly-finished Gros Maroc and Alicante grapes; and freely fruited pot trees of apples, pears, and plums. Half a-dozen fruits of Warner's King apple, shown by the Sawbridgeworth firm, were enormous examples.

Messrs. J. Veitch and Sons, Chelsea were awarded a Hogg Medal for a large, comprehensive, and attractive exhibit of fruit. In the centre they had pot trees of apples, pears, and figs, all freely fruited; these were flanked by mounds of extremely pretty and quaint ornamental gourds, while dishes and baskets of apples and pears filled out the long tables. Among the apples we noted very fine baskets of Lord Grosvenor, Warner's King, Sandringham, Seaton House, Cellini, Hanwell Souring, Bramley's Seedling, Lane's Prince Albert, King of the Pippins, Peasgood's Nonsuch, Blenheim Orange, Cox's Orange Pippin, Tyler's Kernel, Standard Bearer, King Harry, Fearn's Pippin, and Court Pendu Plat. Among pears we made note of Marie Louise d Uccle, Beurre Superfin, Princess, Pitmaston Duchess, Beurre Fouqueray, Doyenne Boussoch, Souv. du Congres, Marguerite Marillat, Clapp's Favourite, Charles Ernest, Marie Louise, Gidley's Beurre, Beurre Clairgeau, and Glou Morceau among about a hundred varieties well shown. Negro Largo figs, Morello cherries, Late Devonian peaches, Mackinley and Popham pears, Beacon, Sir J. Banks, and Livermere Favourite apples, late blackberries, and St. Joseph strawberries were also shown by this firm.

A silver-gilt Knightian medal was awarded to Messrs. J. Cheal and Sons, Crawley, for their exhibit of apples, pears, plums, &c., arranged with cut dahlias, young fruiting apples, pears, and figs. The exhibit was a large one, and made a good display; down the centre were some very large mounds of splendid Bismarck apples, also big baskets of Lord Grosvenor, Bramley's Seedling, Pott's Seedling, Jubilee, Walthamstow Beauty, Peasgood's Nonsuch, Nanny, Old Nonesuch, Colonel Vaughan, Blenheim Pippin, Frogmore Prolific, and Warner's King; this was a splendid contribution, and not so monotonous and flat as many. The display made by Messrs. J. Peed and Sons, Norwood, S.E., was a great attraction, and well deserved the silver Knightian medal awarded. From the corners some vines were extended, so as to meet in the centre, and the alternate rows of depending bunches of black and white grapes tied along the rods were very realistic. Below were fine baskets of highly coloured fruit, the mounds of Bismarck, Emperor Alexander, Cox's Orange Pippin, Peasgood's Nonsuch, Beauty of Kent, King of the Pippins, Tyler's Kernel, and Mère de Ménage being very fine; pears were equally good, and the collection comprehensive.

Messrs. Sutton and Sons, Reading, had a very comprehensive and attractive display of tomatos, no other fruits being shown; they were represented by scarlet golden, red, and peach-coloured sorts, also round and pear-shaped varieties. The fruiting plants in pots were the great attraction, and especially worthy of note were the specimens of Golden Nugget, Abundance, A1, Best of All, Peachblow, Eclipse, Princess of Wales, and Sutton's Sunbeam, all introductions of the Reading firm; a silver Knightian medal was awarded. We may add that the fruit in baskets had all been grown in the open air on the trial grounds of the firm. Cider was shown by Messrs. Gaymer and Son, Attleboro', Norfolk; this firm also sustained their reputation as apple growers by the display they made on their conical stand; besides cider apples there were excellent dishes of the best dessert and culinary varieties. Mr. W. Horne, Perry Hill, near Rochester, exhibited a few good samples of apples, pears, and plums, gaining a bronze Banksian medal. Mr. R. C. Notcutt, Broughton Nurseries, Ipswich, sent a really good lot of fruit, showing what can be done in the Eastern counties; there were first-rate dishes of Cox's Orange Pippin, Cellini, Warner's King, Bramley's Seedling—twelve dishes weighing sixty pounds—Ribston Pippin, The Queen, Mere de Menage, Gascoigne's Scarlet, Dr. Harvey, and Ecklinville, among many others; silver Banksian medal.

From Forest Hill, Messrs. J. Laing and Sons brought a fine lot of hardy fruit, staging their apples and pears in baskets and dishes; pot trees of apples and pears, carrying good crops, made an attractive centre to the group, while the baskets of Grenadier, Alfriston, Bismarck, Cellini, Peasgood's Nonsuch, Cox's Pomona, and Emperor Alexander apples made a splendid show; in the collection of pears we noted Souvenir du Congres, Dr. Jules Guyot, Duchess d'Angouleme, Gen. Todleben, Beurre Bachelier, Beurre Superfin, Pitmaston Duchess, and Doyenne Boussoch as being especially well represented; silver Knightian medal. Mr. B. Wells, Crawley, sent a few samples of good apples, his dishes of Peasgood's Nonsuch, Worcester Pearmain, very fine, Bismarck, Lord Suffield, Adelaide, and Cox's Orange Pippin were first rate; Mr. Wells also showed samples of native seedling crab stocks, which he considers hardier than the usual free stock. Mr. W. Taylor, Hampton, gained a bronze Banksian medal for a small but select collection of apples and pears staged mostly in neat baskets; Hawthornden, Jubilee, Bismarck, Stirling Castle, and Cox's Orange Pippin apples, and Gratioli and Pitmaston Duchess pears were the best samples.

An attractive exhibit came from the Horticultural College, Swanley; there were good samples of popular apples, pears, plums, and nuts, set on a groundwork of wood wool and amid maidenhair fern; three towers made of bottled fruits of various kinds attracted a good deal of attention, as the fruits were preserved whole in every case, even down to raspberries. From Messrs. S. Spooner and Sons, Hounslow, came a collection of clean and nicely-coloured apples and pears, altogether about one hundred and fifty dishes or baskets of fruit; though not over large, the fruits shown by the Hounslow firm were especially clear skinned throughout; a silver Banksian medal was awarded. Mr. G. J. Squibbs, gardener to the Dowager Lady Williams Wynn, was awarded a silver Banksian medal for a collection of about seventy dishes of highly-coloured apples and well-developed pears, grown at Llangedwyn, Denbighshire; the Williams' Bon Chretien, Durondeau, Pitmaston Duchess, Doyenne Boussoch, Catillac, and Marie Louise pears, and the Magnum Bonum plums were very good.

From the Royal Nurseries, Handsworth, Sheffield, Messrs. Fisher, Son, and Sibray sent about eighty varieties of apples and pears; this exhibit seemed to show that good colour can be obtained in outdoor apples even as far north as Sheffield; the specimens were clean and of fair size, and represented those varieties that succeed best in the northern and colder midland counties. This firm grows considerably over a hundred thousand apple trees of various forms and varieties. Messrs. Fisher, Son, and Sibray also showed four fine melons, a green fleshed variety named Countess of Derby, and obtained by crossing Knowsley Favourite with William Tillery; it has a dark skin, and light netting that is very pretty. The variety has already gained numerous awards, and is first-class in size, cropping powers, and flavour.

Floral Exhibits.

Messrs. J. Laing and Sons, Forest Hill, had a pretty corner group near the orchestra, making a tasteful display with begonias, caladiums, palms, heaths, and an assortment of orchids. On the opposite corner a group of ivies was put up by Mr. J. Russell, Richmond Nurseries, Richmond; this was a very interesting display, for the ivies were well grown, well coloured, and represented in great variety; Hedera arborea Silver Queen, H. arborea Russelliana, H. a. aurea, and H. a. Regneriana were first-rate plants largely shown. Messrs. J. Laing and Sons also made a bright display with Michaelmas daisies, dahlias, Physalis Franchetti, rudbeckias, and other late autumn flowers; they also had a big group of trained bays, Acer Negundo variegata, araucarias, ferns, bamboos, and other suitable furnishing material.

Messrs. H. Cannell and Sons, Swanley, put up a brilliant group of cannas produced in the usual first-rate style one expects from the Home for Flowers. Messrs. W. Cuthbush and Sons, Highgate, contributed a goodly display of flowers, plants and fruits, their exhibit consisting of mounds of carnations, Begonia Gloire de Lorraine, well-grown bouvardias, pernettyas, nerines and crotons; around these mounds the firm grouped dishes of fine apples and pears, plums, tomatos, and Excelsior onions of great size; the firm sent three bunches of the somewhat new Lady Hutt white grape, and gained for the whole display a silver Banksian medal. Messrs Paul and Son, Cheshunt had a group of roses that were very fragrant and made an acceptable display—a sort of "last rose of summer" exhibit.

Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, Herts, showed fruiting growths of eighteen varieties of ricinus; a silver Banksian medal was awarded. The kinds represented were: R. Gibsoni, R communis, R. communis major, R. carboriensis arboreus, R. Gibsoni mirabilis, R. viridis, R. glaucus, R. atropurpureus, R. purpureus, R. corboriensis, R. cambodgensis, R. africanus albidus, R. sanguineus, very attractive; R. Belot Defourgeres, R. sanguineus tricolor, R. africanus, R. zanzibarensis, and R. macrocarpus; an effective group of sub-tropical subjects that not a few gardeners took care to make notes about. Mr. J. R. Box, West Wickham, Croydon, showed a table of cut begonia blooms staged in crosses, circles, and other devices; ferns and palms were used among the flowers.

A large and interesting group of hardy plants was put up by Messrs. J. Veitch and Sons, Chelsea, and it contained a large assortment of such well-grown bamboos, as Arundinaria auriconia, A. Fortunei variegata, B. Veitchi, Arundinaria Hindsii, and A. H. graminia, Phyllostachys aurea, P. Henonis, and P. viridis-glaucescens. Towering above the bamboos and Eulalia zebrina, a grand specimen, was a large example of Gynerium argenteum Rendatleri, carrying a number of elegant plumes of a rosy-silver hue. This was a very useful exhibit. A bright but rather too regular display of dahlias came from Mr. T. S. Ware, Tottenham. The centre of the group was composed of handsome cactus dahlias, the golden Mrs. C. Turner being conspicuous; pompon dahlias were grouped at one end, while at the other were baskets of very fine tuberous begonias, double and single, in a variety of pleasing colours.

Sundries.

Messrs. Wood and Sons, Wood Green, N., had quite an artistic display of sundries, and it would be difficult to mention many things required by a gardener which the firm did not represent; there were manures of various kinds, chiefly their own specialities, weed killers and insecticides, orchid baskets, samples of peat and loam, raffia, bast, labels, baskets of many kinds, knives, saws, blinds, stakes, watercans, jardinieres, &c., all making quite an attractive exhibit. Mr. J. Pinches, Camberwell, exhibited a large assortment of the metal labels that have rendered his name famous among horticulturists; his display was arranged with a few plants and flowers. Highly commended was the award made to Mr. Pinches for his useful and durable labels.

HERBACEOUS PLANTS IN DROUGHT.

THE whole of the south-eastern part of England has been under the spell of an anti-cyclone for several weeks past. Here we had a month ago a fine fall of rain amounting to one and a-quarter inches, but we have had none since, and it is melancholy to see how some things suffer by it. It suits cannas to perfection where they have been previously taken care of, but on the other hand, it has acted very banefully on the gandavensis section of gladiolus; fine spikes are formed, but no time is given to them to develope; as soon as two or three blooms open they frizzle up with the intense heat, and so it is almost impossible to obtain a good spike. At such times then any plant that blooms satisfactorily is deserving of care and attention. Amongst these I would mention:—

Senecio pulcher.—I have a good plant of this now displaying its striking flowers; it is perfectly hardy, and easily propagated by cutting its large flesy roots into pieces about two inches long; the flowers are what I should call a magenta hue, but in some catalogues they are said to be purplish crimson; the flowers are five inches across, and altogether it forms one of the most striking of our early autumn perennials.

Crinum Powelli.—This very fine bulbous-rooted plant was raised by Mr. Powell, of Southborough, near Tunbridge Wells, and is remarkably vigorous and striking in appearance; it has thriven well with me in ordinary garden soil in a position somewhat sheltered, and I suppose, from the size of its roots and the depth to which they go, it has not suffered from the excessive drought we have now had to endure for some weeks; the flower stem is perhaps not so high as it would have been if we had had some rain; I have also the white variety, Crinum Powelli album, which, however, has not flowered this year.

Zauschneria californica.—I see that some writers complain of this beautiful autumn perennial not being hardy, and, indeed, suggesting means for its protection in winter; with me the great difficulty, in this south-eastern part of England, is to keep it within bounds. It is planted on a dry part of my rockery, and by means of its underground stolons it has run about in all directions, and I have to uproot a large quantity every year. It requires a hot, dry time in order to enable it to flower well and truly, consequently this season has been peculiarly favourable to it, and my plant is covered with its bright vermilion-coloured flowers.

Linum flavum.—This is another plant about which some people have doubts as to its hardiness, but may it not be that there is another plant which is sometimes confounded with it, viz., Linum arboreum, which I am told some people have not found perfectly hardy.

Helenium grandicephalum striatum.—This a grand autumn flowering plant. I received mine from Mr. C. J. Grahame, in whose garden I saw it flowering; it grows to the height of about four feet, and is covered with branching heads of flowers of bright orange, irregularly striped and blotched with crimson, giving it a very striking appearance amongst the autumnal blooms.

Lilies.—I do not think there is any tribe of plants which excels in beauty of colouring, elegance of form and sweet perfume, the lilies. From early spring to late autumn some of the many species are continually with us, and so now in this second week of September I am rejoicing in two clumps amongst others which are a daily source of pleasure to me. One is a fine clump of Lilium auratum, which has sixteen expanded blooms at the same time, and appears to be in rare health, yet my experience of many years leads me to look upon it very doubtfully. I have had as fine clumps of it before, but the next year hardly anything of them appeared; the bulb has a bad habit of breaking up, and when it does this, all hope of retaining good blooming stems vanishes, and yet it cannot be so with every one, or else how could it be possible to be able to purchase enormous bulbs the size of double-closed fists, and these are not always imported. There are many varieties of it, such as Rubro-vittatum, Virginale and Wittei, which all seem to share the same unpleasant way of acting, hence it is that the immense quantities which are every year imported are necessary, for those who wish to grow the species and its varieties. Another clump that I have gives me greater satisfaction, not only because of its great beauty, but because I know it means to stay; it is that beautiful variety of L. speciosum called Melpomene, the most richly coloured of all the crimson spotted varieties, and very vigorous in growth; there are many varieties of speciosum, but I do not think that any of them can compare with this. We owe its introduction to an American horticulturist, the late Mr. Hovey, of Boston. The Dutch bulb growers have successfully cultivated it, and bulbs can now be had at a comparatively trifling cost. Other varieties of speciosum are also in flower, but none are comparable to this.

Tropæolum speciosum.—Oh! how I have battled with this, and what pains I have taken since I first saw it many years ago in Wigtonshire, to get it to stay with me. I there saw it in every possible situation, in cottage gardens, on churchyard walls, climbing up apple trees, and in every conceivable position; nor was it particular as to aspect, although I was told it required a northern position, yet I saw it in the full blaze of sunlight, and everywhere a marvel of beauty. I have once more given it a trial under different circumstances. I obtained last autumn some roots from the gardens of Kenninghame Castle, Wigtonshire; instead of planting these as I had previously done, I procured a tolerably deep basket, knocked the bottom out of it, plunged it in the ground to its edge, and filled it with well-prepared light soil, just in front of some shrubs; the plant has made very vigorous growth, climbed up the shrubs, but as yet I do not see any appearance of flower. I am told by some I ought not to expect this the first year of planting, and I am therefore hopeful, if spared till next year, I shall see it covered with flower; it is a most exquisite plant, and I shall be delighted to overcome its difficulties. I should say that my reason in planting it thus was that I found it travelling about in all directions, but still refusing to flower.

H. H. D.

THE PEAR CROP.

Anglesey.—Pears are quite a failure owing to the cold, wet spring.—W. HUNTER, *Baron Hill Gardens.*

Berks.—Pears are very unsatisfactory this season, and our best varieties are Beurre Giffard, Jargonelle, Beurre d'Amanlis, Beurre Mortilett. Louise Bonne of Jersey, Thompson's very good, Marie Louise, Pitmaston Duchess, Beurre Superfin, Hacon's Incomparable, and Knight's Monarch.—J. TEGG, *Bearwood Gardens.*

Berwickshire.—We have a very fair crop of many varieties. Trees on walls good crop and fruit a fair size, some trees are bearing a very heavy crop. Hessle pears scarcely up to last year, but a fair crop. Wall trees with shelter from east winds are the best with me this year. Suffered very much with frost and winds in the spring, and as my garden is close upon the Tweed, frosts are severe with us.—J. FOSTER, *Paxton House Gardens.*

Bucks.—Pears are small owing to the dry weather. Beurre d'Amanlis, Beurre Clairgeau, Beurre Hardy, Williams' Bon Chretien, Doyenne du Comice, Duchesse d'Augoulême, Glout Morceau, Madame Treyve, Pitmaston Duchess, Citron des Carmes, Fertility, and Louise Bonne of Jersey are the best.—J. SMITH, *Mentmore Gardens.*

Cardiganshire.—Pears are an average crop, and in some instances trees are loaded. We have nearly twice as many pears as apples in these gardens. Williams' Bon Chretien rarely misses a crop, and this year is very heavy and good. Jargonelle is most disappointing; very few pears are to be had from it at any time. Amongst the best crops are Doyenne Boussoch (heavy), Duchesse d'Angoulême, Beurre Diel, Beurre Bachelier, Doyenne du Comice, Pitmaston Duchess, Easter Beurre, Knight's Monarch, Bergamotte d'Esperen, and Clapp's Favourite, whilst fairly good are Josephine de Malines, Marie Louise, Winter Nelis, and General Todtleben. That fine-flavoured variety, Louise Bonne of Jersey, has a good crop, but, as usual in this district, is cracked and scrubby.—R. C. WILLIAMS, *Crosswood Park Gardens.*

Cheshire.—Pears as a crop are about the same as apples; if anything, rather better. The kinds bearing best are the following: Williams' Bon Chretien, Marie Louise, Emile d'Heyst, Doyenne du Comice, Doyenne Boussoch, Louise Bonne, Durondeau, Nouvelle Fulvie, Easter Beurre, Beurre d'Amanlis, Marie Louise d'Uccle, Beurre Diel, Autumn Colmar, Red Doyenne, Thompson's, Easter Beurre, Winter Nelis, Glout Morceau, and Beurre Rance.—W. WHITAKER, *Crewe Hall Gardens.*

Denbighshire.—Pears are good. Williams' Bon Chretien, Clapp's Favourite, and Souvenir du Congrès exceedingly fine; Beurre Diel, Beurre Clairgeau, Pitmaston Duchess, Beurre Superfin, Beurre Batchelier, and Marie Louise are also good.—H. FORDER, *Ruthin Castle Gardens.*

Derbyshire.—Pears are more general than apples, both on walls and pyramids. Citron des Carmes, Doyenne d'Ete, Jargonelle, Beurre d'Amanlis, Williams' Bon Chretien, and Althorpe Crassane are the heaviest cropped pyramids; Louise Bonne of Jersey, Beurre Hardy, Beurre Diel, Pitmaston Duchess, Fondante d'Automne, Beurre Superfin, and Doyenne du Comice are the best on walls. The freest-bearing new varieties on walls are Clapp's Favourite, Triomphe de Vienne, Beurre Fouqueray, President d'Osmanville, Magnate, and Marguerite Marillat.—J. H. GOODACRE, *Elvaston Castle Gardens.*

Devonshire.—Pears are a medium crop. Beurre d'Amanlis, medium; Beurre Brown, good; Beurre Easter, fair; Beurre Superfin, fair; Bon Chretien, heavy; Doyenne du Comice, slight; General Todtleben, good; Glout Morceau, fair; Josephine de Malines, fair; Louise Bonne of Jersey, heavy; Marie Louise, fair; Pitmaston Duchess, fair; Winter Nelis, fair; and Catillac, good. The pear crop was partly spoiled by the heavy hailstorm in the spring. The fruits are showing the marks now where the hail struck them; some of them have as many as four pits in them, which would spoil their sale.—S. J. RICHARDS, *Mount Edgcumbe Gardens.*

County Down.—Pears are a good average crop on wall trees. Marie Louise, Williams' Bon Chretien, Jargonelle, Glout Morceau, Emile d'Heyst, Beurre d'Amanlis, and Beurre Diel are carrying heavy crops of fine fruit. No fruit on bush trees; in fact, pears will not bear fruit worth picking in this district except those grown against walls.—J. LEICESTER, *Seaforde Gardens.*

—— Pears are almost a failure, and especially so on unprotected walls. The cold winds during the early part of June completely destroyed the crop, which up to then was very promising. A few important varieties that were afforded slight protection are very fine, though scarce, Souvenir du Congrès, Clapp's Favourite, Pitmaston Duchess, Glout Morceau, Beurre Diel, and Williams' Bon Chretien being the best. Some of the late varieties on standards, such as Ne Plus Meuris, Beurre Capiaumont, Prince Consort, Winter Nelis, and the Bergamots are fairly productive.—T. BRADSHAW, *Hillsboro' Castle Gardens.*

Dublin.—Pears are a good crop here, and good quality, especially on walls. The following sorts have done well on pyramids: Beurre Diel, Beurre d'Amanlis, Citron des Carmes, Louise Bonne of Jersey, Williams' Bon Chretien, Marie Louise, Glout Morceau, Doyenne d'Ete, Beurre Bosc, and Beurre Hardy.—G. SMITH, *Vice-Regal Gardens.*

Dumbartonshire.—Pears are rather a poor crop.—W. McHUTCHEON, *Auchendennan Gardens.*

Dumfriesshire.—Pears are only slightly cultivated, and this year but partly successful. All are trained as espaliers, Comte de Lamy, Hazel, Louise Bonne of Jersey, Williams' Bon Chretien, Flemish Beauty, and Autumn Bergamot. Hazel is by far the most prolific, but none this season.—J. URQUHART, *Hoddon Castle Gardens.*

Durham.—The varieties that generally do well here are Jargonelle, Duchesse d'Angoulême, Beurre d'Amanlis, Doyenne du Comice, Clapps' Favourite, Williams' Bon Chretien, Beurre Diel, Pitmaston Duchess, Winter Nelis, Chaumontel, Flemish Beauty, and Beurre Superfin.—J. TULLETT, *Raby Castle Gardens.*

East Lothian.—There has been a very good crop of Louise Bonne of Jersey, Clapp's Favourite, Bergamotte d'Esperen, Beurre d'Amanlis, Jargonelle, Beurre Bachelier, Pitmaston Duchess, Souvenir du Congrès, and Marie Louise.—G. TAYLOR, *Broxmouth Park Gardens.*

Essex.—Pears are a very bad crop in these gardens, and I believe it to be almost such throughout the district with an occasional exception. The most productive varieties here are Knight's Monarch, Vicar of Winkfield, Duchesse d'Angoulême, Beacon, Louise Bonne of Jersey, Magnate, Beurre Bosc, Beurre d'Amanlis, Princess, Durondeau, Chaumontel, Marie Louise d'Uccle, Beurre Hardy, and Doyenne Boussoch.—A. KIMBER, *Gorfield Hall Gardens.*

Fifeshire.—Jargonelle, Marie Louise, and Williams' Bon Chretien are the only varieties that have given favourable returns this season, but we do not grow many sorts.—J. CLARK, *Wemyss Castle Gardens.*

WORK FOR THE WEEK.

WARM ORCHIDS.

WE have now reached the decline of the year, and many of the warm orchids in different sections are rapidly terminating their season's growth, some having already completed it. Taking the season throughout, one cannot say it has been a very good one, and yet it has not been a bad one for orchids. In some of our large collections we always find certain warm orchids have grown better than others, yet without special treatment; it thus behoves growers to well study such cases and endeavour to find the cause for their own benefit. Phalænopsis will have attained their full leafage; these orchids enjoy strong shading in the summer months, especially in exposed houses. Early in the year advice was given to afford shading both inside the house and outside, the outer to be used with discretion, and the inner to remain throughout the growing season. The time of the year has arrived when the shading must again have attention, and if at various periods during the growing season too much shade has been given and the leaves are very sappy, proper care and attention will now bring the matter right. The moisture must be gradually decreased, and the inner blinds must be taken down, though it would be well to take the top half down first, and the remaining half in another week; no more syringing will be required, as the present time is a very critical one. The bottom ventilation must receive every attention, and fluctations of temperature must be strongly guarded against.

Dendrobium atro-violaceum having been recently imported, many growers will be able to purchase a few plants, this being such a pleasing orchid, and, without doubt, well worthy of cultivation. Thoroughly examine each plant to see that nothing in the way of beetles or insects are lurking in or among the stems. Well wash the plants in lemon oil or some other insecticide before placing them along with the other occupants in the warm-house; the species will require plenty of heat all the year round, and especially at the growing season. Some of the plants are pretty well advanced in growth, and these should be placed in a strong heat. Others that are not showing growth should be kept quiet for the winter, and started early in the coming year, as this will allow them a long growing season. Indeed, it is far better to adopt this plan than to force a small weak growth in the short time left this year. Odd plants of Cattleya aurea and C. gigas that finished their flowering season early, will be sending forth new roots, and if any attention in the way of potting is required, this may be given. Great care must be taken in the watering, keeping the compost rather dry. Cattleyas of all sections will require to be well watched at this time of the year. C. labiata will be coming into flower in many collections, in fact, many are in full flower. Water must be given sparingly, and cold nights guarded against.

The temperature in different houses should range as follows:—East Indian house, 70 degrees by night; and cattleya house, 65 degrees. The day temperature must be regulated according to the weather outside. The dendrobiums should not have below 60 degrees of heat.—T. STAFFORD, *Tyntesfield Gardens.*

STOVE PLANTS.

INSTEAD of offering obstruction to the rays of the sun, which is customary during the hottest months of the year, the endeavour from now on through the winter should be to afford the plants in stoves all the light possible. With this object in view all roof climbers should be well thinned out; in the case of stephanotis that are planted out in beds, and, therefore, cannot be removed, as much of the old wood should be removed as possible, also any superfluous shoots of the current season's growth, reserving the strongest and best ripened of the current season's growth to furnish the wires for the first crop of bloom next spring; these shoots may be tied loosely into small bunches and looped to the wires over the pathway. Allamandas must be freely thinned out, and the remaining shoots shortened, but on no account finally pruned until they have been brought to a state of rest. Aristolochias, passifloras, bougainvilleas, and, in fact, all roof plants may be freely thinned, and afforded a gradually reduced water supply until they are brought to a complete state of rest, when they may receive their final pruning. The roof glass and woodwork should also receive a good washing with soft soap and water to get rid of all the green matter which generally forms so freely, owing to the close, humid atmosphere. Thoroughly wash the gravel on the stages, or, if ashes are used, clear all out and replace with new, as by so doing much filth will be got rid of. Before re-arranging the plants, all should be carefully cleaned; crotons, ixoras, tabernamontanas, and plants of a similar habit may be syringed with or dipped into some good insecticide; eucharis, pancratiums, anthuriums, marantas, dracænas, &c., to be sponged, taking care during the operation that the leaves are not broken. When arranging them in position avoid that flat, even surface one so often sees, and break the outline by raising some, and here and there bringing a larger plant to the front; by such an arrangement the house is made far more pleasing.

If not already attended to, the poinsettias should receive a light top dressing, incorporating in the soil a little artificial manure. A few plants may be introduced into the stove for affording early bracts, but the bulk of the plants for the time being are better in a light house with a temperature of 55 degrees by night and 60 degrees by day; an occasional watering with soot-water will be beneficial, and impart that dark-green colour to the leaves which one delights to see. Again I would warn those who have the watering of these plants to attend to, be sure the ball of earth is thoroughly moistened through, and now and again a plant should be turned out to see that such is actually the case; if the roots in the lower part of the pot become dry, and remain so for a few days, the plant will quickly lose its lower leaves. The bracts of poinsettias are beautiful; but they are doubly so if the plants are furnished with leaves to their base. Plants of alocasia and maranta will now require less moisture; I do not mean to afford dribblets instead of a thorough watering, but to water at wider intervals of time; a position at the warmest end of the stove will be their best quarters for the winter. Young gardenias and ixoras that have filled their pots with roots should be shifted on. A position in the intermediate house will suit old plants of gardenias until such time as it is desired to push them on into flower. The tops of any leggy crotons may now be taken off and rooted, as these will root more quickly now than in spring, when the wood has become hardened. Put in another few pots of cuttings of panicum and fittonia; they will be very useful after the turn of the year. Aphelandras are now advancing to bloom, and should be placed where the syringe will not reach them; afford them stimulants regularly at the root. Eranthemums, linums, and reinwardtias should have a position at the cool end of the intermediate house; they will need to be regularly syringed to keep red spider in check.

Great care will now be necessary in ventilating the stoves, and more reliance will need to be placed upon the heating apparatus to keep up the necessary temperature on cold nights.—J. TUNNINGTON, *Ripley Castle Gardens, York.*

THE FLOWER GARDEN.

THE cold nights recently experienced have come as a reminder that all tender subjects should now be placed under cover or so situated that protection may be easily afforded on cold nights. Although the drought still continues the recent tropical heat has given way to a cooler air, and at this date frost is liable to occur any night. At the time of writing bedding geraniums are still finely in bloom, and subtropical plants, where water has been applied, are in good condition. One of the most effective flowering plants at the present time is the yellow Cassia corymbosa, a very useful subject for association with others in the subtropical garden. It is not injured by a few degrees of frost, and blooms most profusely in the autumn. The dry weather has been very trying for bedding calceolarias, and, unless water has been applied freely, young growths for furnishing cuttings will be somewhat scarce. Where these are obtainable the present to the middle of the month is a suitable time for inserting the cuttings for the next season's stock. These will be found to root more readily now than if inserted at an earlier date, especially in seasons like the present one. Young shoots with growing points should be chosen, rejecting those that show flower buds. The best position for striking these cuttings successfully is a cold frame set on a hard base of coal ashes, or something similar, on which some rough leaf-soil about three inches in depth should be placed, and over this three or four inches of moderately light soil previously passed through a half-inch seive. If the soil is heavy it should be lightened with sand and leaf-mould. The whole should be trodden firmly, allowing a slight slope to the front of the frame, and over the surface scatter a sprinkling of silver or sea sand. The cuttings should be inserted with a rather bluntly-pointed dibber, allowing a space of about three inches between each. The bed should be given one good watering after inserting the cuttings, and then all be kept close for a few weeks and shaded from bright sunshine until roots are formed.

Antirrhinums, pentstemons, and gazanias may be similarly treated, and strike readily at this date. If small quantities only are required pots or boxes may be used for the cuttings, and these stood in a cold frame kept close until roots are formed. Violas for summer flowering may be treated similarly to calceolarias, or if given a sheltered position on the open border they strike almost with certainty. The cuttings should be made from the young growths starting from the base and not from those that have borne a crop of flowers. The old plants may also be pulled in pieces and the youngest growths, with bits of roots attached, be pricked off on a border to stand until spring, when they may be transferred to the flower beds in March or April. Pink pipings, if inserted when advised, should now be in a good condition for removal to their permanent positions in the borders or beds, which should be duly prepared for them by digging in a dressing of rotten manure and soot. If planted in beds a space of nine inches asunder should be given. Pinks are suitable subjects for front lines or patches on the herbaceous borders or where the edging is of stone or tiles; they may be planted a few inches on the inside and be allowed to grow over and cover the same. The old white and Mrs. Sinkins are useful varieties for this purpose. The double-flowered violets should now be lifted from the open ground and be planted in frames. In many instances the clumps of these will be smaller than usual owing to the heat and drought experienced throughout their time of growth, and they may therefore be planted at a less distance apart; as a general rule, if the plants stand two or three inches clear of each other at planting time this should suffice. The frames in which they are to be planted should be raised well to the light, a good position being on spent hot beds on which the frames are placed, putting in them sufficient soil in which to plant the roots so as to bring the tops very near to the glass when the lights are placed on. A good watering should be given to settle the soil; give full exposure in mild weather. Beds of Marguerite carnations, so useful for prolonging the supply of these sweetly-scented flowers, should have some arrangement for protecting the blooms from wet and frost for a week or two if the flowers are prized for cutting. These do not lift well for transferring to pots, so a batch should be grown on outside in pots and now placed in a warm greenhouse temperature for carrying on the supply into the winter.—C. HERRIN, *Dropmore Gardens.*

HARDY FRUITS.

SINCE penning my last calender note we have had no rain to reach even the surface roots of the trees, with the result that most of the remarks I then made concerning moisture are now equally applicable, indeed, more so, as in light soils trees are suffering badly, some varieties having lost their foliage prematurely. Trees that are suffering will benefit by a mulch, as, without this, moisture evaporates quickly and is lost in a few hours. In many gardens it is usual to allow the trees to carry the wood made during the summer, as some growers think by so doing the trees are benefited. Space does not permit me to point out the importance of summer stopping, but there can be no question as to the advantage of removing shoots now, as this will cause the buds to swell up at the base of the growths left, will give the wood more light, and reduce the demand upon the roots. With newly planted trees more license must be given, and my remarks mostly apply to trees making a strong growth, and of course only these will now be shortened—not pruned to the proper distance. Watering recently planted fruit trees should not be overlooked, as upon the supply given now will mostly depend next season's crop, for as there are none too many roots the trees need assistance. No matter how small the fruit garden, it will repay the cultivator to grow the best trees, and now is a good time to select new material and to mark those not worth growing. There are generally some old and worthless trees, so it is a necessity to plant a few young ones yearly, that losses may not be felt. Many value an old fruit tree for its age and appearance, but it is useless if the fruits are so poor that they are not worth storing. Now is the time to purchase new stock, as the trees may be seen in a growing state, and though I fear planting may be later than usual this season, owing to the heat and drought, it will be well to prepare by selecting and by making the land ready at an early date for the trees when they are ready to lift.

A little advice on planting may not be out of place. Many mistakes are made by planting in the same spot that the old trees occupied. This should not be, as the soil is so impoverised that good results cannot follow. It may be at times necessary to plant on the same spot; if so, it is well to remove the old soil and replace with other, adding such aids as burnt refuse, wood ashes, old mortar rubble, and some bone-meal, the whole being made firm, so that the roots made are of a fibrous nature. Of course, what is termed maiden loam is not to be beaten as a compost for new trees; but it is not within everyone's reach, and to purchase it is not always feasible. The aids advised, however, will be of great benefit in ordinary soil. In heavy clay land road scrapings, mixed with mortar rubble and ground bones, make an excellent compost, and in places where small charcoal can be readily obtained, it is a valuable addition. By preparing the soil now it will be in better condition for planting, and the rainfall will make it more workable. I have not mentioned animal manures, and, indeed, this is best let alone, as young trees, with the usual attention to cultural details, are inclined to grow freely enough; animal manures are best used as surface dressings. On the other hand, I have, with poor soil, used spent manure to advantage. Old melon beds or old mushroom manure are excellent, and assist in building up good wood if not used in great quantities.—G. WYTHES, *Syon Gardens.*

AUDIT OF THE R.H.S. FRUIT SHOW OF 1898.

For the fifth year in succession we present our readers with an audit of the great fruit show held at the Crystal Palace. It will be seen from the analysis appended that the competitive display—the only part taken into account for the audit—was larger than in any previous year, except 1895, which was an exceptionally good season. The lateness of the present season is indicated by the appearance for the first time in our audit of blackberries, currants, raspberries, and strawberries, these being shown in collections of fruit. Another striking feature of the late season was the increased display of plums and peaches, the former being represented by 214 dishes as compared with 115, the next highest amount, in 1897; peaches were 96 dishes, sixteen ahead of the number shown in 1895, the previous highest. Two dishes of gooseberries were staged, and only on one other occasion, viz., 1894, had this fruit been staged in competition. More kinds of fruit were shown this year than at any other of the R.H.S. shows at the Crystal Palace; the number of kinds was 22, and the number of varieties 378, a total twice exceeded, viz., 411 in 1897, and 433 in 1895. Considering that two new sections were provided in the 1898 schedule, these affording an addition of forty classes, it cannot be said that the competition was so keen as usual; indeed, there was a falling off in the single dish classes, while we understand that the total entries were only three more than in 1897.

Lifting and Planting Fruit Trees.—At this period of the year it is usual to commence lifting any trees that are too gross in growth and unfruitful, and if the soil is in a moist condition I think the earlier the work is done with such trees as peaches and nectarines the better; and I also like to lift apricots early, as these trees bloom early. Unless moisture is given, however, the ground is far too dry at this date, and to avoid delay we are removing the surface soil and well watering several times before commencing the work. There is no gain in leaving these trees till the leaves have fallen; indeed, the reverse, as by lifting in October the trees make new roots at once, and it is an easy matter to syringe overhead early in the day, to prevent flagging after the trees are newly planted. Avoid undue mutilation of the roots, and where it is necessary to shorten strong roots this should be done with care, but in all cases keep a reasonable distance from the bole of the tree, so as to preserve the roots needed. With large pear and apple trees it may be well to defer lifting to an early date in November; but here I am in favour of doing the work as soon as the soil is in condition, and with young trees it is an easy matter to give sufficient moisture to saturate the soil, and ample supplies after the work is completed. Where top-dressings may be of service, a richer compost may be employed to encourage new surface-roots, but whether planting, lifting, or top-dressing make the new soil as firm as possible.—G. WYTHES, *Syon Gardens.*

EXHIBITIONS AND MEETINGS.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.

THE annual dinner of this, the only benefit society open solely to horticulturists, was held at the Holborn Restaurant on Wednesday, October 5, Mr. G. Bunyard, V.M.H., presiding over a large gathering of members and friends, those present including such horticultural celebrities as Messrs. N. N. Sherwood, J. H. Veitch, H. B. May, H. Weeks, J. Baker, G. Gordon, J. Hudson, S. Wythes, J. G. Veitch, S. T. Wright, J. G. Ingram, G. W. Collins, W. Nutting, A. Outram, R. Dean, &c. After a well served dinner the usual loyal toasts were proposed and acknowledged in the usual energetic fashion.

Upon rising to propose "Success to the United Horticultural Benefit and Provident Society," Mr. Bunyard read several letters from absent friends, notably one from the Rev. W. Wilks, who much regretted his unavoidable absence. The Chairman, in referring to a few facts relative to the society, stated that there were seven hundred and twenty-eight benefit members. There was no need, he thought, to prove the need of such a society, for they all knew a gardener's work was not of the easiest, and he was greatly at the mercy of the weather; in addition to this, some employers do not care to pay their gardener when he is ill or incapacitated He urged all those present to do their level best to secure a new member, either benefit or honorary, each year, for they must remember that members are continually growing old, and so new ones must be obtained. As an investment, as an old age fund, and as a benefit society, he knew of nothing better than the United Horticultural Benefit and Provident Society; this being so, he asked all to do their best to increase its prestige, and obtain instead of sixty-four new members, as in 1898, six hundred and forty new ones in 1899. Mr. J. Hudson, the treasurer, responded, and having thanked the chairman for his advocacy of the society, showed that the invested money per member was greater in the U.B. and P.S. than in any other benefit society he knew. He also showed that the society was worked at a minimum of cost, and a great deal of labour was given to it gratuitously. He urged that the society encouraged frugality and thrift, and this being so, he hoped a very large number of the young gardeners would join, and so enable them to soon register the thousandth member.

The toast of "The Honorary and Life Members" was proposed by the venerable Mr. Nathan Cole, who heartily thanked all those who had helped the society as honorary members, and remarked that nurserymen were such good supporters of the society. He also expressed the society's deep thanks to the three lady patrons, who had done a great deal to assist, and to one of whom the Convalescent Fund was largely due. Mr. James H. Veitch, who was well received, suitably responded, and expressed his regret that Mr. Sherwood had had to leave early. He suggested that all the foremen gardeners in the country should be approached on behalf of the society, and he felt sure that all these would be persuaded to join if the benefits of the institution were placed before them.

Mr. T. Winter proposed "The Visitors"; he trusted all such had thoroughly enjoyed themselves, and that they would do their best to assist the society by becoming members, and inducing others to join also. Mr. S. T. Wright, superintendent of the R.H.S. Gardens, suitably responded to this toast.

Mr. H. B. May, in a few brief, eulogistic remarks, proposed the health of "The Chairman," a toast that was received with enthusiasm, and drunk to the accompaniment of musical honours. Mr. Bunyard responded in a very feeling manner, thanking all for their kindness in drinking his health. A list of donations was then read, this being:—Mr. Garcia, £1 1s.; Mr. G. Munro, £1 1s.; Mr. J. Watkins, £1 1s.; Leopold de Rothschild, Esq., £1 1s.; Mr. J. H. Veitch, £3 3s.; an anonymous donor, £1 1s.; Mr. S. T. Wright, 10s. 6d.; Mr. R. Dean, 10s. 6d.; N. N. Sherwood, Esq., £5 5s.; Mr. Cox, £1 1s.; Mr. Pinches, 10s. 6d., to the Convalescent Fund.

The toast of "Kindred Institutions" was proposed by Mr. W. Roupell and ably responded to by Mr. J. G. Ingram, the secretary to the Gardeners' Royal Benevolent Institution, who stated that his society was now aiding a hundred and sixty-eight disabled gardeners or gardeners' wives annually, in addition to assisting in a smaller way the unsuccessful candidates for its pensions.

Mr. Richard Dean, V.M.H., gave "The Horticultural Press," remarking that the society was largely indebted to the gardening press for its present high position and widespread success. He considered high honour and praise due to the horticultural press for its outspoken remarks on behalf of all gardening charities and deserving institutions in connection with the profession. Mr. George Gordon, V.M H., in responding, alluded to the fact that the U.B. and P.S. owed its origin chiefly to the inventive brain of a former editor of the GARDENERS' MAGAZINE. He was glad to find the society duly appreciated the power of the horticultural press, not only as regards its printed matter but in having horticultural pressmen upon its governing body. He urged the members to keep in every possible way the claims of the society before the gardening public.

Mr. W. Collins (secretary of the society) presented the thanks of the gathering to the donors of fruit and flowers, a toast responded to by Mr. J. McKerchar. A very pleasant and highly successful meeting was brought to a conclusion at an early hour with "Auld Lang Syne." Songs, part-songs, and instrumental solos by the Lamb Brothers' Glee Club enlivened the proceedings.

DEVON AND EXETER GARDENERS' ASSOCIATION.

THE Devon and Exeter Gardeners' Association held its annual meeting the other evening, under the presidency of the Sheriff of Exeter, at the Guildhall, Exeter. The executive stated in the annual report that the society had amply justified its existence, and had shown itself not unworthy of the support of those interested in horticulture. Working on broad lines, the papers dealt with covered a wide area of knowledge on gardening and other kindred subjects. "The Qualifications and Duties of a Gardener," "How a knowledge of Botany is a Help to Gardening," "Pruning and the General Management of Fruit Trees," "Herbs, their Cultivation and Uses," were among the papers read during the past autumn session, and in one or two cases they were made more interesting by practical demonstrations. The last item on the syllabus was "Winter Flowering and Foliage Begonias," which was much appreciated by the members. Following the friendly supper at Christmas, the spring session was opened with a paper on "Himalayan Rhododendrons," by a gardener who had taken a particular interest in that rather out-of-the-way subject. The next was a valuable contribution on "Orchid Growing." "Four Years' Experiments in the Cultivation of Vegetables with and without Chemical Manures," by Mr. Shrivell, proved very interesting, and the discussion that followed showed that the members appreciated the [illegible]. An essay on "Potatos," by a member, "Variety in the Flower Garden," by Mr. Moorman, and an eminently successful paper on "Summer Bedding" [illegible] a close a most successful session. The summer excursion was held at Endsleigh, near Tavistock, through the kindness of his Grace the Duke of Bedford. These excursions are very much enjoyed, and prove to be of a high educational value from a gardening point of view. An excellent programme has been arranged for the coming session.

On the motion of the Sheriff, seconded by Mr. J. T. Rogers, the report was adopted. The hon. treasurer's report showed a balance in hand of £13 11s. 3d. Mr. Pincott moved the adoption of the report, and said the association owed a great debt of gratitude to Mr. Mackay for the admirable manner in which the accounts were kept. Mr. Andrew seconded the motion, which was adopted. Mr. Hope moved that Mr. E. A. Sanders be re-elected as president of the association for the third year. Mr. Osman seconded the motion, which was unanimously adopted. Messrs. Hope and Mackay were re-elected hon. secretary and treasurer respectively, Mr. Osman, who proposed the motion for their re-election, remarking that the members might feel confident that the affairs of the association would be thoroughly managed by such officers. The committee were elected as follows: Mr. W. Andrews, Mr. W. R. Baker, Mr. G. C. Crabbe, Mr. J. Lacon, Mr. J. Rodgers, Mr. S. Radley, Mr. J. T. Baker, Mr. W. Charley, Mr. F. Edwards, Mr. J. Luxton, Mr. W. Rowland, and Mr. J. Weeks. The meeting terminated with votes of thanks to the officers, committee, and chairman.

MARKETS.

Covent Garden.

THE supplies of fruits and vegetables are moderate, and there is a steady business at the prices quoted. There is a tendency to rise in the prices for the best green vegetables.

FRUIT.—English apples, 3s. to 10s. per bushel; English grapes, 10d. to 2s.; Channel Island, 6d. to 1s. per lb.; Almeria, 9s. to 15s. per barrel; Lisbon, 6s. to 9s. per case; English pears, 4s. to 9s. per bushel; French Williams, 2s. 6d. to 4s. 6d. per box; plums, 3s. to 5s. 6d.; damsons, 2s. 6d. to 3s. 6d. per half-sieve; blackberries, 2s. to 2s. 3d. per peck; bananas, 5s. to 10s. per bunch; English tomatos, 2s. 6d. to 4s.; Channel Island, 2s. to 3s. per 12 lb.; green figs, 9d. to 1s. 6d.; peaches, 1s. 6d. to 6s. 6d.; nectarines, 2s. to 8s. per dozen; walnuts, 3s. to 4s. per prickle; Spanish melons, 4s. 6d. to 7s. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 2s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 3s to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. 6d. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Valencia onions, 5s. to 6s.; Ports, 5s. to 6s. 6d. per case; Dutch picklers, 2s. to 2s. 6d. per bag; marrows, 5s. to 8s.; cabbages, 4s. to 7s. per tally; eschallots, 1s. 3d. to 1s. 9d; mushrooms, 5s. to 8s. per 12 lb.; endive, 1s. to 1s. 6d.; cucumbers, 2s. to 4s.; cauliflowers, 1s. to 2s. per dozen; beans, 4s. to 5s. per bushel; turnips, 2s. 6d. to 3s. 6d.; carrots, 2s. 6d. to 4s.; parsley, 1s. 6d. to 2s. per dozen bunches; Brussels sprouts, 2s. 6d. to 3s. per half-sieve; lettuce, 1s. to 2s. per score; celery, 10s. to 18s. per dozen rolls; potatos, 55s. to 90s. per ton.

Borough Potato Market.

There are moderate supplies, and these together with the steady demand keep prices firm. Beauty of Hebron and Snowdrops, 3s. 6d. to 4s.; White Hebrons, Early Puritan, Sutton's Early Regent, Reading Giants, and Imperators, 3s. to 3s. 6d.; Black Lands, 2s. 6d. to 2s. 9d. per cwt.

The mean reading of the Barometer during the week at Greenwich was 29·80 inches, and that of the Thermometer 52°·9, the latter being 1°·7 below the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 17 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 42·4 hours. The measured rainfall amounted to 0·16 of an inch.

UNITY IS STRENGTH may indeed be said with regard to Holloway's Pills and Ointment, for when used together, they are remarkable in their effects upon disease. No matter how stubborn the symptoms may be, they cannot long withstand these remedies. All sufferers, whom other treatment has failed to relieve, should try the celebrated Ointment, which will strengthen and cure them. The Pills recommend themselves to the attention of all sufferers. No injurious consequences can result from their use; no mistake can be made in their administration. In indigestion, confirmed dyspepsia, and chronic constipation, the most beneficial effects have been, and always must be, obtained from the wholesome power exerted by these purifying Pills over the digestion.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Caterpillar on Roses.—G. F. B., Ellesmere: Judging from your remarks, the caterpillars have done little damage to the roses, and are so few in number that hand picking will suffice to speedily extirminate them. What the species is we are not able to definitely state, for when the packet was opened there was no caterpillar to be found, though its chrysalis was there in a deformed condition. It probably represents the Magpie moth (*Abraxus grossulariata*), or a closely allied species. Look for chrysalids in the surface soil and destroy them.

Stachys lanata.—S. R., Harrogate. The plant is one that was used extensively during the time that summer bedding was quite a rage; it has, however, become quite lost to many gardens, while in others a plant or two struggles for existence and its name is almost forgotten. It is perfectly hardy and is also very useful for a permanent edging when treated properly. To keep it in condition it must annually be lifted, pulled to pieces and replanted during the spring, as only by this means can it be kept dwarf, neat, and free from flowering. If allowed to remain untouched it becomes straggling during the second season of growth and runs to flower. There will be no difficulty in increasing the plant in the spring, by division; plant every piece separately.

Campanula pyramidalis.—C. W., Bath: We presume you refer to pot culture. Sow seed in April, using shallow boxes or pans of light soil and placing these in a close frame until the seedlings are well above the soil. Prick off as early as possible into pans or boxes and keep the tiny plants as near the glass as possible so as to prevent drawn growth. Pot the plants into five-inch pots about the end of June and give another shift early in August, as seems desirable; the plants may be kept in five-inch pots during the winter and be potted on in March, and this ensures their flowering the same season, though they would not be so large as specimens left to grow during the second summer. Plenty of air must be given the young plants. and soon after the first potting they may be placed in the open until winter begins, when the protection of a cold frame should be afforded. Potting compost should consist of good strong loam with a little mortar rubbish and wood ashes mixed with it.

Grouping Chrysanthemums.—A Yorkshire correspondent—W. B.—writes as follows: "I purpose competing at our local chrysanthemum show, in November next, in the class for 'a group of chrysanthemums, not to exceed fifty square feet; a margin of foliage plants allowed.' The groups last year were all arranged in semi-circles. I have a good lot of chrysanthemums, spring struck stuff, in six and seven-inch pots, each to carry one bloom. At what height ought the flower of the central plant in the back row to be above the floor? Should the blooms be wired to keep them from being snapped off, and if so what length and thickness of wire should be used? Should the pots in the back row be tilted a little, so as to present the face, instead of the side, of the bloom to the spectators, or would this effect be best obtained by wiring? Never having put up a group of chrysanthemums, I am desirous of obtaining such information as may assist to secure success." As the present offers a suitable opportunity for discussing the question of grouping chrysanthemums, we invite our numerous readers who are successful chrysanthemum exhibitors to send us their opinions of this matter, basing their remarks upon the questions asked in the above letter.

Scab on Apples.—H. C., Goole: The markings upon the fruits are caused by a fungus (Fusicladium dentriticum), known as Apple Scab. Not only does it injuriously affect the tree, but it spoils the appearance of the apples, rendering, in most cases, the dessert varieties unfit for table. A cure for this pest is to be found in a general cleaning of the tree or trees during the winter, removing all loose and rotten bark, moss, lichen, &c., so as to give the tree a better chance next spring; follow this with a spraying of a solution of carbonate of copper, also while the trees are dormant. In early spring, when the leaves appear, and before the flower buds expand, spray with Bouillie Bordelaise, and follow this with more sprayings at intervals of a fortnight, commencing after the fruit has properly set. The carbonate of copper solution is made as follows: Obtain one ounce of copper carbonate and enough ammonia solution to dissolve the copper. This may be kept in well-corked bottles until required for use, but it must be diluted with nine gallons of water. Bouillie Bordelaise or Bordeaux mixture you probably know how to make already, as the prescription has so often been given in our columns.

Herbaceous Plants for Exhibtion.—C. W., Bath: Soil and locality have such an effect upon plants, that what would prove best for certain gardens, would not prove so for others. The season you mention is also a rather extended one—six weeks at least—so that any dozen herbaceous plants suitable for July would not also be the twelve best for September. We append the names of a few of the subjects most popular with exhibitors of these hardy flowers: Delphiniums, pyrethrums, Heuchera sanguinea, Kniphofias, Lilium speciosum, L. candidum, L. umbellatum, Lychnis chalcedonica, Lathyrus grandiflorus, Centaurea macrocephala, Achillea ptarmica, fl. pl. The Pearl, Stenactis speciosa, Lathyrus latifolius, white and rose forms; phloxes, gladiolus, Helianthus rigidus, Catananche bicolor, Aconitum Napellus, Gaillardias, Alstrœmeria aurantiaca, Chrysanthemum maximum, Scabiosa caucasica, Coreopsis grandiflora, campanulas, &c. The fine two dozen bunches that secured first prize at Newcastle, July 13 last, were composed of three varieties of delphiniums, three of pæonies, four of irises, Dictamnus fraxinellus albus, Centranthus ruber, Lilium Martagon album, L. longiflorum, Thalictrum angustifolium, Gladiolus Colvillei The Bride, and G. C. delicatissima, Eryngium alpinum, Inula glandulosa, Aquilegia cærulea, Geum coccineum, fl. pl.; Gaillardia Penelope, Heuchera sanguinea, and Helenium Belangeri. If you intend competing, you will, to achieve any degree of success, have to start a herbaceous border, and plant a wide selection of useful subjects such as here given. There are plenty of others almost, if not quite, as good. We shall be glad to afford you any further information.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the members be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

S. R., Harrogate: Stachys lanata (see further reply).

J. Y., Southwick: The seed pod of a tree pæony.

R. E. T., Milborne: 1, a form of Tradescantia crassifolia; 2, Ananassa sativa variegata; 3, Begonia imperialis; 4, a cypripedium, send flower; 5, a garden variety of Begonia Rex; 6, Begonia sanguinea.

T. W., Ipswich: 1, Quercus Robur; 2, Osmanthus illicifolius; 3, Sciadopytis verticillata; 4, Cupressus Lawsonianus.

R. P., Bideford: 1, Hippophœa rhammoides; 2, Pernettya mucronata.

Names of Fruits.—G. S., Guildford: Yes; you might send No. 3 again, two or three specimens.

G. W., Calcot: 1, Dumelow's Seedling; 2, Beauty of Kent; 3, Baddow Pippin; 4, Beurre Diel; 5, Fearn's Pippin; 6, Lady Henniker.

J. H., Ascot: 1, Durondeau; 2, Beurre Bosc; 3, Beurre Diel; 4, Triomphe de Jodoigne.

G. A. G., Bournemouth: 1, Hollandbury; 2, Dumelow's Seedling; 3, Keswick Codlin; 4, Gravenstein; 5, Worcester Pearmain; 6, Ecklinville.

W. M. L., Haslemere: 1, Chaumontel; 2, Beurre Rance; 3, Waltham Abbey Seedling; 4, Peasgood's Nonesuch.

D. G., Sunninghill: 1, Cox's Pomona; 2, Duchess' Favourite; 3, Manks Codlin; 4, not recognised; 5, Fearn's Pippin; 6, Ribston Pippin.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

Tuesday, October 11.—Royal Horticultural Society: Committee meet at 12 o'clock; Demonstration at 3 p.m. by Rev. Prof. G. Henslow, M.A., V.M.H., on Some of the Plants Exhibited.

National Chrysanthemum Society, at Royal Aquarium; Three days. Conference on Chrysanthemum Rust on the first day, at 6 o'clock, in St. Stephen's Hall.

Saturday, October 15.—Liverpool Farmers' Club Annual Show.

AUCTIONS.

Monday, Tuesday, Wednesday, Thursday and Friday, October 10, 11, 12, 13, and 14.—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Rooms, Cheapside, E.C.

Thursday, October 13.—Surplus Stock, Messrs. Protheroe and Morris, Nurseries, Bagshot, Surrey.

Friday, October 14.—Imported and Established Orchids, Messrs. Protheroe and Rooms, Cheapside, E.C.

Nearly Every Day—Dutch Bulbs, Mr. J. C. Stevens, King Street, Covent Garden.

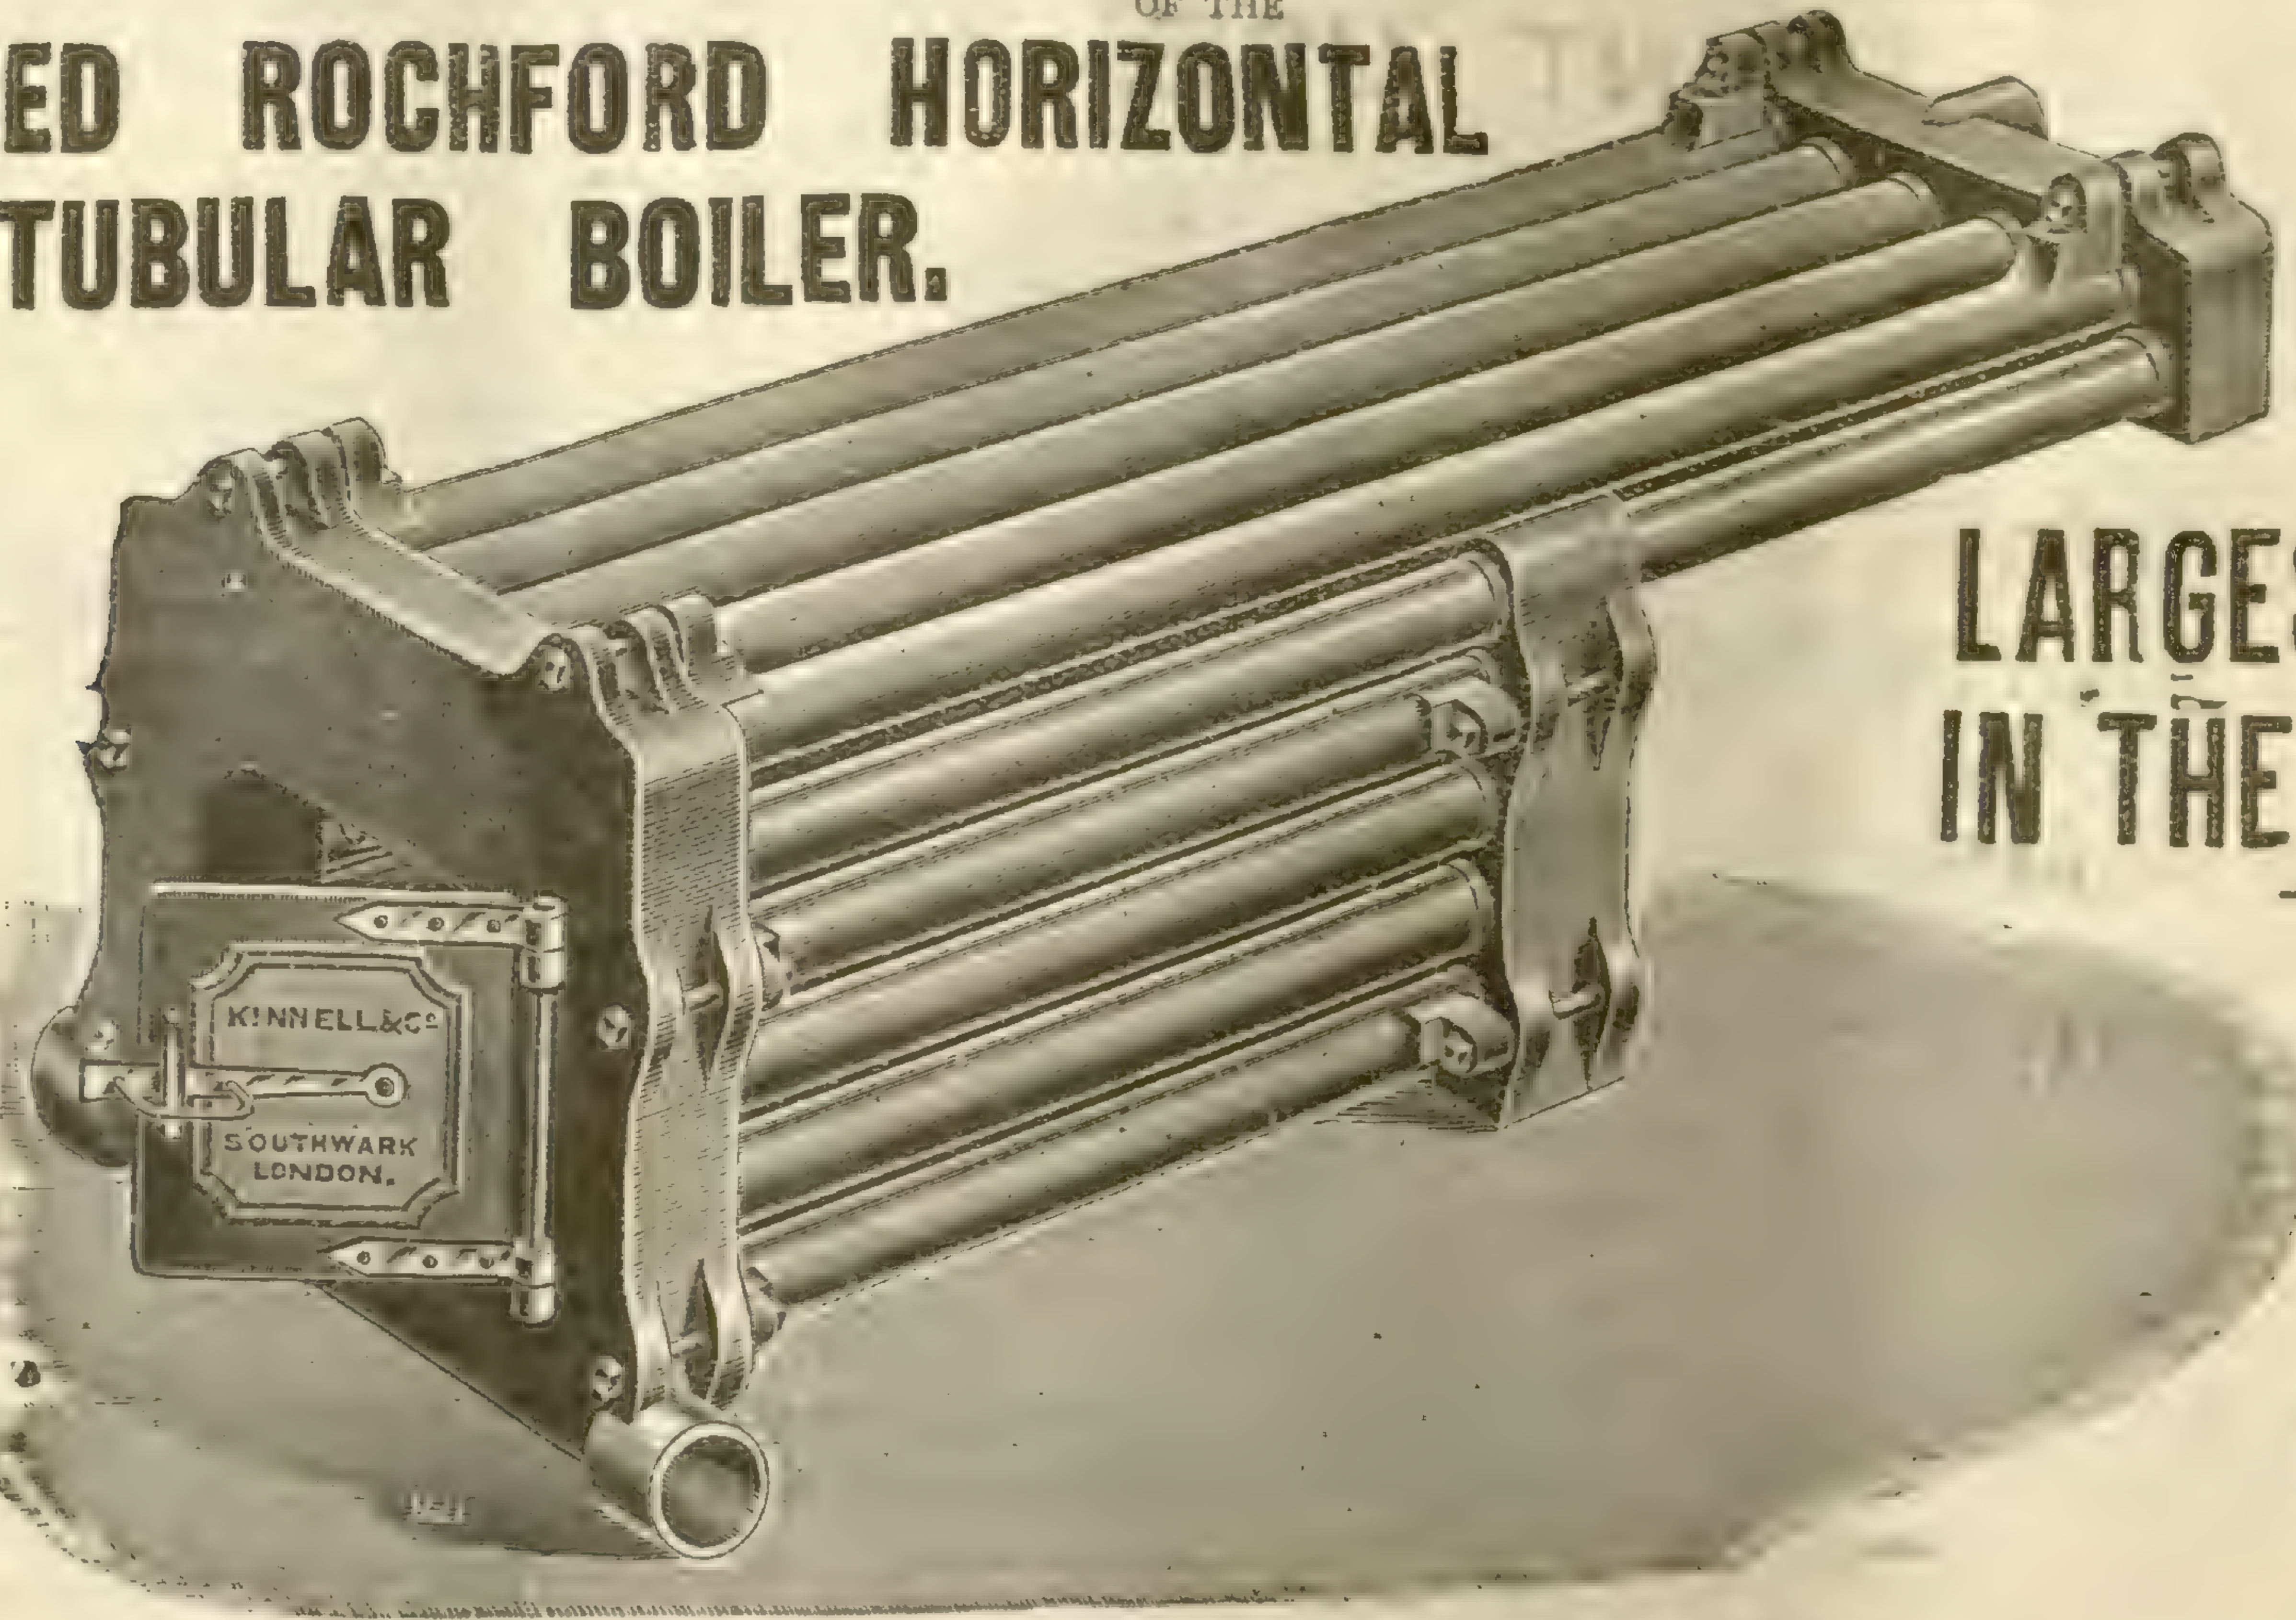
OF THE

IMPROVED ROCHFORD HORIZONTAL TUBULAR BOILER.

Specialities FOR Greenhouse Heating.



LARGEST STOCK IN THE TRADE.

ENGINEERS SENT TO ALL PARTS.

Plans AND Estimates Free.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.

To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.

Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

Offices and Warehouses, **SOUTHWARK STREET, LONDON, S.E.**

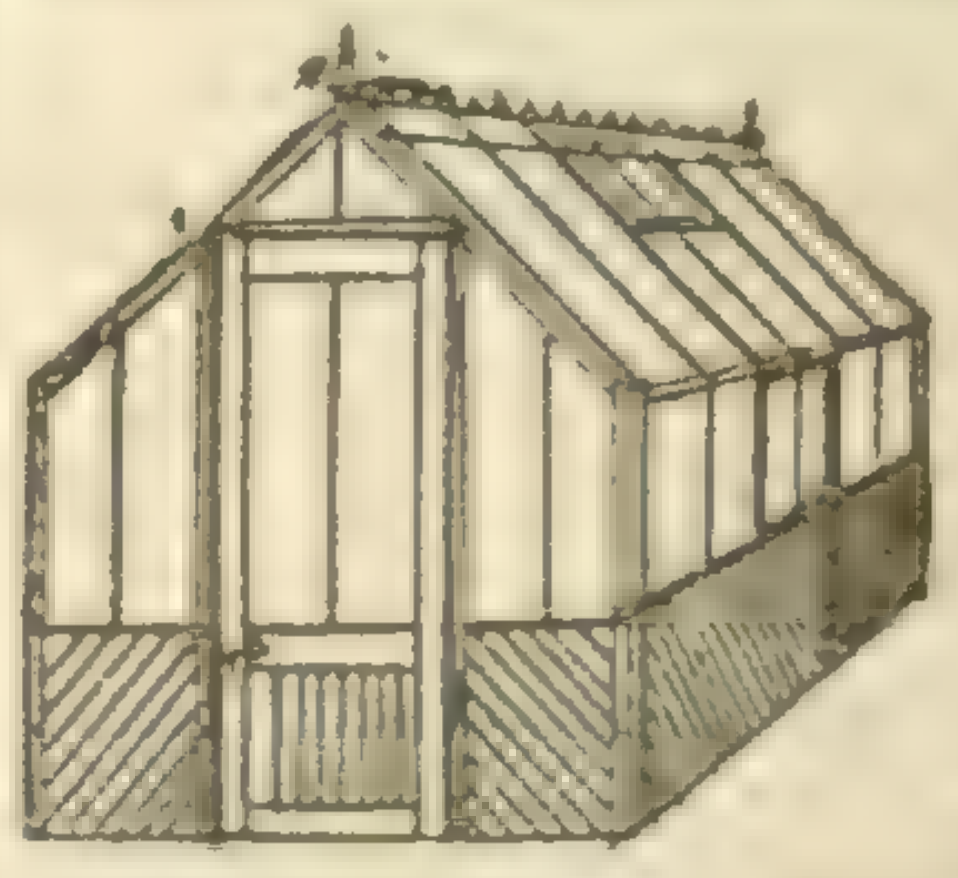
LAWN MOWER REPAIRS.—Having special Machinery and ample facilities for the repair of Mowers, we invite our friends to send their Machines needing repair through their Ironmonger or Seedsman, or direct to

SMITHFIELD IRONWORKS, LEEDS;
SURREY WORKS, BLACKFRIARS ROAD, LONDON.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

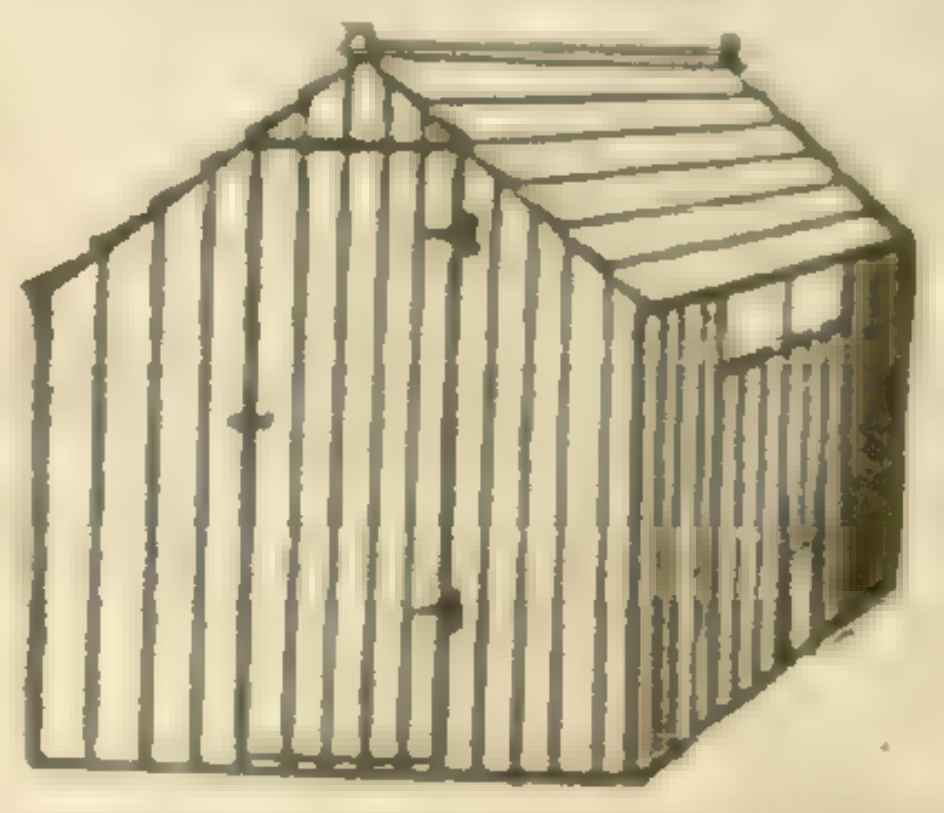


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	73/6
10 X 8	58/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£[illegible]	£[illegible]

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more.

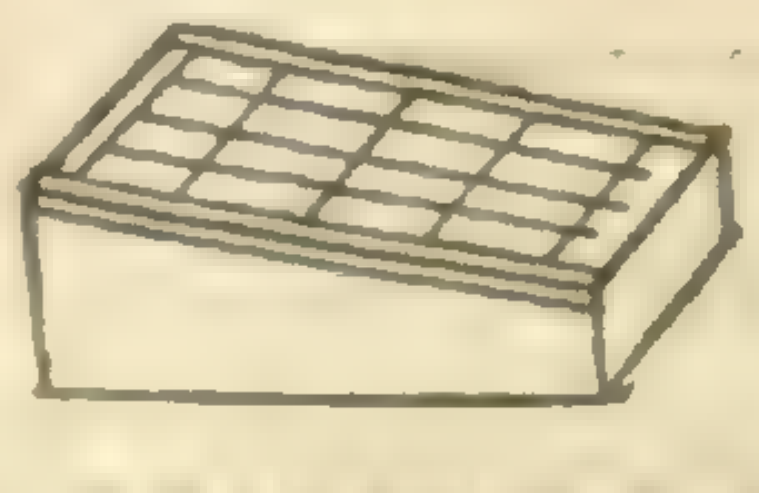
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to.	Span.
Ten	4 X 3	[illegible]	[illegible]
Twenty	5 X 4	12/[illegible]	1[illegible]
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	[illegible]

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.

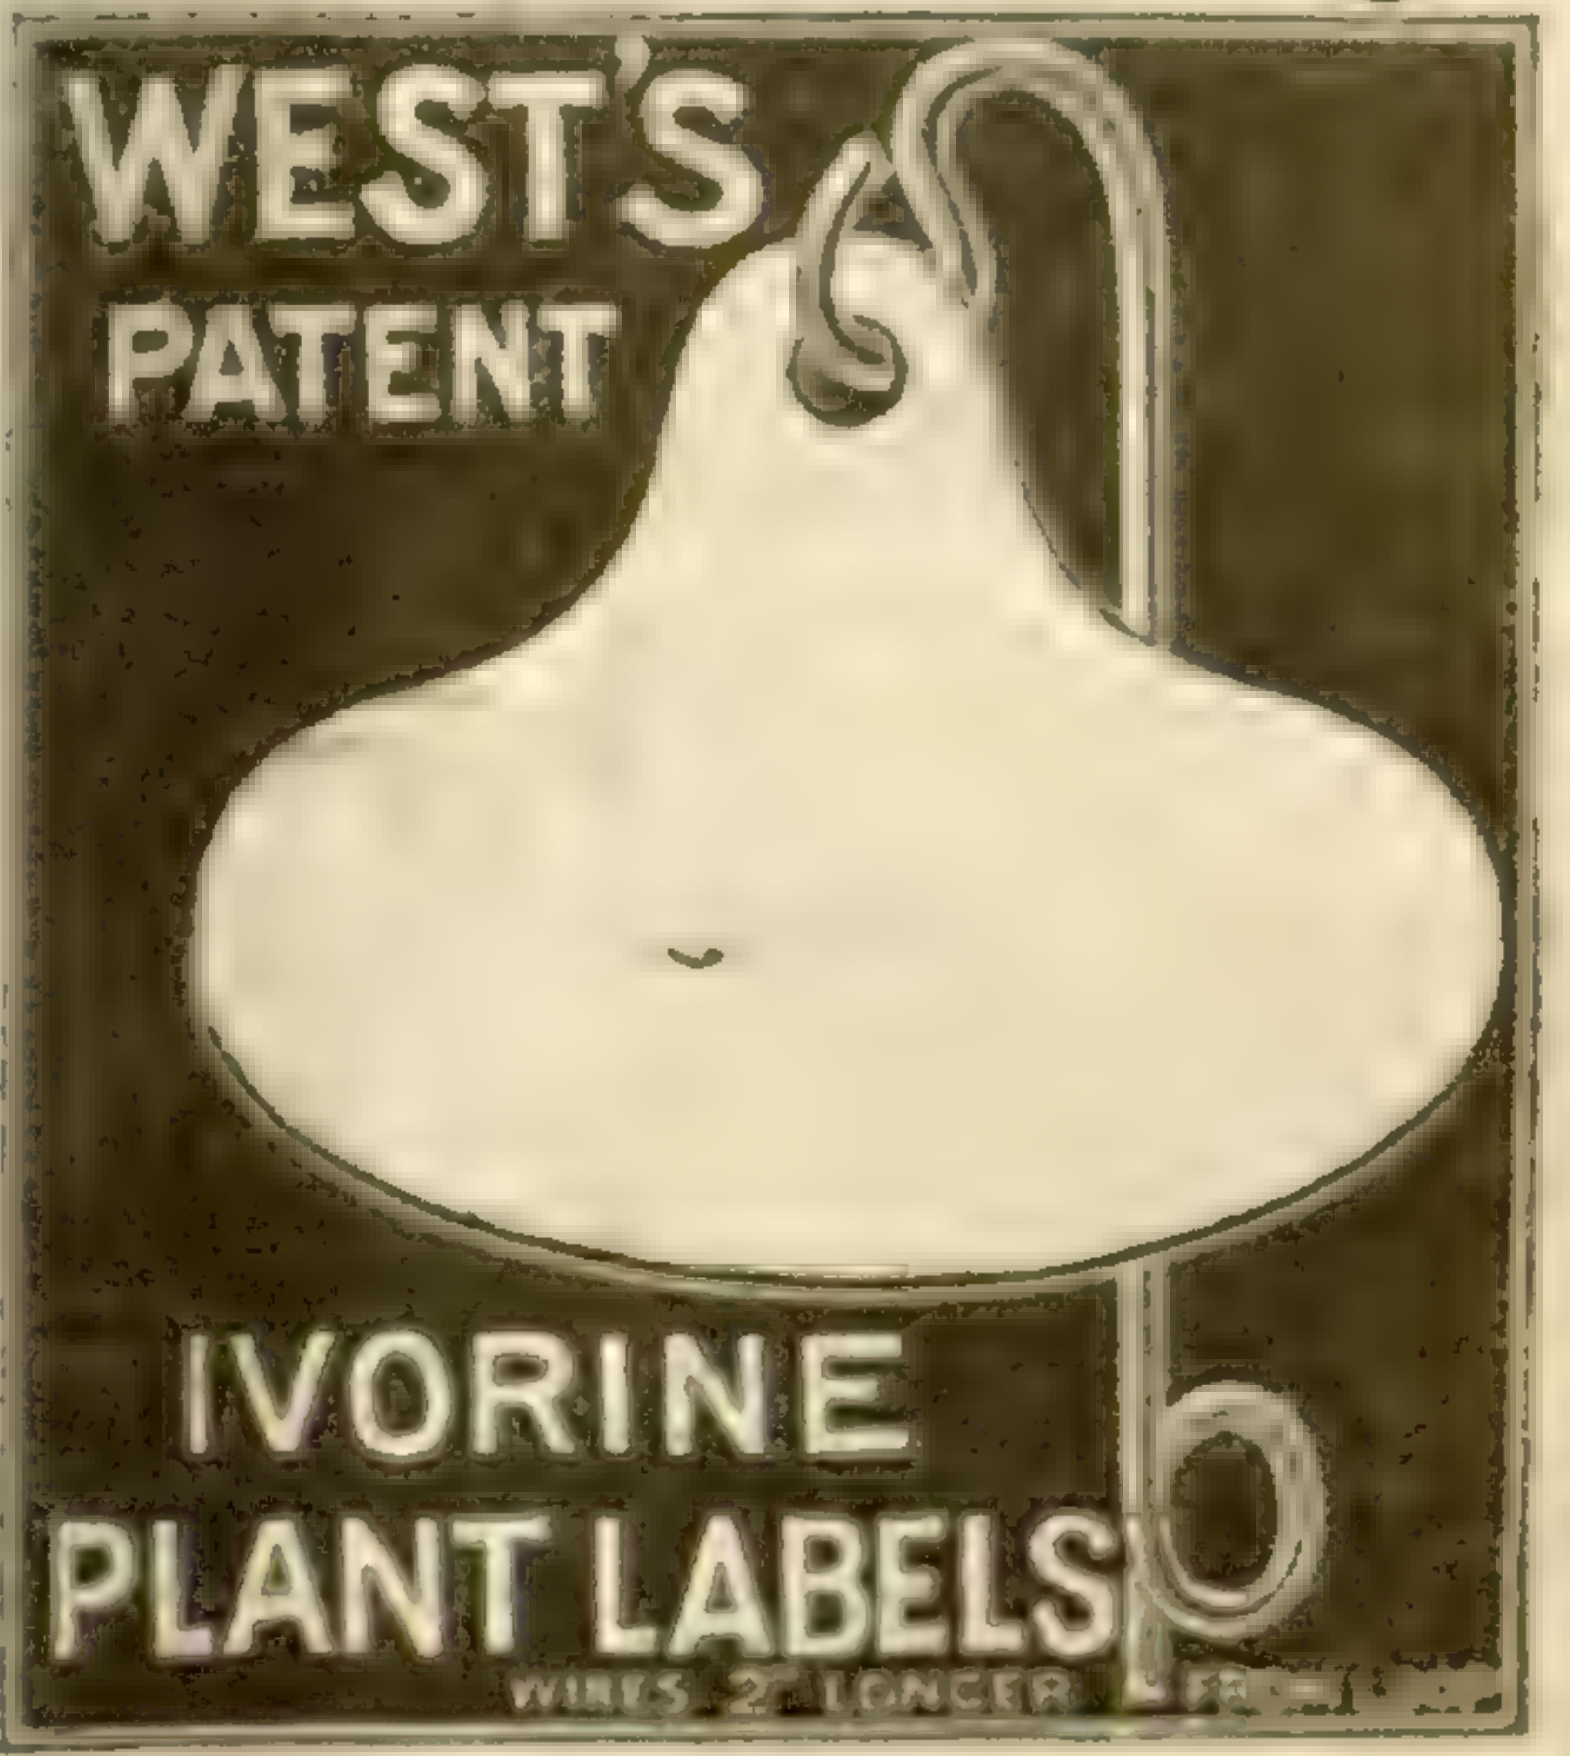


4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

Apply for List to—

HYPOLITE, DEPTFORD.



THE "IVORINE" WRITING DISCS, being made of a Celluloid and Xylonite composition, are imperishable, and don't corrode. Are pure white, so when written on show to perfection, and the writing is permanent though washable. It is for labelling all kinds of goods when with or without the shanks, and may be tested to withstand the weather by being immersed in water. Testimonial from the Royal Horticultural Society: "Your Labels have been tried at Chiswick, and found excellent."

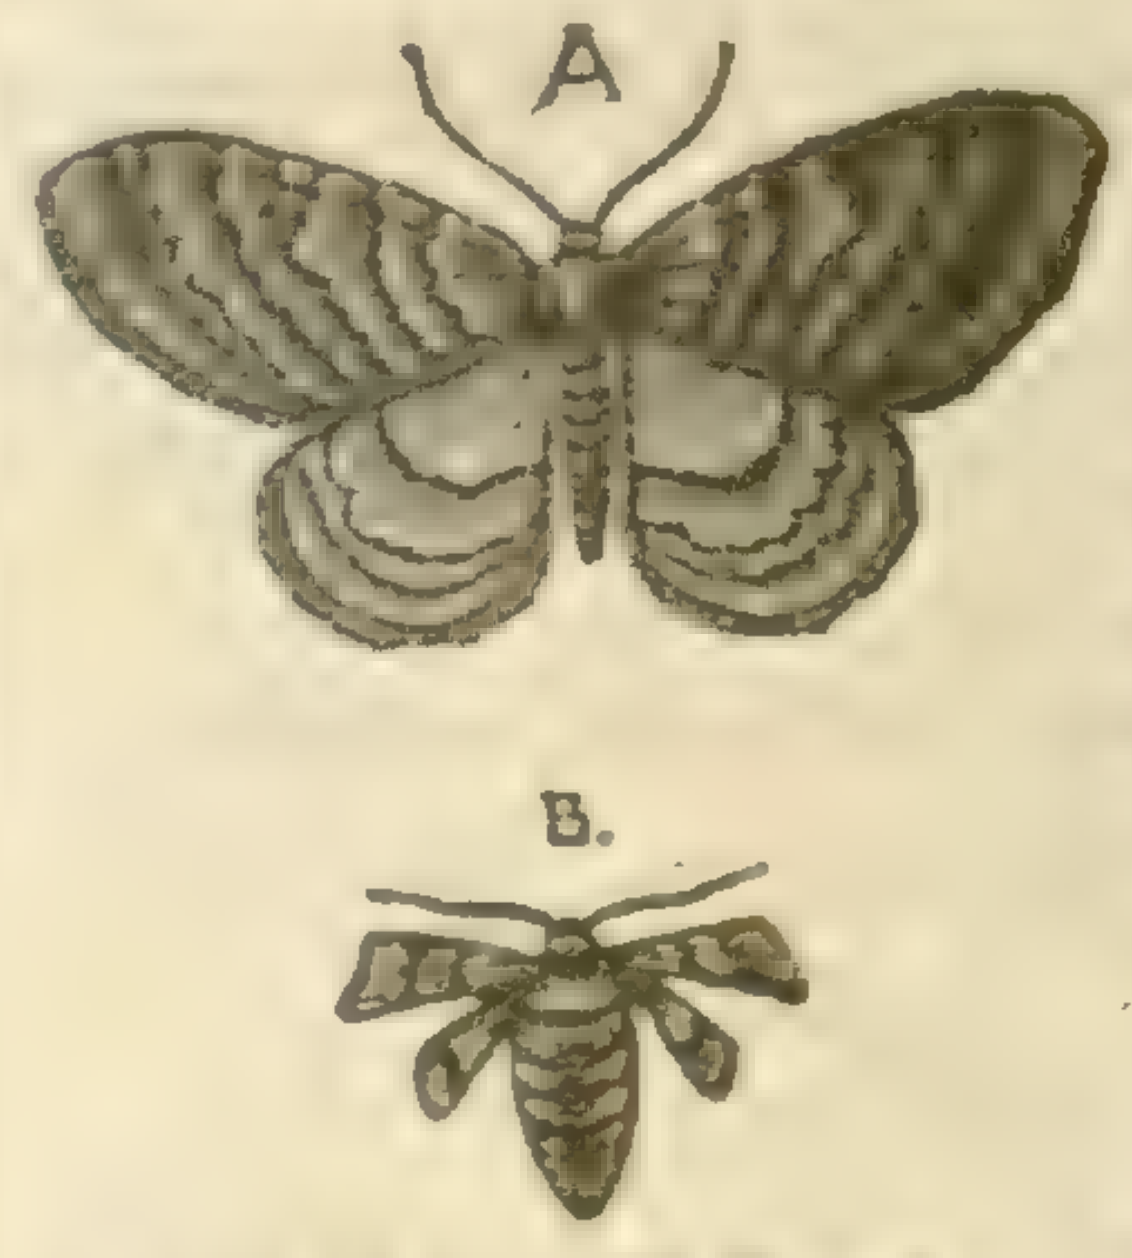
HORNE'S FRUIT TREE DRESSING

(INVALUABLE.)



(*a*) Male. (*b*) Female.

It has stood the test of eleven years as the best remedy known for capturing the Winter Moths. Thousands of pounds worth of fruit have been saved by its use that would otherwise have been lost if left to the ravages of the Caterpillar Pest. No time should be lost in ordering same, as the Moths appear early in October. Pamphlet free.

Please note the Tenth Annual Great Fruit Tree Sale of 220,000 takes place on the premises, October 11th and 12th; one month allowed to clear and settle accounts. Catalogues free of the Auctioneers, Messrs. Protheroe and Morris, 67 and 68, Cheapside.

W. HORNE, Cliffe, nr. Rochester, Kent.

PROFITABLE GARDENING.

By the late SHIRLEY HIBBERD. Illustrated Work on the Culture of Vegetables, Fruits, and other Garden Produce.

Price 3/6.

W. H. & L. COLLINGRIDGE, 148 & 149, Aldersgate St., London.

500 HOUSES IN STOCK TO SELECT FROM. WORKS OVER 5 ACRES.

LARGEST STEAM HORTICULTURAL WORKS IN THE WORLD. **INSPECTION INVITED.**

Our well-known portable Greenhouses and Conservatories are constructed in complete sections—the sides fixing to the ends with screws; the roofs made in proportionate parts, according to length of Houses, and furnished with suitable ventilators; and every part is carefully marked before leaving our works, thus affording facility for erection by any handy man, no skilled knowledge being necessary.

Where any purchaser desires a House erected complete by our staff, our charges will be found reasonable within 50 miles of London, beyond this distance, special prices will be quoted upon application.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

FUTURE OF THE NATIONAL CHRYSANTHEMUM SOCIETY.

THOSE of our readers who take an interest in associations that have for their object the improvement and extension of the culture of the chrysanthemum will not need to be reminded of the controversy with regard to the affairs of the National Chrysanthemum Society, which originated soon after last year's November exhibition. They will remember that the discussion was carried on, chiefly by members of the governing body, until the annual meeting, and that on this occasion the members instructed the committee to report to them, at a meeting to be held in November next, on the question of the place of holding the shows subsequent to this year. They have also been duly informed that in compliance with the resolutions passed at the adjourned annual meeting some five or six members were appointed to obtain the information necessary for the preparation of the report. This sub-committee has completed its inquiries, and it now remains to be said, that a notice has been issued convening a special meeting of the Executive Committee for Monday evening next, for the purpose of receiving and considering "a report from the Investigation of Sites Sub-Committee in reference to places in which to hold the exhibitions of the society in 1899." We are necessarily unacquainted with the contents of the report, and, we might add, cannot say whether it has yet been drawn up. But the purport of the proposed report has become generally known in chrysanthemum circles, and we are in a position to state that the removal of the exhibitions from the Royal Aquarium to Sydenham will be recommended; a change that should have the most careful consideration from the members of the executive in the first instance, and from the members themselves when the final issue is presented to them in a few weeks hence. So drastic a measure as the removal of the exhibitions from the centre of London to a suburb seven or eight miles distant, and involving a railway journey of between half an hour and forty minutes, is far too important to be accepted without very powerful reasons being given in support thereof. No doubt reasons that appear satisfactory to the majority of the members of the sub-committee will be given when the report is presented on Monday night, and these we await with keen interest. Arguments will, in all probability, be advanced with which we are familiar; and if none stronger are forthcoming, those responsible for the management of the society will have but one duty, and that will be to insist upon such proofs as will satisfy them that the change will be in the best interest of the society, before consenting to so important a change. The proposed recommendation must of necessity be considered, from a business standpoint, and in arriving at a decision it will be desirable for the members to consider whether the National Chrysanthemum Society would have grown from a small suburban organisation, not wholly free from financial difficulties, to the foremost chrysanthemum society in the world during its association with the Royal Aquarium had that association been what the agitators and faddists would fain have us believe. They should then consider whether it is to the interest of a large body of members to have to make an additional railway journey when visiting the exhibitions, and whether it will be an advantage or otherwise to an important section of the exhibitors to have imposed upon them an additional tax of time, strength, and money in the conveyance of their products to the shows. We have no doubt upon these points, and we shall be much surprised if the majority of the Executive Committee do not evince by their action on Monday a general agreement with our views.

CHILL OCTOBER.

ONCE again the whirl of the seasons brings us to the threshold of winter, which in this abnormal year of 1898 seems but a step from the blazing summer, so much has the sunshine prevailed to render the autumn a brief one. Once again, strolling round our gardens, we find a general shabbiness beginning to prelude the casting off of the leafy garments of the growing season, and although the heavy night dews, coming after the long drought, here and there start the checked growth into temporary activity, we know the winter sleep is close impending, and that the flicker of energy is wasted. To many minds, the shortening days, lengthening nights, advent of chilly breezes and frosty airs, and the consequent change in the face of Nature, have a depressing and saddening effect, though in point of fact this is as illogical as if the daily dip of the sun were so regarded. We live upon a revolving and rolling planet, which in its daily revolution alternately plunges us into sunshine and shade, and in its annual swing round the sun alternately gives us an excess and deficit of daylight over and under the happy medium of the equinox. All organic life has, through evolution, adapted itself to these conditions, and just as we, needing rest, pass the darkness of the night in slumber, rising refreshed the following day, so plants and many animals profit by the cold and dark season of the year to take their rest, and so prepare themselves for a fresh and vigorous growth when the advent of spring reawakens them. Viewed, therefore, as a preparation for this, the incoming of the drowsiness which is now pervading vegetation is seen to be but a prelude to a healthful invigorating sleep, and by no means the death which it mimics with bare branches and the litter of dead leafage—the cast-off clothes of the season. Autumn, indeed, has many charms. Deciduous trees, shrubs, and plants of all descriptions, though they cast off, as we have said, their leafy garb of the season, have a thrifty knack of emptying all the pockets, as it were, before they do so. The leaves are not suddenly cast off with their little cells full of living sap, by which the woody tissues could profit; all this is slowly withdrawn, and in the process the dark or light green pales and changes, and runs through a gamut of a score of tints before those little divorcing cells at the stalk's base decree the separation. Hence the woodland landscape, hitherto diversified with varied verdancies only, is now ablaze with all the hues of the rainbow save the blue, which heaven supplies liberally to fill the gap. Every gust of wind brings its little aerial maelstrom of fluttering leaves to the ground—yellow and pink and crimson and dappled and brown, and here the busy worm acts the sexton in conjunction with a very universe of insects and fungi, and speedily restores the shed materials to the ready roots for future assimilation. Under the ground, if we curiously dig and delve, we shall find exceptions to the prevailing sleepiness in the form of awakening bulbs already pushing out their slender white roots, after sleeping the summer through, to establish themselves for an early start in spring. Herbaceous plants are fattening up their crowns to the same end, and all the ripened fruits that have the chance are quietly burying their contained seeds among the *débris* of this year, to add their quota of new life to the resurrection of plant life in the next.

A GOOD INVESTMENT.

THE wages of the general body of gardeners are so low that, even with the most rigid economy, it is extremely difficult for those having an average income to make provision for sickness and old age, or for their families, should they die comparatively young. Hence it is of the highest importance the small sum annually available should be invested to the best possible advantage, and for this reason the report of the quarterly meeting of the United Horticultural Provident and Benefit Society, held on Monday evening, is of special interest. At this meeting the principal business was the consideration of the case of the oldest member, who, having attained the age of seventy, and being in failing health, was entitled under the eighteenth rule to an allowance from the Benevolent Fund. This member was one of the founders of the society, and has taken a part in the management throughout the thirty-two years that have elapsed since it was established. The committee, having taken these facts into consideration, unanimously resolved to grant him an annuity at the rate of 8s. per week for life. On attaining his seventieth year this member had standing to his credit in the ledger the sum of £80, from which he can draw according to his requirements. These facts cannot be brought too prominently before the gardening community, for no better investment could have been made than in this case, as can be readily shown by a comparison of the payments to the society with those required under the rules of the Post Office for the purchase of a deferred annuity. During the thirty-two years a sum of £2 1s. has been paid annually, and the benefits in return were a weekly sum of 16s. during sickness, until the scale of payments was increased to 18s. three or four years since, the return of the surplus profit on the attainment of the seventieth year or death, and a claim upon the Benevolent Fund throughout the whole period. Happily, in this case there was no occasion to draw sick pay. Had the member in question purchased a deferred life annuity of a similar value from the Post Office by annual payments, under the "money returnable" table, he would have had to pay about £3 annually, and would now have the option of obtaining the return of the money paid, equal to about £96, or an annuity of £20. On the other hand, as the result of his membership of the society, he has the sum of £80 at his disposal, and an annuity of £20 16s. What more need be said, except to express the hope that the member may long enjoy the annuity that has been granted him?

N.C.S. Conference on Tuesday was a splendid success in every way, and we have much pleasure in recording this fact because of the prevalent belief that conferences have had their day. Conferences might be made as popular at the present time as at any period in the history of horticulture, but they must be carried out on proper lines, and what these lines are was sufficiently indicated at the N.C.S. gathering. There must not be several lengthy papers of merely academic interest; but instead, short pithy addresses by men who are known to fully understand their subjects, and these subjects must be of current interest and admit of being briskly discussed. The subject selected for the chrysanthemum conference was abstruse, but it was of immediate interest, and, in consequence, upwards of three hundred persons mustered in St. Stephen's Hall to hear what had to be said about the fungus causing the disease of the chrysanthemum, known as the rust. This large number not only came to the conference, but the greater proportion stayed until the close of the proceedings, and this desirable result was brought about by rigidly limiting each speaker to five minutes, thus preventing tedious repetition by those who are not accustomed to speaking in public.

Strawberry Mildew.—Strawberry plants were seriously affected in many places during the past season by the strawberry mildew (*Sphærotheca pannosa*), a fungus which attacks first the leaves, causing them to curl and shrivel up, and then the fruits as they are forming. This disease makes its appearance in May, in the form of white spots upon the leaves. These gradually spread and cover the leaf-surface and extend to the fruit, covering it with white filaments, which may easily be mistaken for common mould. To casual observers the fungus appears to attack the fruit only as it approaches ripeness, when it spreads with astonishing rapidity; but this is due to the fact that it is not readily seen with the naked eye upon the fruit until the latter has coloured, but with the aid of a pocket lens it may be discovered upon the fruit in all stages. It is, however, most rapid and destructive in its action as the fruit approaches ripeness. This fungoid attack must not be confounded with that of Sphærella fragaria, which is confined to the leaves, nor with that of Glæosporium fragaria. In the case of plants infected by this fungus it is advisable to brush off the leaves as closely as possible without injuring the crowns, and to rake up and burn at once all the leaves and rubbish between the rows. The ground between the rows should be well forked and hoed in the autumn and early spring, to bury the perithecia, and weeds should be kept down, both in the beds and around their borders. After an attack in the previous year the plants should be sprayed early in the following season, before the blossom shows, with a weak Bordeaux mixture, composed of 4 lbs. of sulphate of copper and 3 lbs. of lime to 50 gallons of water, or with a composition of 2 lbs. of sulphide of potassium (liver of sulphur) to 50 gallons of water. In large plantations these compositions can be put on with the distributing machine used for spraying potatos, and in small beds with a knapsack machine. The spraying should be performed early, and repeated in about ten days. When white spots are seen upon the strawberry plants that have not been infected previously, spraying with either of the above compositions should be carried out at once.

The Polishing of Fruit.—With reference to this question, Mr. D. T. Fish makes the following pertinent observations: Your piquant "Note of the Week" in last week's GARDENERS' MAGAZINE should suffice, with the assistance of all respectable societies, to banish all such practices from flower and fruit shows. Your picture of dirty rags, oil, cream, and saliva, to which might be added butter, lard, and glycerine, as aids to prize winning, could they only be reproduced in *Punch*, or others of our comic journals, should suffice to deal the last blow at such nasty practices. I can conceive nothing more likely to bring fruit culture, and especially prize-winning at our great fruit shows, into contempt than these or other polishing compounds. It was bad enough to smear our old seeds with grease and oil, to dye our flowers, and revivify our plants or bulbs with the semblance of new life; but this modern nastiness thrust on the fruit that we must all perforce proceed to eat is worse than any of the processes and adulterations of the olden times. With our plants and seeds almost perfected, it is not likely that the public will longer submit to the most nauseous and filthy pollution of their fruits on the altogether false plea of improving its appearance. It does nothing of the sort. To every true judge of fruit polished fruit is already largely spoilt, the shining cheeks have already lost their chief charm—that of their natural bloom; and it would be almost as reasonable to wipe or scrub off the bloom of peaches, plums, and grapes as of apples and pears. Possibly the polishing of fruit is another useless and mischievous survival from the laborious practice of sweating it, once so common. When fruits sweltered for weeks or months in steaming heat it was at times at once cleanly and convenient to wipe off or up the perspiration with a clean, soft cloth. But no cream, oil, saliva, milk, nor even pure water, hot or cold, was added to the fruits in those days, nor was any rubbing that could be called a polish indulged in. The superfluous sap that false and faulty methods of storing and ripening fruit had condensed on the external surface was softly sponged or rubbed off with a soft cloth and a light hand, that was all. With improved methods and cooler and more regular temperatures for fruit storing the sweating of fruit is now prevented, and hence neither polishing nor wiping of hardy fruits is needed.

The Coming Trouble.—According to the calendar, we should, writes Mr. George Bunyard, of the Royal Nurseries, Maidstone, now be hard at work executing orders for roses, gooseberries, currants, trees, and conifers, and even lifting some few pears and plums for orders. But alas! the land is as dry as possible, and below the surface crumb is as dry as a brick, making all this work impossible; and meantime we are bombarded with letters, such as "I am told that now is the very best time for removing the things I ordered"; "If you are unable to supply what I ordered you should have said so at the time"; "Unless my order is forthwith executed, please consider it cancelled, that I may be better served elsewhere." Well! What for a remedy? Why *patience*. Practically the season is three weeks late, and as no fibrous roots can be got out of the hard soil, my kind friends, trust to your *nurseryman* to do his very best. Apples are yet in full growth, and practically a week's heavy rain is wanted before lifting time can be started. I send these few lines on behalf of myself and fellow-nurserymen, as we, I feel sure, are only too anxious to do our best, and are not responsible when the clerk of the weather and the calendar do not agree.

The Manchester Chrysanthemum Show, to be held under the auspices of the Royal Botanical and Horticultural Society of Manchester, in the St. James's Hall on November 17, 18, and 19, should be of exceptional excellence, for some handsome prizes are to be offered, notably £4 and a gold medal as first prize for two dozen incurved blooms in twelve varieties; £6 and a gold medal as a first prize for thirty-six Japanese blooms in not less than eighteen varieties; and £5, £3, £2, and £1 respectively as prizes for thirty-six miscellaneous blooms. The great prize for cut blooms, however, is £10 and a challenge cup valued at £25—presented by the Earl of Derby—offered as first prize for the best forty-eight blooms, two dozen each of Japanese and incurved varieties, distinct; second, third, and fourth prizes are £6, £4, and £2 respectively. The cup has to be won twice by the same competitor to become his property. There are good prizes for groups and winter flowering plants of many sorts.

The Yield of Perfume Plants.—A correspondent in *Gardening* (Chicago) states that in the south of France one violet plant will yield two-thirds of an ounce and one orange tree twenty-two pounds of flowers. A woman can pick in a morning, that is in four hours, about forty-four pounds of roses, seven pounds of jasmine, thirteen pounds of tuberoses, and in a whole day twenty-two pounds of violet or orange flowers. To produce one kilog. of essence (essential oil), one long ton, or about 1,200,000 orange flowers, are necessary. Sixteen tons of roses, or 5,000,000 flowers will only provide one kilog. of essence. Five hundred long tons of pomades and perfumed oils and 4,000,000 litres (or quarts) of odoriferous waters valued, as first matters, at over £625,000, are annually manufactured in the south of France.

A Botanical Exploration of Mount Koscinsko, the highest mountain in Australia, has been made by Mr. J. H. Maiden, the Government botanist at Sydney. The mountain has a height of 7,328 feet above the level of the sea, and even at Midsummer (January, 1897), the temperature was only 1·5 degrees above the freezing point at noon. In the list of the species gathered the most largely represented orders are the Rununculaceæ, Leguminosæ, Myrtaceæ, Compositæ, and Gramineæ. There are no species of Saxifragaceæ or Primulaceæ included in the list, and only one each is recorded of Crassulaceæ and Gentianaceæ.

Importation of Raspberries.—It is reported that the experiment of exporting raspberries from Canada to England will be made next year. The wild raspberries, of which the country produces great quantities annually, are to be used in the experiment, and they are to be packed in ten-pound tins. If this business can be made a success from Canada, says the *Rural New Yorker* there seems to be no reason why it should not be from America, and this may settle the question for some of our raspberry growers who have found the an unprofitable one during the past few years. If the American growers cannot find a profitable outlet for their raspberries in their home markets, they will certainly not do so in the markets of the United Kingdom, for fruit more objectionable than tinned raspberries cannot be conceived.

Chlorophyll Assimilation.—The leaves of maritime plants under the influence of sea-salt undergo a reduction of chlorophyll, acquiring by way of compensation a greater thickness and a more marked development of the assimilating tissues. But this modification of structure, although having a tendency to [illegible] the injurious action of the salt, is, according to Mr. E. Griffon, [illegible], since the assimilation per unit of surface is always less for the [illegible] of a maritime species than for comparable leaves of the same species growing inland.

Fruit Culture in Roumania.—In the recently published statistics of the areas and crops of the vineyards and plum orchards of Roumania for the year 1897, the total area of vines under cultivation is estimated at 380,000 acres, of which less than one-third was productive, the total yield being calculated at 5,491,860 gallons of wine, of the value of £302,000, or about 1s. 1d. per gallon. The cultivation of plums is an important industry in Roumania, chiefly on acccount of the national drink of the lower classes being a kind of plum brandy, called "tuica"; there were estimated to have been about 135,000 acres under cultivation in 1897, planted with plum trees at the rate of about 240 to the acre, but only 42,100 acres are estimated to have been productive. The yield was 1,251,000 bushels of plums, of the value of £130,708. These statistics show that the rains and floods of last year's season affected the vine-growing districts of the country to the extent of over two-thirds of the total area, the plum-growing districts having suffered to about the same extent.

Peppermint Culture has assumed considerable proportions in the United States of late years. Michigan leads all the States of the Union in the production of this aromatic crop. In 1897, it was estimated that there were 8,260 acres of peppermint grown in that State. Over 1,000 acres of this were grown by one man, Ex-Congressman A. M. Todd. In the same year, Indiana produced about 165 acres of peppermint, and New York 275 acres. The crop is not considered as profitable as it used to be. The chances are that, in the future, the culture of this [illegible] will be concentrated upon extensive farms where advantage may be taken of large appliances in growing and distilling the product. The total yield of the essential oil in America is estimated at 230,000 lbs. annually.

Chrysanthemum Shows in the London Parks.—Chrysanthemums in the parks under the control of the London County Council present a promising appearance, and the displays will be highly attractive when the flowers are fully developed. The parks in which exhibitions will be held are: Finsbury Park, opened on Saturday last; Southwark Park and Waterloo Park, opened on Thursday; and Battersea Park and Victoria Park to be opened to-day (Saturday.)

Grape Harvest in the City.—The remarkable summer we have just passed through has, says the *City Press*, been an unspeakable blessing to the amateur gardeners of the City. Never before have their efforts to make their window-sills and garden patches bright and gay been rewarded with so much success. One resident in Golden Lane has even had the good fortune to grow a [illegible] crop of really excellent grapes. He has made several attempts, but on each previous occasion has just failed to bring the grapes to maturity.

The Starlike Water Lily (*Nymphæa stellata*) has been much inquired after since the appearance of the excellent illustration that was given in the Gardeners' Magazine a few weeks since, and both Mr. Hudson and ourselves have received large numbers of letters relating to it. The majority of our correspondents appear to be under the impression that this beautiful blue water lily, which has been grown with so much success in an open tank in the Gunnersbury House gardens, is difficult to obtain. This, however, is not the case, for it may be obtained from any of the principal nurserymen, good plants being worth about half a guinea each.

The late Baron von Mueller.—The executors of the late Baron von [illegible] are endeavouring to raise a sum sufficient to defray the cost of the erecting [illegible] grave in the St. Kilda Cemetery, Melbourne, a monument worthy of his [illegible]. The monument is to be of grey granite, twenty-three feet in height, all [illegible], and will stand in the centre of a grave-plot twelve feet square, [illegible] specimens of the Australian flora. We learn also that the Baron [illegible] supplemental volume of the "Flora Australiensis," upon which he [illegible] for years, and was preparing for the press at the time of his death, [illegible], together with two volumes on his administration as director of [illegible] Gardens, Melbourne, and embracing a biography and complete [illegible] of his writings.

Bermuda, whence we receive immense numbers of bulbs annually of Lilium [illegible] Harrisi, is described by the American Consul in the island as being [illegible], but only a part of it is under cultivation, and some of this is but [illegible] tilled. Only about 3,000 acres of a total of 10,642 are under cultivation. [illegible] well cared for, the ground is capable of yielding four crops of [illegible] a year; but many of the cultivators are shiftless, and do not improve [illegible] opportunities. On estates where care and skill are exercised, great [illegible] attained. The principal exports are tomatos, potatos, onions and [illegible] which go to the United States. The last are the most important, [illegible] been stricken with a parasitic disease which has also attacked some [illegible].

T. S. Ware (Limited).—There has been a recent change in the firm of Mr. [illegible], of Tottenham, and this old-established business will be known in [illegible] the style and title of T. S. Ware (Limited). Mr. Brazendale, so long [illegible] of the Hale Farm establishment, will be the managing director of [illegible] company.

CONFERENCE ON CHRYSANTHEMUM RUST.

Under the auspices of the National Chrysanthemum Society a most interesting conference on the above subject was held on the evening of October 11, in the St. Stephen's Hall, Royal Aquarium. The attendance was large, and probably there were not less than 300 present when Mr. T. W. Sanders opened the meeting and called upon Mr. Percy Waterer to read a paper upon the

Practical Aspects of the Chrysanthemum Rust.

Mr. Waterer commenced by observing that the disease became evident mostly during the autumn of 1897, and it soon became evident that drastic measures would have to be taken to eradicate it. After referring to several diseases that the chrysanthemum suffers from Mr. Waterer briefly described the fungus as like tiny patches of snuff on the under and also upper sides of the leafage, this being followed by a discoloration of the foliage. White Swan, M. E. André, Australian Gold, Graphic, Mary Molyneux, and some others were stated to be varieties very liable to disease, while Edith Tabor and others were almost free, and the Davis family proved entirely free from the disease, so far as his observations went. Mr. Waterer said he also found the disease upon plum trees, dock leaves, and wild plums near his garden, and he felt sure that its presence there assisted chiefly in its distribution in his collection. He also thought the disease was propagated largely through the potting mixture by means of spores retained in leaf-soil, &c., and considered many of the myriads of spores produced escaped the rubbish heap fire, and continued the mischief. He tried to destroy the spores, but could not do so, even by paraffin, soot, brimstone, &c., and by a French decoction that was so abominable that it might even "Kill the devil at a hundred yards." He thought the chief methods of prevention would consist in keeping the ground clear of all harbouring plants, and frequent syringing with mixtures of any kind that would prevent spore germination. He advised that all fallen leafage should be burned and not allowed to accumulate.

With regard to the scientific side of the question Mr. Waterer confessed that he did not know much, but so far as his microscopical observations had gone he could scarcely corroborate what Mr. Massee had written in our columns recently with respect to the difference between puccinia spores and teleutospores. Mr. Waterer was attentively listened to and applauded at his conclusion.

The Scientific Aspects of the Fungus.

Mr. G. Massee gave a most interesting lecture, showing how fungi have cycles of existence, and that the point for the cultivator of plants attacked by fungi to discover what was the weakest spot in that cycle, and so break the connection and destroy his enemy. After detailing the life history of Puccinia Hieraci, as shown in the Gardeners' Magazine of October 8, Mr. Massee said that the fungus only, and naturally, did the best it could for itself, and its present widespread attack upon chrysanthemums was due to the fact that it had now found a new and congenial host upon which to grow, and it took advantage of the circumstance and lived a happy life. He said that the puccinia was parasitic upon almost all composites, and infested ten genera and thirty species of British plants. It was a well-known fungus, and no new thing, but it had found a new host. Gardeners were themselves very largely to blame for the spread of the disease because they, as a rule, knew so little of fungi growth that only when they saw the fruit or spores did they know the pest was present, whereas, as a matter of fact, the disease had been present for months. He showed how the puccinia spores were shed during summer, and these, falling upon a damp leaf surface, soon germinated, and in about a week were ready to produce fruit themselves; this method of reproduction continued until the chrysanthemum leaves began to undergo the chemical change inseparable from late autumn and winter, when the fungus—having to continue its species, and not having the means at hand for so doing as had prevailed during the summer—then produced teleutospores or resting spores, and these, falling anywhere, laid low until with the new growth of spring — under natural conditions—it had an opportunity of lighting upon its congenial host, germinated, produced mycelium that ran throughout the leaf tissues, and presently once again set up the puccinia-spore condition. Mr. Massee showed that the weak point in the fungus was that it produced no perennial mycelium, but was dependent upon suitable conditions for the germination of the teleutospores. He strongly advised that all decayed leafage be burned as quickly as possible, and that a house which had contained infested plants should be syringed out with sulphate of iron. Then in spring he advised methods of prevention, and showed that overcrowding should be avoided, while frequent sprayings with sulphide of potassium would effectually prevent any spores from germinating upon the surface treated. He contended that nothing would cure the disease, but the disease could readily be prevented. Mr. Massee was listened to with wrapt attention, and loudly applauded for his able and immensely interesting address.

Discussion.

After asking for brief speeches, the chairman threw the meeting open to general discussion of the question.

Mr. Wells, of Earlswood, considered a gardener could as readily destroy a fungus as he could produce a cucumber. He considered chrysanthemum rust was not a fungus. The fungus he thought quite a distinct affair. A tablespoonful of paraffin to a gallon of water was stated by Mr. Wells to be both a preventive and a cure for the fungus. He prescribed a remedy composed of lime, soda, soft soap, flowers of sulphur, and water, but we failed to catch the precise amount of each; this to be thoroughly syringed on to the infested plants over and over again. He did not consider the fungus would ever be a pest to be afraid of by growers, or that it would seriously affect the flowers produced by the plants attacked. Mr. Norman Davis felt that the more he grew chrysanthemums the more he found there was to know about them. Was it right that the spores could not be destroyed by fire? He thought rain water assisted the development of the disease, as the spores were distributed on the roof and then washed into the rain water tank. He had never seen the chrysanthemum rust until last year, and he thought the dry weather had been a means of distribution. He also thought the intercrossing had done much to weaken the constitution of chrysanthemums and so predisposed them to disease. Mr. T. Bevan remarked that a couple of years ago the fungus was raging in France, and he thought the pest might be an introduction from thence in plants or soil. Mr. H. Cannell showed that the disease needed certain conditions to enable it to propagate, and he thought the dry season was conducive to its increase, but that ordinary English summers would prove almost fatal to its general spread. Mr. H. J. Jones also spoke briefly.

Mr. Massee, in reply, said they were all agreed as to the existence of a fungus on the chrysanthemum, and he thought the theory of distribution by rain water from house roofs a most plausible one. As to the introduction of the pest from France, that was begging the question, as the pest existed in the field, common, and hedgerow, and in abundance, the hawkweeds being especially subiect to its attack, and thus we had the fungus at our doors ready to attack our chrysanthemums. In its native land the chrysanthemum was peculiarly enough free from the attack of this puccinia, but in its present cultivated condition the fungus found it a splendid host, and, judging from the wide area of attack, had made good use of its opportunities. He also stated that by careful attention the fungus might be kept in subjection. On the motion of Mr. George Gordon, V.M.H., a hearty vote of thanks to Mr. Waterer and Mr. Massee was passed. Mr. R. Dean moved a vote of thanks to the Aquarium Company for the use of the St. Stephen's Hall, and Mr. Cannell moved one to the chairman, this concluding the proceedings.

SCOTTISH HORTICULTURAL ASSOCIATION.

AT the recent monthly meeting held at St. Andrew's Square, Edinburgh, Mr. M. Todd, the able and genial president, presided. The exhibits consisted of several interesting displays of small flowering early chrysanthemums grown in the open air; these were shown by Messrs. T. Methven and Sons, Mr. Chaplin, St. Leonard's Park, and Messrs. R. B. Laird and Sons. Mr. A. Mackenzie, of the Warreston Nurseries, gave some interesting notes on these welcome and useful favourites. The president contributed some choice vases tastefully furnished with cut blooms; these consisted of a vase of gaillardias, one of pure white pyrethrums, a great improvement for decorative purposes over the choicest white asters, and a fine display of roses, chiefly the old General Jacqueminot, with a few pink and fuller coloured dark roses, that made a deep, choice mixture. As a groundwork for all these Messrs. James Grieve and Sons sprayed the table over with a fine collection of showy pansies, that gave a rich effect. With the election of the members nominated last month and the nomination of others the general business was concluded, and the president called on the secretary, Mr. R. Laird, to read the paper for the evening, "The Horticultural Press," in the absence of Mr. A. Galt, of London. There was a good attendance, close attention, and the paper occupied over three quarters of an hour. At its conclusion there followed one of the most earnest discussions that have followed any of the meetings of the association. Some members condemned the accounts of the daily Press as worthless, while others maintained that gardeners and nurserymen were indebted to the lay Press for many valuable suggestions. As your correspondent took a vigorous part in vindicating the power and the place of the horticultural Press, which is now well assured—whether we will or not—I will use the space at my disposal with a brief epitome of Mr. Galt's lecture without further reference to the discussion, only adding here, instead of at the end, that the business concluded with hearty votes of thanks to Mr. Galt, Mr. Laird, and to the President.

After a few general remarks on the power of the Press in determining the destinies of individuals, and of families, and of nations, the endless multiplication of books (the more the better, of good), Mr. Galt hastened to divide the Press into two sections—the lay, or general; and the special, or horticultural. Horticulture is essentially the industry through which we are fed and clothed. Horticulture is likewise an important science claiming relation with many other sciences, and has a close connection with mind as well as matter, though yet, as a rule, the lay or general Press has little to say about horticulture; and when it does voice its views not seldom makes mistakes, and is perhaps more amusing than instructive through being buttonholed at times by one or more cranks. It seems high time that most of our great dailies had one or more gentlemen on their staff able and willing to do justice to all matters horticultural. To the many other experts on our great dailies, surely it is high time to add horticultural experts, and that in their own interests as well as those of the public at large. There is no need for the general Press to compete with the special in copiousness, rather it should be truly accurate and truly educational, so far as it goes.

He considered it convenient to divide the horticultural Press into the following three divisions: First, the periodical Press, mostly weekly; second, books dealing with special subjects; third, trade literature, such as seed and fruit lists, catalogues, pamphlets, &c. The periodical Press is generally run, first of all, on sound trade principles. It is also a great and, in fact, the most potent educational agency among gardeners; it keeps them up to date in their information over the wide field of horticulture; and now we have a Press and papers to suit all classes and conditions of people, as gloves fit our hands. No trade or profession is better served with handy manuals and weekly papers than horticulture. Encyclopædias, popular compendiums abound, and some of them are being pulled up to date through new editions. Nicholson's "Dictionary of Gardening," "The Treasury of Botany," Thomson's "Gardener's Assistant," "The Fruit Manual," are but samples of useful books that abound, and that have proved companions and mentors to thousands of gardeners. Special books, manuals, genre to horticulture, crowd the highways and byeways of our craft on fruit, vegetable, and flower culture, ferns, roses, herbaceous plants, hardy and exotic plants, coniferous trees, shrubs, &c. Principles are also freely expounded, as well as sound practice taught, in all directions, and fully expounded as well as advocated through the Press; and, unless this is done, the gardener becomes the mere slave of his predecessors. Subsequently the Press quickens dull brains, fosters dullards into students, and presents each with a set of keys that virtually open the closed doors, he meets with in his everyday life, enabling him to find that what he reads has a direct bearing on what he does—the trivial round—the common task of his daily gardening.

The highly educational and other advantages of our greatly improved trade literature must be obvious to all. The descriptions of most of these are true to fact, the illustrations true facsimiles of Nature, and the cultural instructions the best available, contrasted with some of their survivors from olden times, we see borne fast and borne far; we have travelled in higher and better directions. Gardeners should make their wants known thoroughly by advertising, and perhaps this is best done by following the lead of an American journalist, who expressed it thus: "Let us know what you are doing." The effect of the Press on the individual appears, as we remember that nothing develops the individual like reading, neither is it true that only fools engage in Press controversies. Discussions often flash out new light, and all who engage in it often do become gainers. To make sure of our facts is our first qualification for Press work of any sort.

The influence of the Press on gardening as a profession has been to raise it greatly, and it has done not a little to raise wages, but the battle is not yet over, because it has not yet been won. Partly through having the educational standard of England pushed up to, or even beyond the standard of Scotland, Mr. Galt considered Scotsmen and Scotland had lost their almost exclusive monopoly of first-class situations in both countries; this is not that the northerner has not fallen away, but that the southerner has gone up. Mr. Galt concluded his paper on the Press with a reference to our Press advertisements, and a hearty commendation of the gardening charities.

D. T. F.

NEW PLANTS, FLOWERS, AND FRUITS.

DRACÆNA EECKHAUTI.

AN elegant dracæna having long recurving leaves of a deep metallic-green hue. The leaves are about fifteen inches to eighteen inches in length and scarcely more than an inch across at their widest part. A stately plant, and one likely to stand hard usage. A.M., R.H.S., October 11. Messrs. J. Veitch and Sons, Chelsea.

ALOCASIA SPECTABILIS.

A bold and effective aroid producing saggitato-cordate leaves measuring over eighteen inches in length by about ten inches in breadth. The mid-rib and its branches are very prominent and of a very pale green colour; the veins are greyish and show up clearly on the dark slaty-green ground. A.M., R.H.S., October 11. Messrs. J. Veitch and Sons, Chelsea.

SOPHRO-CATTLEYA CLEOPATRA.

A pretty and interesting orchid, but one bearing small flowers as might have been expected from such parentage, for it is the result of crossing Sophronitis grandiflora and Cattleya guttata Leopoldi. It is remarkable how little the cattleya influences the sophronitis. The flowers are barely three inches across and the petals are rather broader and more rounded than the sepals; the latter are bright, soft scarlet with a tinge of rose, while the petals have a deeper rose suffusion, lip narrow, side lobes palest yellow or cream coloured, tipped with red; central lobe, narrow rich rosy scarlet, stained at the base with bright yellow. A.M., R H.S., October 11, Messrs. Charlesworth and Co., Bradford, Yorks.

LINOSPADIX PETRICKIANA.

A neat little palm, which in the young state produces its fronds in quick succession; these are of a bright green hue, and the pinnæ are long, narrow, and very stout and leathery. This can scarcely as yet be called a graceful palm. F.C.C., R H.S., October 11. Messrs. F. Sander and Co., St. Albans.

ANGRÆCUM ICHNEUMONEUM.

A curious orchid, and one of more interest than beauty. It has stout leafage, and long depending spikes of palest creamy-green flowers that have by their curious shape gained for the plant the name of the Ichneumon Fly Orchid. B.C., R.H.S., October 11. Mr. Elphinstone, Shipley Hall, Derby.

LÆLIO-CATTLEYA HENRY GREENWOOD.

A splendid orchid, having long and rather narrow sepals of a pale lilac hue; petals pale lilac down the centre, but surrounded by a deep veining of bright purple. The lip is large, side lobes paler purple, but with their tips bright purple, this colour shading into the intense violet-purple of the broad and rather square-cut apec of the lips. The throat is bright yellow save for a few bright tints of purple. A.M., R.H.S., October 11. Messrs. B. S. Williams and Son, Holloway, N.

LÆLIO-CATTLEYA DOMINIANA VAR. LONGLEYENSIS.

A very fine form of a well-known hybrid, secured between Cattleya Doweana and Lælia purpurata. Whether the variation, noticeable in increased size and bright colour, is due to anything more than high cultivation, is perhaps an open question, but at any rate, the flowers were very fine indeed. The light purple sepals and petals form a grand setting for the rich crimson-purple lip. F.C.C., R.H.S., October 11. Messrs. J. Veitch and Sons.

DENDROBIUM RHODOSTOMA.

A pretty but somewhat sparse-flowered dendrobe, obtained by crossing D. Haltoni with D. sanguinolentum. The flowers are just over an inch across, the segments close together, white, with a tip of bright-red purple to each organ. The flowers are produced in twos and threes along the slender growth. A.M., R.H.S., October 11. Messrs. J. Veitch and Sons, Chelsea.

DAHLIA EBONY.

This is an exceptionally dark blackish crimson cactus dahlia with pointed segments; the central florets are a shade darker than the outer ones. A.M., R.H.S., October 11, Miss S. Mortimer, Farnham, Surrey.

CHRYSANTHEMUMS.

Crimson Pride is a very early flowering chrysanthemum, coming in to flower in September without any protection. It has large flat segments of a bright crimson hue, with dull gold shading, and streaking on the reverse of the florets. F.C., as a variety for cutting from, N.C.S., September 26. Mr. W. Wells, Earlswood.

Jules Mary is an early flowering Japanese variety of good habit; very free, and producing useful flowers of a rich and bright crimson colour, the reverse of the florets being old dull gold colour. A.M., R.H.S., October 11. Mr. W. Wells, Earlswood.

Rayonante is a charmingly light and elegant Japanese chrysanthemum, producing large blooms of a pretty soft rose-pink shade. F.C., N.C.S., October 11. Mr. H. G. Jones, Lewisham.

Soliel d'Octobre, a splendid soft yellow Japanese variety of fine shape and most pleasing appearance; florets of fan length and good breadth. F.C., N.C.S., October 11. Mr. W. J. Godfrey, Exmouth.

Reginald Godfrey, a handsome Japanese Chrysanthemum with rich but soft rosy crimson florets that are dull old gold colour on the reverse, this shade showing through in some cases. F.C., N.C.S., October 11. Mr. W. J. Godfrey, Exmouth.

APPLES.

Invincible.—This is a large, solid cooking apple with heavy but not prominent ridges, these forming a crown around the large, deeply-set, and closed eye. The stalk is small and slender, deeply inserted. Skin bright green, covered with tiny dots of russet, and having a bright red flush over the sunny side. A.M., R.H.S., October 11. Mr. D. Bodaly, Green's Norton, Towcester.

Mrs. John Seden.—A most interesting apple, and one obtained by crossing Transcendant Crab with King of the Pippins. The fruits are small, bright yellow, with scarlet cheek, and possessing a rather acid but nevertheless a pleasant flavour. A.M., R.H.S., October 11. Messrs. J. Veitch and Sons, Chelsea.

MELONS.

Wythes' Scarlet.—A richly-coloured and goodly-flavoured melon. The netting is light coloured and closely covers the dull yellow skin. A.M., R.H.S., October 11. Mr. G. Wythes, gardener to Earl Percy, Syon House, Brentford.

Gunton Scarlet.—A good scarlet fleshed melon of first-rate flavour; it is of medium size, and lightly but prominently netted over a golden-yellow skin. A.M., R.H.S., October 11. Mr. W. Allan, Gunton Park.

PLUM PRIMATE.

A large plum of a rich red colour heavily coloured with a soft bloom; the fruits are elliptic, and very fleshy. This is a very fine late plum for culinary purposes. A.M., R.H.S , October 11. Messrs. T. Rivers and Son, Sawbridgeworth.

LEAVES FROM A RAMBLER'S NOTE-BOOK.

CONTRASTS.

A REMARKABLE thing is custom, and one of the hardest to change, whether it be a concern of nations or only a small matter, having bearing on the habits of a few individuals. We get used to things, sights, and ways till they become to us like second nature, and we count anything different as strange and novel, though with those to whom such are a custom they are old and time-honoured. Before the days of railways and newspapers every district was a little world in itself, knowing and caring but little how matters moved outside its sphere, and following a routine of life that in time became general, and though the common free intercourse of modern times has done away with all that, yet the habits and customs then formed in different localities still remain, particularly with people who till the ground as a means of livelihood. Striking indeed are the contrasts that exist in the methods of cultivation and customs of the workers in the few hundred miles stretching from John o' Groat's to Land's End. In the case of professional gardeners it is not so much noticed, as they are a migratory class of men, drifting from one locality to another in probationary days, and if they are not fortunate enough to get a "life place," following up their nomadic existence to the end of the chapter. In this way gardeners become acquainted with many customs, and can have a knowledge of them all without becoming the slave of any one. Conditions of the soil, climate, and general adaptability to various crops have bearing on the customs of any locality in a marked degree. For instance, a district naturally suitable for fruit produces a race of fruit growers; in an arable neighbourhood everyone is more or less interested in corn growing, and in dairying localities the most important considerations are cows, butter, cheese, and so on. The condition of crops vary as much as the methods of growing them, according to soil and situation, which makes the contrasts of a half-day's railway journey all the more striking.

The country south of the Thames did not present a refreshing appearance during the early weeks of September. It was hot, unbearably hot, and people got tired of hoping for the rain that refused to come. For weeks there had been a continual slush, slush of water in gardens where there was a supply of that indispensable commodity, but, alas! in many cases there was a famine, and after waiting and hoping day after day for the shower that was to give the winter greens a start, and help the celery along, the former had to be put in without it. Some got as much water as could be spared, and after a struggle lived; others went without the liquid, and after a gallant attempt to keep pace with their more fortunate brethren, sickened and died. The lucky ones that pulled safely through the precarious time had other ills awaiting them, for which the drought must be partly attributable. When once they got a start, winter greens grew apace, and growers felt hopeful, but the enemy was lurking near. It was in the form of a plague of caterpillars that have played almost as much havoc with the greens as the British artillery did with Dervishes at Omdurman. Thousands were picked off and destroyed, but others filled the breaches, devouring as they went, and though now that we are in October, with the air cooler and nights frosty, we may expect to see the last of them, the winter greens are in a sad way. Whole plantations of Brussels sprouts, cauliflowers, and autumn cabbage present a pitiable appearance, there being little left but the stalks and midribs of the leaves. Celery has suffered from the ravages of the grub, and is anything but robust. Rain a few weeks ago would have made all the difference. Those who had water gave it, and the celery is strong and healthy looking, but we cannot expect much from plants that suffered from drought at the root, a tropical sun o'erhead, and hordes of rapacious maggots mining under the tissues of the leaves.

The harvest in the South was early on account of the sunshine and protracted drought. When sportsmen turned out on September 1 to shoot partridges, they were hampered but little with standing corn, and could walk the stubble with more freedom than they could get near to the coveys. Potatos also ripened quickly, and early in the month most of the garden crops were lifted and stored. The crops were not so large as was at one time anticipated, but the tubers came out clean and dry. It seemed early to be lifting late potatos, but they had done growing, and to leave them in the ground was only giving invitations to the disease. Onions were harvested at the end of August, and were generally a good crop. No beating down of the tops, or drying on inside vine borders was necessary, as Nature did it all. The tops withered and died while the bulbs were in the ground, and though they would have been bigger had there been more rain, still they are even and sound, and, what is more to the point, they will keep. A look round in September showed pastures parched and withered, and the green of the hop gardens changed to a dull brown. The pickers worked and sweated under a tropical sun, and they were amongst those who appreciated the fine weather, as hop-picking in a wet autumn is no joke. In the fruit plantations there was activity among the quickly ripening plums and damsons. Both crops were fairly plentiful, and growers of only odd trees felt the want of a local market, as the Kentish fruit industry is necessarily a wholesale one, and unless you have enough to make it worth while to send away, the chances of sale are small. London is the great centre, though distribution now extends to all parts, where the population is thick.

And now for the contrasts, even though comparisons are sometimes odious. The monster express engine slowly steamed out of the London terminus, and tore its way through shire after shire, by arable land and grazing land, at first in the fresh clear air and then in the smoky atmosphere of coal and iron fields, where vegetation seems to have a struggle for existence; then on again through a miniature forest of factory chimneys, and, after that, agricultural country again, till the long train slowed up and stopped, having left the metropolis one hundred and fifty miles behind. The first spontaneous expression was: "There has been more rain here!" and therein lay the first contrast. There were no hop gardens, no fruit plantations, and not many sun-dried pastures; but, on the other hand, mile after mile of green verdure, which was refreshing and pleasant after the burnt-up appearance of land in the South. Welcome rains after the hay season had set the grass growing again, with the result that meadows by their emerald appearance were easily distinguished, and the cows were browsing contentedly on the sweet herbage. We were in a dairy farming country, and there was activity at every station on the line. It was not with the loading of fruit, as had been the case at Kentish stations a few hours before, but another commodity going to supply the demand of London's millions, namely, milk. London is a mighty consuming medium, into which all parts of England pour their products, be they natural, animal, mineral, or manufactured, and the supply is never ceasing. The heavier rainfall in the midland and northern counties has had its effect in gardens as well as on farms. Greens for the winter supply looked healthy and robust, and what is more, were leaf-whole—a contrast favourable to the North. Caterpillars had done some damage, they generally do, but we noticed none of that mutilated, woebegone appearance which characterized the breadths of greens in the garden we had left behind. Celery, on the other hand, had suffered to about the same extent through the attack of the celery fly.

The enquiry about potatos did not bring a conclusive reply, and the reason was obvious on ascertaining the fact that most of the late sorts were in the ground and still growing, showing the crop to be several weeks later than in the South. There is a natural feeling of satisfaction in knowing that the crop of the indispensable tubers is safely lifted and stored, and when we thought of our clean, even samples, free from any speck of disease, and safely housed, and then turned our eyes to the breadths of half green and half black stems and leaves noticable in many gardens, well, we felt relieved that our potatos were as they were. The green was natural enough, and was waiting only for the ripening process to be completed; but the black told another story, and it needed not the eye of an expert to see that it was the result of the dreaded blight. "Oh, they're allright," said one grower; "the tubers are sound enough." My hopes were that they would turn out so, but I had my fears. Another contrast was noticed in the onions. In one garden a large bed of spring-sown bulbs had a green, healthy, upright appearance, but somehow I fancy that the inside vine border process of ripening will have to be called into use there. A man was busy bending over their stiff necks, and stared in profound astonishment when we casually remarked (with as little pride as we could show) that ours were harvested, roped, and were suspended at that precise moment from the beams in the store, except the two-pounders (the result of sowing a packet of Ailsa Craig under glass) which, for fear their necks might not be strong enough to support their weight, were accorded a position on the shelf. "I should think your's ain't a bad country for gardening," remarked the man as he applied the back of his rake to the onion tops more vigorously than before. I said nothing about the greens, as the quarters of healthy-looking Brussels sprouts and cauliflowers disconcerted me.

One could hardly draw comparisons as regards fruit, as the conditions are so much at variance. Fruit-growing is not a staple industry there, and the methods of cultivation contrast very unfavourably with the ways and customs of the South. Apparently, every farmhouse has its orchard of apples, plums, and damsons, but fruit generally was scarce. To all intents and purposes it did not seem to matter very much whether the apples cropped or not. It would have been interesting to know who planted many of the trees, and to have learnt something of their life history, as, judging by their patriarchal appearance, they have weathered many a storm. They seem to be there simply as an extra, as though, by some chance or other, they were planted in the first place, and since then have grown of their own free will. If they carry a crop, all well and good; and if they don't, it isn't a great loss. On one occasion I found myself in a damson district, where this crop is of considerable importance, though this season there has been very little fruit. For an area of several miles damsons grow everywhere—in gardens, orchards, meadows, and even along the hedgerows. The methods of distribution contrast very forcibly with those in the South, as, instead of sending away to large markets, the growers prefer to sell at home. Trade is therefore done with dealers who visit the locality, or the damsons are carted to the nearest town on market day. A farmer's trap, possessing a good deal more timber than spring, conveyed us to one of these interesting gatherings, where every agriculturist in the district seems to attend, either on business or as a matter of custom. The wide, open market-place and the straggling main street presented an animated appearance. From behind a row of canvas-covered stalls tradesmen shouted out the merits of their various wares, and along the curbstone were baskets of butter and eggs, poultry (live and dead), as well as apples, plums, damsons, mushrooms, and so forth, offered for sale from various receptacles. Buxom farmers' wives haggled with dealers over the price of the different produce until, by some unexplainable means, the market prices settled themselves, and were accepted on all hands as the standard charges. I cannot say much for the apples. They were a mixed medley lot, and not largely represented. There had evidently been no steps taken to grade them into sizes, or to keep the varieties distinct; and if they had to be taken as a sample of home-grown fruit I, for one, should be inclined to sink patriotic sentiments, and go for the Americans. Damsons were much better, the fruit being large and fleshy, and the price, owing, doubtless, to the scarcity, would have satisfied the most avaricious of Kentish growers. Still, the method of sale is precarious. Dairy produce, eggs, and fruit all go together, and it must be sold, as it does not pay to carry it back

H

HOMOLOGY OF PLANTS.

By Professor F. O. Bower, D.Sc., F.R.S

(Continued from page 653.)

III.—ABNORMALITIES.

AND now I may pass to my third point, and discuss more generally the argument from abnormalities. I have no wish to prejudge the question by the use of this term as applied to apogamy and apospory, or in any way to detract from their morphological importance—I merely intend to express that they are departures from that order of events which is the most frequent in Archegoniate plants at large, and I particularly wish to point out that while such irregular developments are now shown to be frequent in Ferns, they are exceedingly rare in Bryophytes, and are not, I believe, hitherto recorded for Lycopodineæ or Equisetineæ.

While direct vegetative transitions from one generation to the other may appear as a *primâ facie* support of an homologous origin of the two generations, I must protest against their being used, as they have been, as evidence against an antithetic view. It has been said that the facility with which these transitions from one generation to another in Ferns take place "shows that there is no such hard and fast distinction between the generations as the antithetic theory would appear to demand." Why should it demand a hard and fast distinction? For my own part, I had already described apogamy and apospory as occurring in the same individual before I wrote on alternation. The presumption seems to be that a distinct course of evolution must have imposed "hard and fast" limits upon the potentialities of the parts evolved. But we ought to rember how the root, whether in Phanerogams or Ferns, has doubtless had a long course of evolution as a member distinct from the shoot; and yet we see it bearing adventitious buds upon it, as in the Rosaceæ, Poplar or Elm; or even transformed at its apex into a shoot, as in *Platycerium* or *Anthurium*. Such cases as these, though not exact parallels, should suffice to show that hard and fast lines are not to be anticipated as a consequence of a distinct course of evolution.

There is another kindred, though almost converse, proposition which has been advanced by Pringsheim. He made his experiments on Moss fruits, "in the hope that he would succeed in producing protonema from the sub-divided seta of the Mosses, and thus prove the morphological agreement of seta and Moss-stem." The point here appears to be that parts which are capable of producing similar growths are in "morphological agreement." I cannot assent to this proposition. In the case of the roots above quoted, the production of buds upon them, or the conversion of their apices into shoots, does not prove their "morphological agreement" with shoots upon which such developments are common.

By those who use such arguments it is to be borne in mind that the two generations, however distinct in their evolution, are still merely stages in the life-history of one and the same organism. The hereditary qualities of the race as a whole must be transmitted through the successive generations. It may be a question how far, and under what conditions, its various potentialities come into evidence, as, for instance, in the formation of an apogamous sporophyte, or of an aposporous protonema: but that some such potentialities are there is in no way inconsistent with the antithetic theory.

I have above pointed out how morphology has recently passed to an experimental stage, and I am glad to say that by means of the cultures of Dr. Lang and others we are beginning to gain an insight into the circumstances which lead to these phenomena. In certain Ferns direct apogamy occurs; that is, "the immediate production of vegetative buds by prothalli which are usually incapable of being fertilised"; the origin of this is still obscure. But apogamy may also be induced in various other species. Dr. Lang states that "the causes which appeared to induce apogamy in these prothalli were, the prevention of contact with fluid water, which rendered fertilisation impossible, and the exposure to direct sunlight. Possibly the temperature had some effect." It is further to be noted that in every case of induced apogamy "normal embryos were produced when conditions permitted fertilisation." Now the conditions of prevention of fertilisation, exposure to light, and possibly also a high temperature, all lead to a plethoric state, which we may thus recognise as a precursor of induced apogamy, possibly also of apogamy at large.

On the other hand, the circumstances which precede or accompany apospory are commonly those of deficient nutrition. In the case of Ugo Brizi's *Funaria*, it is mentioned that the capsules were atrophied and buried in the soil, where they could not obtain nourishment by their own assimilation. In the induced apospory of Stahl and Pringsheim the growths appear upon parts of the chopped up seta, isolated from their usual sources of supply. Among Ferns, the conditions of nutrition which precede apospory have not been noted in all cases; but the following facts are interesting. *Athyrium filix-fœmina* var. *clarissima* is a pale chlorotic Fern with exiguous leafage, while the more or less complete arrest of the sporangia is a concomitant of apospory. In *Polystichum angulare* var. *pulcherrimum* there is no obvious disturbance of the vegetative organs, but I have specially noted the sporal arrest, which, in the specimens examined by me, appeared to be complete. This is, then, a concomitant of apospory, though it may be uncertain how far there is a causal connection. In the case of apospory in *Pteris aquilina*, reported by Farlow, there is an irregular diminution of leaf-area in the pinnules which show apospory; this is accompanied by various stages of abortion of the sporangia, though some fully-matured spores were found. Here, as also in *Polystichum angulare*, the tips are specially affected. Farlow remarks, "the sporangia became more and more irregular the nearer they were to the tip." In the case of *Scolopendrium vulgare*, the plants which showed apospory at so peculiarly early a stage had been raised by Mr. Lowe from prothalli which had been repeatedly divided, a process calculated to affect the physiological condition. The aposporous plants of *Trichomanes alatum*, *pyxidiferum*, and *Kaulfussii*, were all cultivated under artificial conditions, and are characteristically shade-loving plants, a habit which must affect their nutrition. Perhaps the most interesting case, however, is that described by Atkinson in *Onoclea*. In plants from which, by removal of the foliage leaves, the sporophylls had been induced to change their character and develop as foliage leaves, the sori were arrested. "When the leaf has lost so much of its reproductive function that the sporangia are becoming rare or rudimentary in the sorus, apospory frequently occurs, and the placenta develops among the rudimentary sporangia prothalloid growths." Here is, again, a case of deficient nutrition; the assimilating leaves, after formation, but before they could have carried their functions far, were removed. The plant makes an effort to supply their place at the expense of spore production; arrest of sori and sporangia is the result, accompanied by cases of the direct vegetative transition to the prothallus. From these examples we see that deficient, or, at least, disturbed nutrition is frequently, perhaps always, a concomitant of apospory. Thus there is some countenance for the view that apospory and apogamy follow on converse conditions of nutrition.

We may next inquire how these converse conditions may lead to the changes in question; and especially the state of the nuclei ought to be considered. Owing to practical difficulties of observation the behaviour of the nuclei in apogamy and apospory has not been directly followed. But if the nuclear difference between the two generations be, as it is believed, nuclear changes will be closely connected with these vegetative transitions. What could appear more natural than that apogamy, which presumably involves a doubling of the chromosomes, should follow a condition of plethora, and that apospory, which presumably involves a halving of the chromosomes, should follow deficient nutrition?

One further fact in either case appears to me to be specially noteworthy, that the changes are not confined to a single cell. The directly apogamous bud of *Lastrea filix-mas* may, perhaps, be referable to a single cell, but Dr. Lang shows by numerous examples that the transition from characteristic tissue of the gametophyte to that of the sporophyte may arise at various points, and involve considerable tracts of tissue. Similarly I have shown in the case of apospory that the change may affect not one cell only, but cell-groups at various and distinct points of the same individual. It would seem that there is a widespread disposition of the tissues to undergo the change.

For my own part, I think the usual attitude on the chromosome question has been too absolute and arithmetical. Evidence is accumulating from various sources that the usual numbers are not strictly maintained; it is known that in vegetative cells there are often considerable differences of the number of chromosomes from those in the sexual cells of the same plant, while observers have noted the irregularities in the divisions of the pollen-mother cells in such plants as *Hemerocallis* and *Tradescantia*. If there be any causal connection between the number of chromosomes and the morphological character of the sporophyte and gametophyte, irregularities such as these at least countenance the idea of nuclear instability being possible. It will be a question for special treatment and investigation how far nuclear instability is connected with disturbed nutrition. But into the mechanism of the presumable nuclear change, and the question whether it be sudden or gradual, we cannot enter with any more than a speculative interest, in the absence of direct observations. Whatever the nuclear details may be, I regard it as a matter of very great importance to recognise that special conditions of nutrition commonly accompany, if indeed they do not actually determine, those changes which we term apospory and apogamy. But the story of the past is not simply a matter of conditions of nutrition, as we see them now influencing Archegoniate plants in their present highly specialised state. The real question is a purely historical one, How *did* the present state of things come about?

(To be continued.)

Centennial Grape.—When Messrs. T. Rivers and Sons recently exhibited fruit of this Australian white grape the berries, long oval in shape, were the largest, perhaps, of any white variety seen. Not only were they devoid of quality, but were, on being cut, found to be hollow. Possibly the variety had in that case been too liberally grown and fed. Mr. W. Roupell had a small bunch of the variety at the Drill Hall on the 20th ult,,and the berries, smaller and better coloured though still very fine, were of far superior quality, having firm flesh of a rich musky flavour. It had all the appearance in that case of being a big Cannon Hall Muscat. Mr. Roupell had found it to be like that variety, an indifferent setter. His Diamant Traube, a pretty white grape, which he strongly recommended for invalids, merits all his praise for such purpose.—A. D.

Park Place, Henley-on-Thames.—That a most enjoyable day is spent at the above place on the occasion of the annual reunion of past and present employés is proved by the large number of old hands who availed themselves of Mrs. Noble's kind hospitality on a recent occasion. The invite extends to all who have served in the gardens or on the estate during the last twenty-five years, and many are the happy meetings of men who served together in bygone days, and who otherwise would seldom or never come into contact with each other again. The kindly interest evinced by Mrs. Noble in the welfare of all who have served on her beautiful estate is sincere, and her presence on the scene of the day's pleasure is hailed with the warmest enthusiasm by all. An interesting ramble round the well-kept gardens and grounds with the able and respected chief, Mr. G. Stanton, under whom all have served, occupies the early part of the day, and later a cricket match is played between past and present members of the club, the latter invariably winning the game. It must be very gratifying to Mr. Stanton to have around him so many of his old men now away and occupying good positions in various parts of the country—men, too, who owe much to the teaching of their master, both in practical matters and in the botany lessons, which were given in spare time in the bothy and in roadside and meadow rambles. Gardeners do not, as a rule, have too many holidays, but this is one most keenly enjoyed by all who participate, and one cannot help thinking how many might spend enjoyable days were similar gatherings to take place on the many large estates throughout the kingdom. —W. H. L.

PRESERVING SURFACE ROOTS.

I am indeed grateful to "Lux" for dealing mercifully with me. His assertion, however, that he really grows celery on his vine borders with the three-fold object of securing good celery, mutilating his vine roots, and getting food into the soil for the vines, rather diminishes his lustre as an up-to-date gardener. He also admits that he is not alone in his methods, and even craves the support of others adopting such primitive means of culture. Unhappily for "Lux," but fortunately in the interests of horticulture, few such delinquents survive, not being among the fittest. Therefore, we can calmly content ourselves, viewing with equanimity of mind any attack from the lingering few. As a contrast to the antiquated idea promulgated by "Lux" regarding roots in the first nine inches of surface soil, I would remark on what I saw in a noted garden recently. When walking through the vineries with the accomplished head, he showed me with pride and enthusiasm the mass of fibrous roots permeating every inch of the surface of his borders. This most successful gardener showed unmistakably the value he put upon these fibrils by the care with which he handled them. The health of the vines, the crops they were carrying, and their perfect finish were positive proofs that the plants' requirements were thoroughly understood and administered. It would have required the courage of a "Lux" to suggest the digging of these vine borders, and the crooping of them with celery. If "Lux" is a traveller, and ever finds himself in the self-same garden, let him try what effect an announcement of his views will have on the clear-headed, deep-thinking adept in charge.

"Lux's" startling declaration in italics that "*roots do not create food, but food creates roots*," is only in keeping with his other contentions. I wonder what he would think were I to reverse it, and say that roots create food, but food does not create roots? Strictly speaking, I entirely fail to see what assumption he can base his assertion upon—that food creates roots. Perhaps he will kindly enlighten us. For, remembering a rather heated discussion years ago in a contemporary on this same subject between weighty men for and against the root-creating power of food, and the result arrived at being doubtful, I will still leave it a moot question. The food-creating power of roots is, however, a very different thing, and a fact familiar to lesser lights than "Lux." This fact has been referred to more than once in the pages of the GARDENERS' MAGAZINE during the last few years. In order to make the fact apparent to "Lux" (for his light burns low at times), it might be well for me to remark that water is the natural solvent of plant food in soils. Any substances that do not dissolve in water are termed insoluble. Now, I have seen some big trees growing in rocks—limestone, for instance—with their roots outside the influence of "Lux's" mutilating machine, and yet they grew and flourished like green bay trees. Limestone rock is insoluble, in the general sense of the term ; but the roots of trees are able to create food out of it to support the growth of the plants. It will be remembered that roots are organs of excretion, as well as organs of absorption. As such they, by osmosis, pass out at their ends sap, which generally has acid properties, and this dissolves substances otherwise insoluble, *creating* and assimilating plant food out of them. The simplest means of demonstrating this fact is to cover a piece of perfectly smooth polished marble with a thin layer of sand, sow mustard seeds on it, and keep moist and warm. When the young plants have grown for a short time wash all off, and it will be found that the rootlets have eaten their way into the marble. Seeing, thus, that roots will decompose insoluble solid rocks, and *create* plant food out of them, we can readily perceive, in our mind's eye, how the same process is facilitated in soils. Knowing this, we can dismiss "Lux's" "new truth" and aphorism from our thoughts with the kindly wish that he may be more fortunate in his next selection of such luxuries.

"Lux" asks me to say which fruit trees are the healthiest, those growing in old orchards without culture, left, in fact, to Nature ; or those in cultivated land where the soil is annually dug. Two wrongs do not make a right, and I certainly strongly condemn neglect in the one case, and the ruthless destruction of fibrous roots in the surface soil in the other. Neither modes of culture tend to desirable results. Nevertheless, in answering the question, I am sorry my experience and observations do not enable me to verify the conditions in which "Lux" has been pleased to present the respective points. On the contrary, I have had to dig up in my time hundreds of dead and dying fruit trees which had been slowly, but surely, killed by the pernicious practice of digging the surface soil occupied by their roots, and destroying all these organs of nutrition found therein. And I can point to many now that are fast going the way of all things organic through the same cause. With a deep, fertile loam—a rather rare thing—fruit trees may exist for a considerable length of time even with their roots confined to the under stratum, but their growths and crops are never what they would be were they allowed and encouraged to occupy the surface soil. In the "Wasted Orchards of England" there are too many examples of neglect. But where roots are left undisturbed, and stock kept from the fruittrees, they never assume the pitiable appearance of those mutilated objects grown on what "Lux" terms cultivated land. Growths may be short and small, fruit scanty and below the average size, but the trees, when free from parasites, are generally healthy. In describing the two sets of trees, "Lux" has made the same mistake as he did in connection with roots and food. He has reversed facts to suit his own purpose.

Again, "Lux" refers to a "famous nurseryman who tears bushels ot roots from his pot peach trees annually, and the result is the admiration of all who see his work." This we can quite understand. Trees restricted in growth have to be restricted in the number of their roots, in order to secure a balance between the two. A special object requires special treatment to attain it, but there are generally more ways than one of arriving at the desired result. In dealing with pot peaches, some might favour the intelligent use of manures to that of wasting food and the plants nutritive organs, to accomplish their aims. By repressing, or otherwise confining the extension of branches, the proportion of nitrogen to that of phosphorus and potash usually employed should be reduced. In fruit culture generally, orchards, for example, the trees should be encouraged to grow as quickly as possible with only as much knifing as may be necessary to secure light to all parts and the head uniform. The trees ought to be regularly fed ; the natural fertility of the soil determining the kinds of manures, and quantities of each, to use. If the orchard is a grass one, a double dose will be necessary. In all cases the fertilisers should be applied in autumn or early winter as top-dressings, to allow time for their being well washed into the soil before they are needed by the plants. During the dormant period of the trees manures can be applied better than when the roots are in action, and those which have to undergo a chemical change before they can be of any use to the plants, have time for a rearrangement of particles. Among manures for this purpose may be noted basic slag, bone meal, fish guano for phosphorus ; kainit, sulphate of potash, and ash from the burned refuse heap, for potash ; and sulphate of ammonia for nitrogen. The chemicals may be applied at four ounces to the square yard when the roots are not active, and only half that quantity when they are so. The best manure of all, however, is farmyard liquid. It can be used at its full strength without the least harm ; but frequent applications of this will necessitate an occasional one of quicklime. By feeding with these materials, and feeding with judgment, the health and growth of the trees can be regulated to our liking, and heavy crops of fine fruit obtained annually. Not only this, but the roots of the plants will be inveigled into the surface—richest, healthiest—layer of soil, and get the benefit of the air. "Lux" lays such stress on "without mutilating and lacerating them." The plants' roots would find food ready to hand, and would neither have to multiply to get it, or hunt to find it—important items in successful fruit culture. If "Lux" will read, study, and digest these well-known facts, and lay them to heart, perhaps "Peter" will have less grounds for contention and more reverence for his master.

J. Riddell.

VINE CULTURE IN THE OPEN.

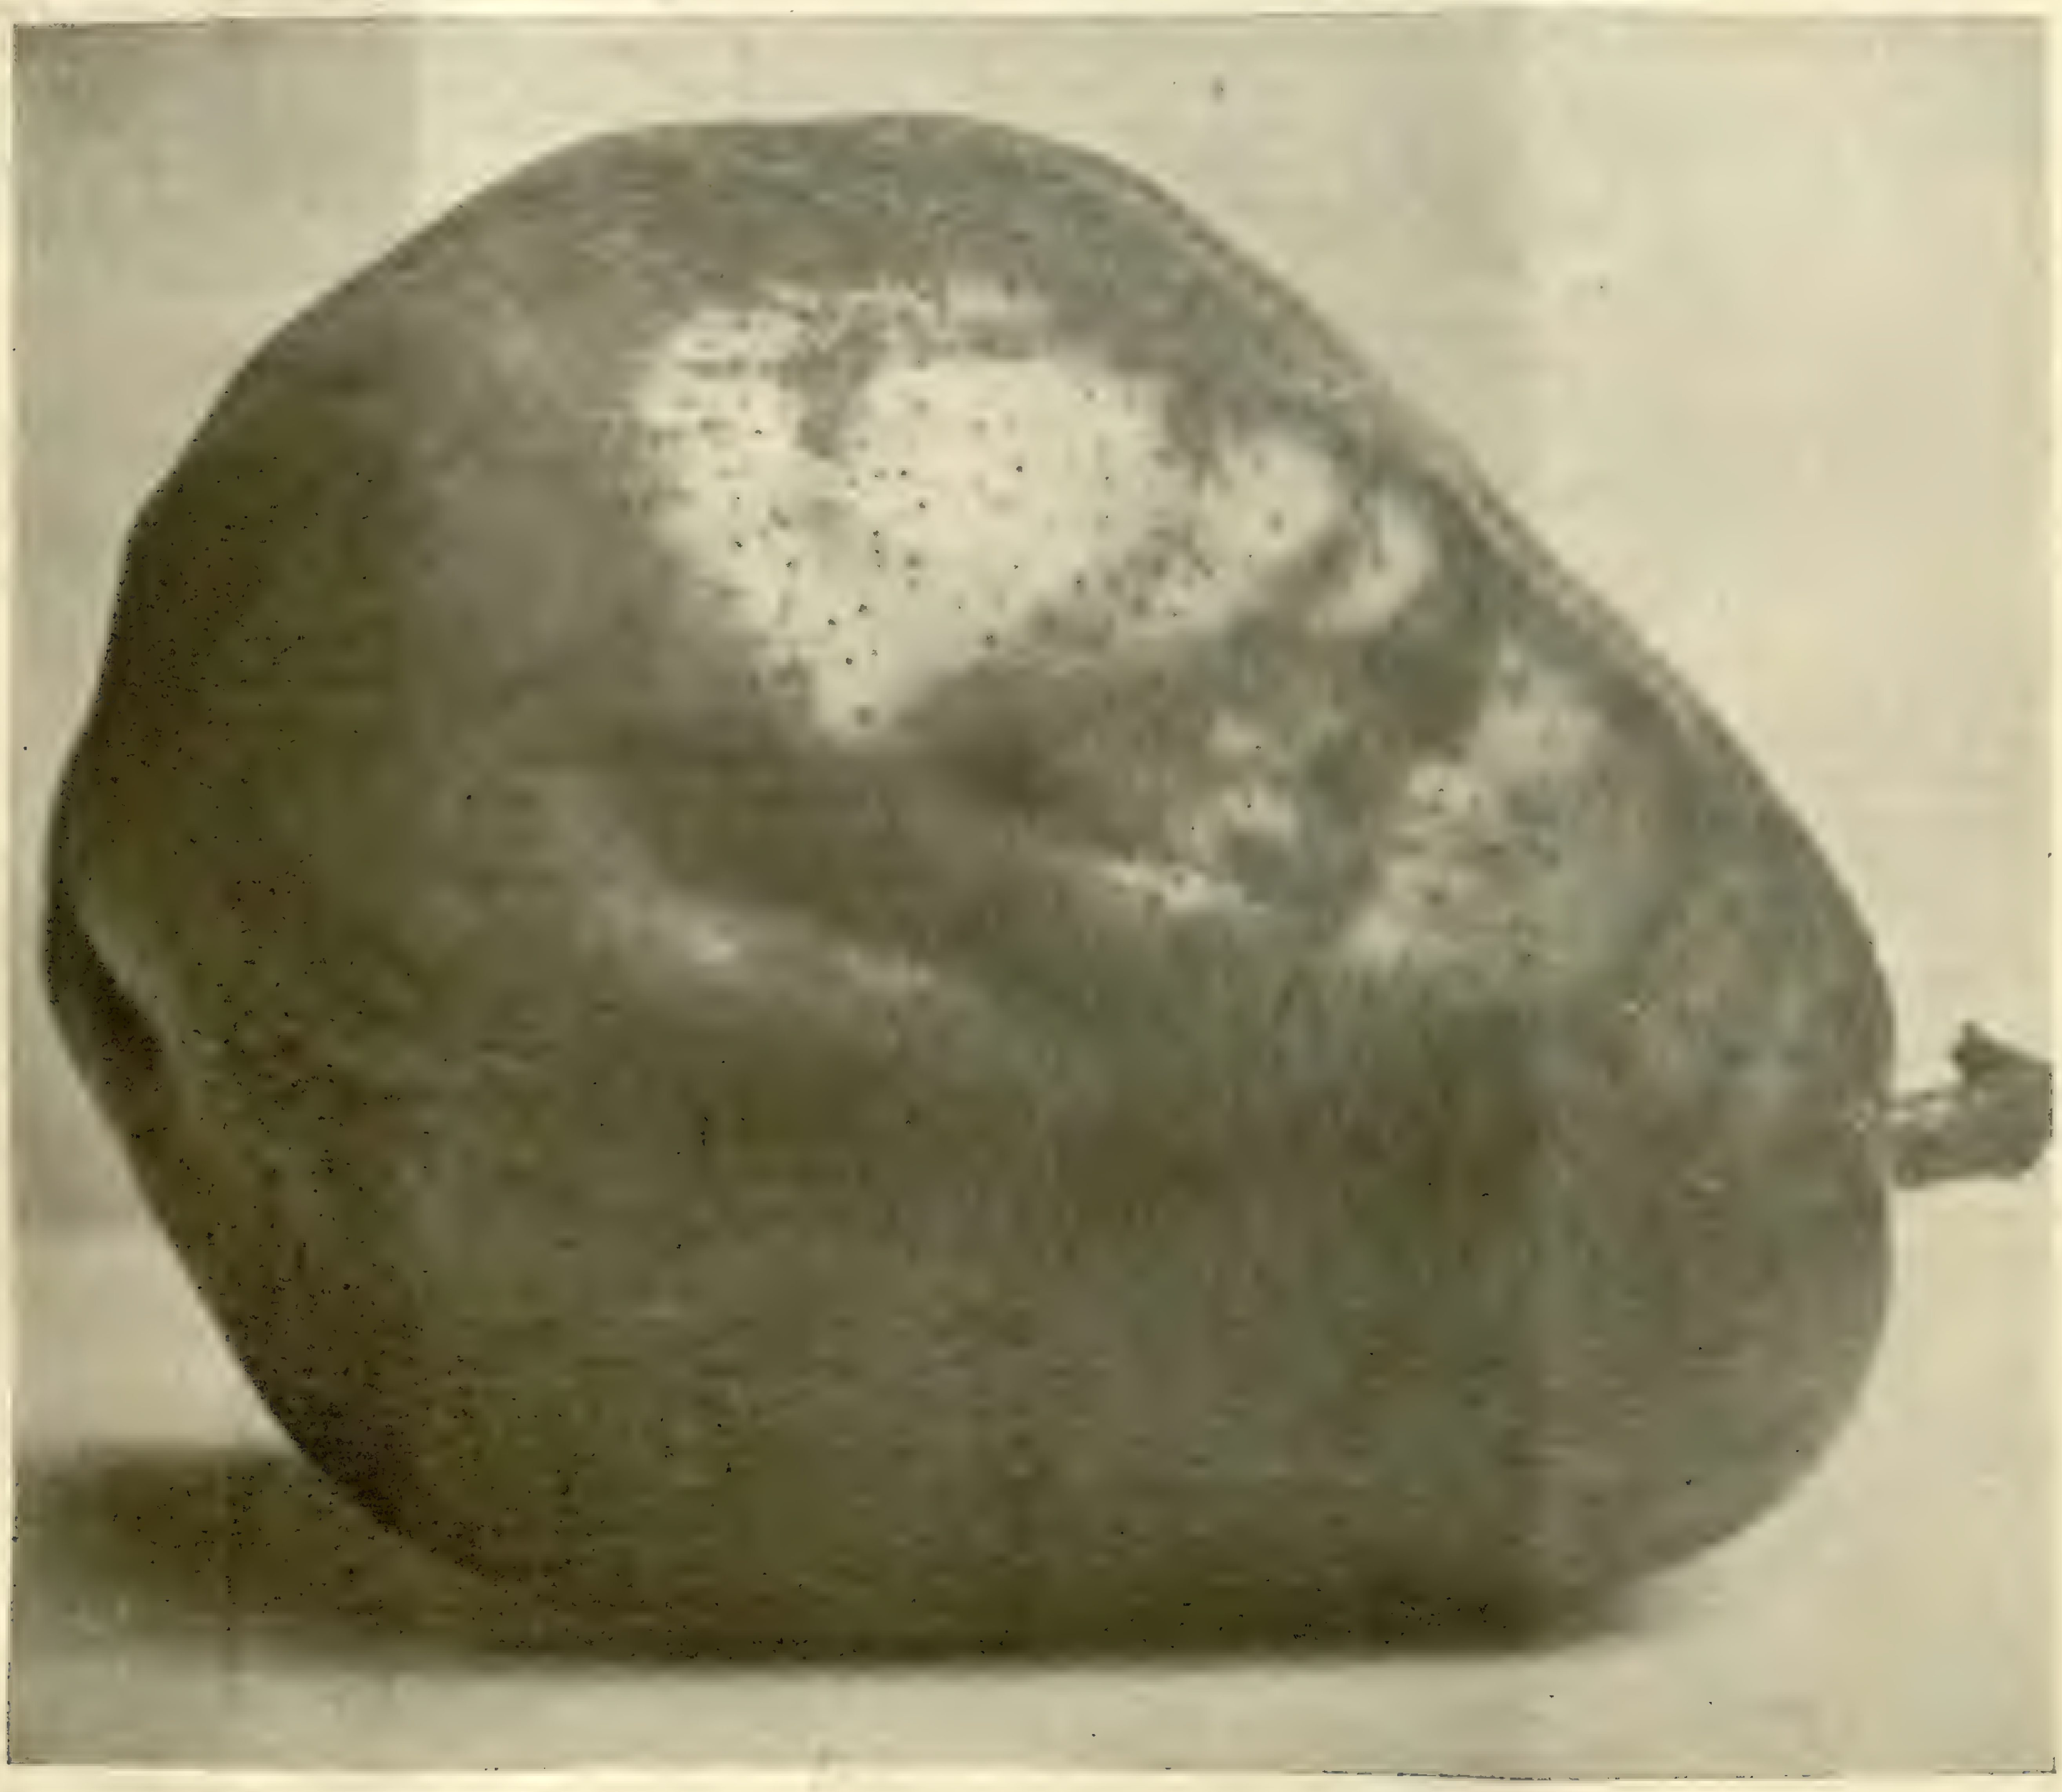
In his book on "Vines and Vine Culture," Mr. A. F. Barron strongly recommends the Royal Muscadine for open-air culture on walls : he also mentions Black Hamburgh and Black Prince as ripening their fruits sometimes in fine weather. White Frontignan and the Dutch Sweetwater are also mentioned as ripening their fruits very fairly on walls in the Chiswick Gardens, but the latter frequently sets badly. When Mr. Robert Fenn was at the Rectory, Woodstock, many years ago, he grew grapes in the open with great success; but they were planted against the gable end of the house, and had the advantage of a chimney flue, at the bottom of which a fire was always burning by day. Some years ago Black Hamburgh grapes were annually grown, ripened, and coloured upon open walls at Branham Park, Tadcaster, but the walls were warmed by means of flues. In this case one hundred and twenty yards of the south side of the gardens were flued, and from this wall excellent peaches, apricots, and Black Hamburgh grapes were obtained, the peaches and apricots ripening fully three weeks earlier than upon walls not flued, thereby extending the season by that time. In fine summers it was said the Black Hamburgh grapes ripened as completely and coloured as finely as in a vinery. It must be admitted that even in the most favourable districts in the south of England grape-growing is a precarious business ; and this is probably the main reason why it is so seldom attempted. Yet there are many who, while they cannot afford to erect a glass structure, might undergo the expense of flued walls. It does appear as if the principle, if it is not extensively applied, is yet capable of more general application.

What is the time required to bring grapes to perfection in the open air? In the grape-growing districts of France the vines begin to grow about the middle of March, and the fruit is ripe about the end of September or beginning of October ; and as the mean temperature in March and April in France is somewhere about eight degrees above what it is in this country ; and September and October would be probably about ten degrees higher than with us, it will be seen that our summers are not long enough for the cultivation of the grape in the open. Hot as the summers are sometimes while they last, some artificial means require to be adopted to obtain the best results. It is true that in the Marquis of Bute's vineyards in South Wales grapes will generally ripen pretty well in the open air. It must be remembered, however, they are special sorts, grown for wine-making, and not for eating. Seeing then it has been taught by experience that a flued wall is quite sufficient to counteract the shortness of our seasons, even so far north as Yorkshire, and as flued walls are probably as easily and as cheaply constructed as solid ones, their construction is to be commended. Of course, fire-heat would be required at night and on cold days during the months of March, April, and May to start the vines into early growth, and also in September and October to ripen the fruit and wood ; and as to the cost of heating, it would be a mere trifle, as anything in the way of fuel could be burned—such things as prunings and rubbish which will burn might be disposed of in this way.

A projecting coping would be found necessary to prevent the too rapid radiation of heat in the earlier stages of growth, and a warm, dry border is indispensable, which might be covered during the winter months with some materials to protect the roots from heavy and cold wintry rains, and this might be secured by the use of wooden shutters, straw, &c. This covering would be necessary before the cold drenching autumn rains set in, and it is probable that a coat of fermenting material applied about the beginning of March, would be found to facilitate the rising of sap. The shoots would require to be kept thin and closely nailed to the walls, and all lateral shoots closely stopped. It would perhap proves an advantage if the walls were blackened. R. D.

PEAR DR. JULES GUYOT.

THIS handsome and otherwise excellent early pear, of which we give herewith a characteristic illustration, is by no means new, for it was introduced to cultivation in 1873 by its raisers, the MM. Baltet Frères, of Troyes It is, however, one that has been overlooked by the general body of fruit growers, or at any rate has not been accorded a fair trial in many private gardens or market plantations. Probably this fact is due to the expression of opinion—amounting to a condemnation—given of it in the last edition of "The Fruit Manual." From observations made during the last few years in some establishments where this pear is much appreciated, we are fully persuaded that Dr. Jules Guyot is well worth cultivating for the supply of the table and market early in the autumn, and Mr. George Bunyard regards it as one of the most valuable pears of its season. Notwithstanding this it is not a variety of which the general body of gardeners are advised to plant any considerable number of trees, and in the largest of gardens two or three at the most will suffice. The market gardener, on the other hand, who has a ready market for a handsome and good pear, ripening about the middle of September, will do well to plant it somewhat largely, the number of trees being determined by his means for disposing of the fruit, for though in colour and shape resembling Williams's Bon Chrétien, it is larger and of finer appearance. When ripe the skin is yellow, with a pale crimson blush on the sunny side; the eye is open and set on the surface; the stalk is short and fleshy; the flesh tender and very juicy, and of good flavour, this being intermediate between Williams's Bon Chrétien and Louise Bonne of Jersey. The fruit does not last in good condition for many days, hence the need of the advice we have given with regard to the number of trees. This variety is admirably adapted for light loamy soils, on which it grows vigorously, and produces heavy crops of finely flavoured fruit. Trees should be planted in various positions, so as to prolong the season, just as in the case of Williams's Bon Chrétien, a well-known variety that no one condemns as worthless, simply because it ripens quickly and soon passes its best condition. Dr. Jules Guyot does well on the quince stock, making a compact growth, and usually crops more heavily than Williams's Bon Chrétien, owing chiefly to it withstanding the spring frosts. Our illustration is a reproduction of a photograph specially taken for us by Messrs. Negretti and Zambra of one of the fruits exhibited by Messrs. G. Bunyard and Co. at the recent exhibition of British grown fruit held under the auspices of the Royal Horticultural Society at the Crystal Palace.



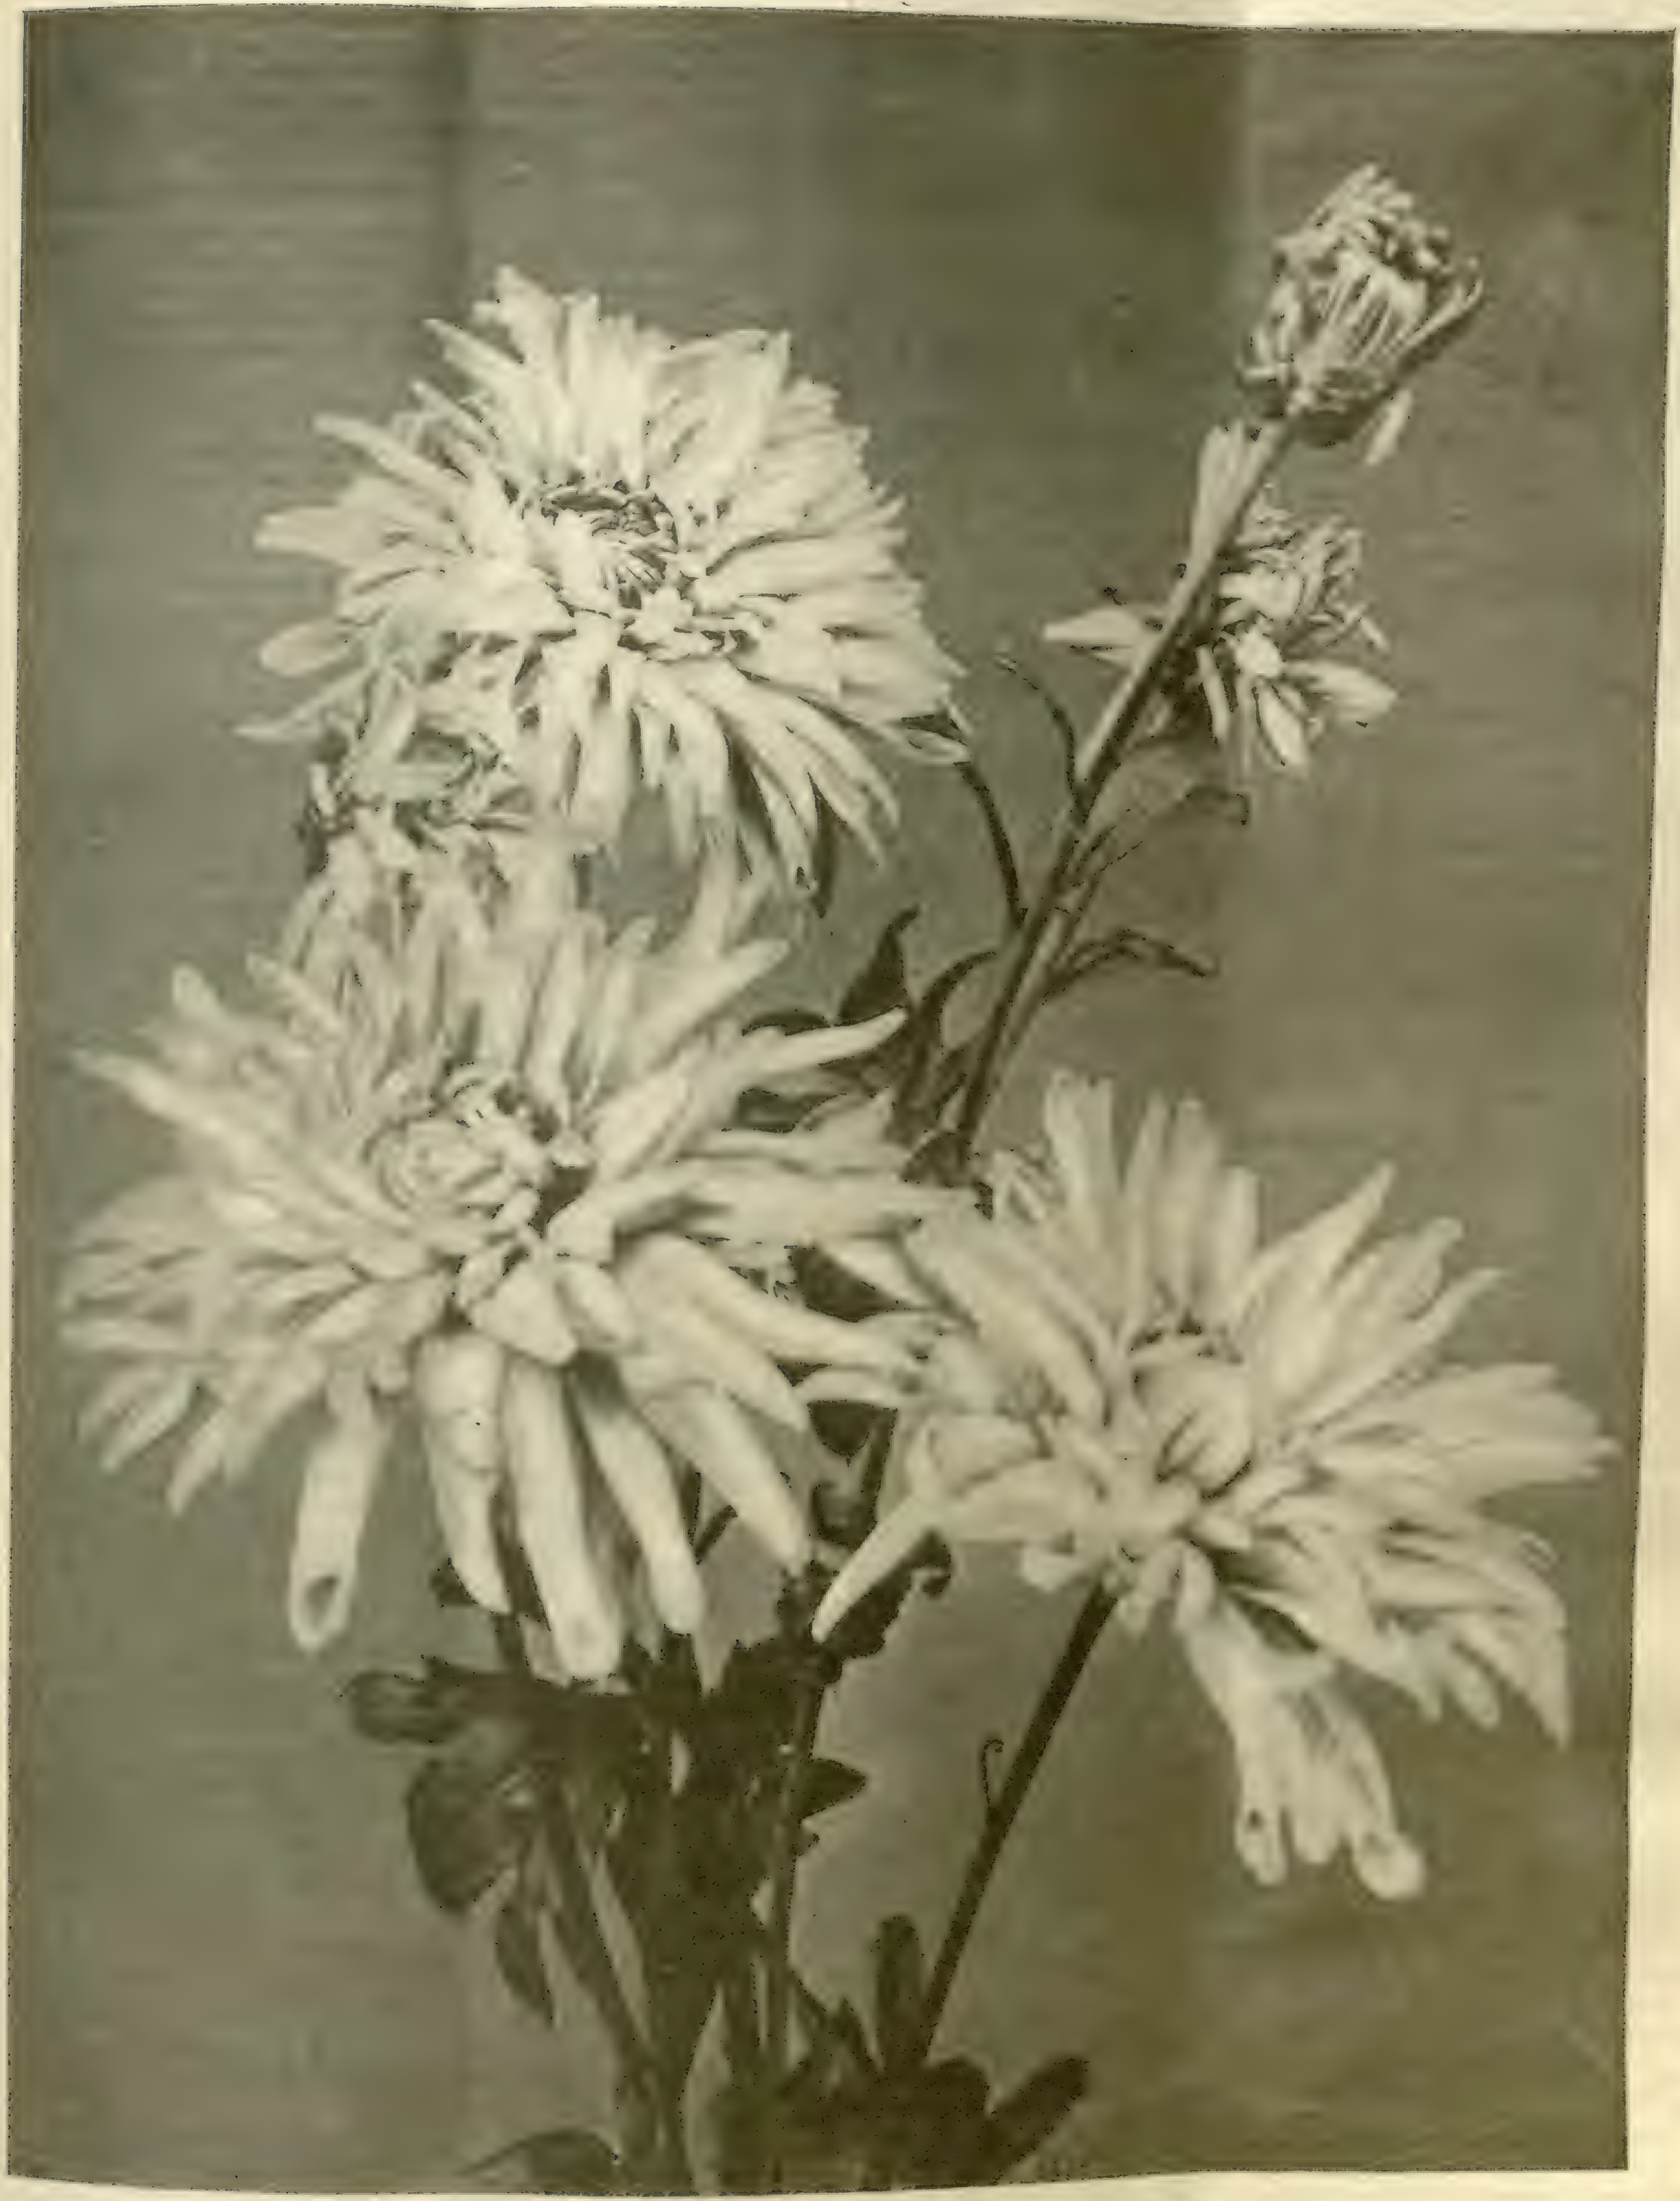
PEAR DR. JULES GUYOT (Natural size).

Begonia Disease.—I have noticed for two seasons a mite on the leaves of the fibrous rooted begonias. The mite is much like the celery-fly (Sephritis ompordinis). It commences from apex of the leaf, and eats its way through, mostly on the indoor plants. If we are going to be troubled in this way, a remedy is greatly needed, as the begonia has become a favourite plant with many. —J. H. S., *Taunton*.

A GOOD EARLY-FLOWERING CHRYSANTHEMUM.

ALTHOUGH this season has not, so far, been one of the best for early-flowering chrysanthemums as a class, yet about four varieties out of our small collection of a dozen and a half have proved eminently satisfactory, both for effect in the garden and their usefulness in a cut state. These four are: Flora, golden yellow; Piercy's Seedling, bronzy orange; Harvest Home, crimson-scarlet and gold; and Madame Marie Massé, rose or lilac-mauve, with a silvery sheen. Of these four the last-mentioned has been by far the best, though in a large garden it would scarcely be so effective as the two first-mentioned. It flowers with the utmost freedom, and as the flowers are so large, and rather heavy, it is good practice to place a neat stake for the support of the central or main stem. Under quite ordinary culture, in fairly good garden soil, and with an occasional watering during the continued drought, we have had many flowers five inches and more across, and without recourse to disbudding. Three plants were put out in April last from sixty-sized pots, and these have given us a most pleasing display ever since the first week in September, while some scores of flowers have been cut for indoor decoration, where they last in good condition for more than a week. One plant not so much exposed to the sun as the others has only just commenced to open its first flowers, so that this, together with the flowers open and yet to expand on the earlier pair, will give us flowers well into next month, provided the weather does not become too wintry. The accompanying illustration shows three flowers and some buds, all on one spray, but to admit these to the picture the camera had to reduce the size of the blooms. Madame Marie Massé is a first-rate autumn-flowering Japanese chrysanthemum, and for it we are indebted to Mons. Délaux, who distributed it in 1894. In 1895 some flowers were placed before the Floral Committee of the National Chrysanthemum Society, when a first-class certificate was awarded. To show the usefulness of the variety we may add that the date of the award was October 8.

Sedum spectabile.—Why is not this fine stone crop more extensively grown? it might well be asked, for there is no plant in my opinion more attactive at this season; the colour is not brilliant, but a soft and pleasing shade of pink; my plants of it are between three and four feet through, and it is much beloved of insects. In former years I have seen many species of butterfly rejoicing in it—red admirals, painted ladies, tortoiseshells, and brimstones—but this year I have hardly seen one, corroborating what I have said some times since with reference to the great scarcity of butterflies this year. I do not think that we have many butterfly hunters about us, so this can hardly be traced to that, but most probably to our cold spring. Bumble and hive bees also rejoice in it, and the former become so intoxicated or overfilled that they do not seem to be able to get away from it, and so die in numbers.—H. H. D.



EARLY-FLOWERING CHRYSANTHEMUM, MADAME MARIE MASSÉ.

THE PEAR CROP.

Berks.—Pears all round are a heavier crop here this season than apples, and though, owing to the drought, not extra large, the fruit generally is fine—some above the usual size, of good colour, and free from spot. Those named are carrying heavy crops: Bergamotte d'Esperen, Beurre Bosc, Beurre d'Amanlis, Beurre Diel, Beurre Giffard (good old early sort), Beurre Hardy (very good), Beurre Mortillet, Beurre Superfin, Williams' Bon Chrétien (heavy crops on walls), Clapp's Favourite (very fine), Chaumontel, Doyenne d'Ete (early), Doyenne Boussoch (fine, but does not last long), Doyenne du Comice (one of the best), Duchesse d'Angoulême (very fine), Durondeau (high colour), Fondante d'Automne, General Todleben (handsome fruit), Glou Morceau (fine flavour and good cropper), Jargonelle, Louise Bonne of Jersey, Madame Treyve (large), Magnate (new variety), Marie Louise (heavy crops), Knight's Monarch (an excellent sort), Ne Plus Meuris, Olivier de Serres, Pitmaston Duchess, Seckle, Souvenir du Congrès (early), Thompson's (one of the best for flavour), Vicar of Winkfield (large and heavy crops, but only grown for stewing), and Winter Nelis. A wall of single cordons (west aspect), and including many of the above and other sorts, are fruiting very freely; these have been partly thinned out early in the season, and are now clothed with fine, clean fruit.—OWEN THOMAS, *Frogmore.*

Cork.—Pears are small and deformed in most gardens. Glou Morceau, Marie Louise, Beurre Superfin, Autumn Bergamot, Beurre Brown, Duchesse d'Angoulême, Beurre Diel, and Williams' Bon Chrétien almost useless in consequence of the long drought, but full crop. Aston Town and the old Bishop's Thumb have had the best crops. Other varieties have borne a few, but in all cases fruit much below an average in quality.—W. OSBORNE, *Fota.*

Devon.—Pears are almost a total failure. Beurre d'Amanlis, Louise Bonne of Jersey, Glou Morceau, Durondeau, and Josephine de Malines are the only varieties bearing anything, and those barely half a crop, and, I should add, all on cordon-trained trees.—J. ELLICOTT, *Exeter.*

Essex.—Although pears were a grand crop last year, there is an almost entire absence of these useful fruits this season.—S. PRAGNELL, *Chelmsford.*

Forfarshire.—Pears this year, with us, are a total failure as they are only grown on the walls here. We have not a very large selection. The varieties generally most satisfactory are Williams' Bon Chretien, Louise Bonne of Jersey, Beurre Bosc, and Autumn Bergamot.—T. WILSON, *Glamis Castle Gardens.*

Glamorganshire.—Pears are a heavy crop, the trees are clean and free from blister, and the fruits, comparatively, are much larger than the apples. The following varieties are carrying good crops this year: Jargonelle, Williams', Bon Chretien, Beurre d'Amanlis, Beurre Hardy, Beurre Bosc, Beurre Diel, but the fruits of the latter are badly scabbed, and a great many are dropping. Beurre Clairgeau, Beurre Rance, Bergamotte d'Esperen, Durondeau, Doyenne du Comice, Glout Morceau (extra heavy crop, trees robust and in vigorous health), Josephine de Malines, LouiseBonne of Jersey, Marie Louise, Ne Plus Meuris, Pitmaston Duchess—good crop on walls, but slight crop on pyramidal trees—Thompson's, Vicar of Winkfield, and Winter Nelis, Gansel's Bergamot, Beurre Bachelier, are very fine on a wall with a wet exposure, and General Todtleben is good on a south exposure.—A. PETTIGREW, *Cardiff Castle Gardens.*

Gloucestershire.—Pears are a very thin crop, except Jargonelle, Williams' Bon Chretien, and Beurre Diel. Perry pears are more plentiful, but a lot of the fruit is dropping off before it is ripe.—J. APLIN, *Hasfield Court Gardens.*

Hampshire.—Pears are below the average both in quantity and quality, which must, as in the case of apples, be attributed to the bad weather in their early stage of growth. The young fruit received a check when commencing to swell freely, from which they never appear to have properly recovered. Fan-trained trees on warm walls are carrying the best crops, and the fruit is larger and better shaped than in pyramid and bush trees, but even when the roots have been kept supplied with moisture, the fruit is much smaller than usual. Our best varieties mentioned somewhat in their order of ripening, are Jargonelle, Souvenir du Congrès, Williams' Bon Chretien, Madame Treyve. Beurre d'Amanlis, Seckle, Marie Louise, Beurre Superfin, Beurre Hardy, Doyenne du Comice, Durondeau, Beurre Bosc, Marie Louise, Pitmaston Duchess, Marie Louise d'Uccle, Winter Nelis, and Glout Morceau. All these are excellent here. Triomphe de Vienne will also turn out a good variety, I think, but we have not yet given it a fair trial.—G. TRINDER, *Dogmersfield Gardens.*

—— Pears on walls are a fairly good crop. The best early pears are Jargonelle, Williams' Bon Chretien, and Clapp's Favourite. Later sorts that are good are Louise Bonne of Jersey, Thompson's, Marie Louise, Pitmaston Duchess, Beurre Superfin, Beurre Bosc, Doyenne du Comice, Winter Nelis, Easter Beurre, Zepherin Gregoire, Beurre Diel, Hacon's Incomparable, Knight's Monarch, Beurre Rance, Glout Morceau, Bergamotte d'Esperen, and Passe Crasanne. Of stewing pears the most constant bearers are Catillac, General Todtleben, Uvedale's St. Germain, and Vicar of Winkfield. The finest crops on standard trees in the open are Beurre de Capiaumont, Hessle, Marie Louise, Louise Bonne of Jersey, Princess, and Durondeau. Other standard pears are thin in fruit this season.—J. W. MCHATTIE, *Strathfieldsaye Gardens.*

Kent.—Pears, under average. With me most of the best varieties are poor. The only sorts that have done well are Pitmaston Duchess, Doyenne Boussouch, Durondeau, and Margaret Marillatt. Louise Bonne, Doyenne du Comice, and Beurre Hardy's seemed to have suffered from scorching. A large early pear is Beurre Mortillet, fairly good quality; one of the largest; will not keep many days after gathered, though bright and attractive. Nouvelle Fulvie is not so well known as it should be; excellent flavour; rather poor appearance; needs to hang on the tree as long as possible, otherwise they shrivel. I usually tie ours on.—GEORGE WOODWARD, *Barham Court.*

King's County.—Pears, except on the walls are a light crop. Those about an average crop are Williams' Bon Chretien, Jargonelle, Doyenne d'Ete, Duchess d'Angoulême, Beurre de Capiaumont, Beurre Diel, Brown Beurre, Easter Beurre, Marie Louise, Louise Bonne of Jersey, Josephine de Malines, Souvenir du Congrès, White Doyenne, Durondeau, Napoleon, Marie L. d'Uccle, Fertility, and Zepherin Gregoire.—R. MCKENNA, *Charleville Gardens.*

Kirkcudbright.—Pears are very poor, Autumn Bergamot, Beurre Diel, Brown Beurre, Easter Beurre, Marie Louise, Williams' Bon Chretien being the best.—J. HANNAH, *Cairnsmore Gardens.*

Lanarkshire.—Pears are an average crop.—W. SUTHERLAND, *Bothwell Park Gardens.*

Leicestershire.—None of our pears are carrying heavy crops this season. Blossom was plentiful, and was well protected with netting. The fruit, too, has suffered from the hot, dry weather, and will not be so large as usual. The varieties that have done the best comprise Jargonelle, Beurre Superfin, Beurre Diel, Beurre Hardy, Beurre du Buisson, Easter Beurre, Emile d'Heyst, Doyenne du Comice, Maréchal de la Cour, Thomson's (the best-flavoured of all, and bears well on a pyramid tree), Josephine de Malines, Dunmore, Louise Bonne of Jersey, and Beurre Rance; the latter seldom comes to perfection here.—W. H. DIVERS, *Belvoir Castle Gardens.*

Middlesex.—Pears are thin on standards, but on walls are a fair crop.—A. R. ALLAN, *Hillingdon Court Gardens.*

Monmouthshire.—Pears are under average, but the quality of the fruit is good. The following upon walls have good crops:—Jargonelle, Flemish Beauty, Beurre d'Amanlis, Beurre Superfin, Souvenir du Congrès, Louise Bonne of Jersey, Durondeau, and Beurre Diel; while upon Pyramids, Baronne de Mello, Doyenne du Comice, Durondeau, Beurre d'Amanlis, Beurre Fouqueray, Beurre Bosc, Louise Bonne of Jersey, and Williams' Bon Chretien are good bearers. Souvenir du Congrès is a grand pear, not so often met with as it deserves to be. It is in season with Williams' Bon Chretien, which is one of its parents. Durondeau is another handsome and highly-flavoured variety that should be included in every collection. Our most heavy cropper this season is the best of all pears, Doyenne du Comice; but Marie Louise, Beurre Hardy, Pitmaston Duchess, and Conseiller de la Cour, which usually carry good crops, are poor this year.—T. COOMBER, *The Hendre Gardens*

Montgomeryshire.—Pears are an average crop of fair size fruit. Williams' Bon Chretien, Beurre Boussoch, Louise Bonne of Jersey, Brockworth Park, Pitmaston Duchess, Beurre Superfin, Beurre Diel, Marie Louise, Doyenne du Comice, Glout Morceau, Beurre Steckmans, Marie Louise d'Uccle, Autumn Nelis, Duchess d'Angoulême, Fertility, and Beurre d'Anjou are the best.—J. LAMBERT, *Powis Castle Gardens.*

Norfolk.—Pears on walls are good, and have had to be thinned, with the exception of a very few trees. An unusual amount of labour has been bestowed on the trees, to cleanse them from pear leach—lime and sharp sand I find the best remedy. They have had repeated syringing with quassia, and soluble paraffin to cleanse the leaves from aphis and honey dew. Such a year for filth on trees I never remember; heavy waterings at intervals had to be given to induce the fruit to swell away. The fruits are now promising to be of good size, and to repay for all the extra labour bestowed.—W. ALLAN, *Gunton Park Gardens.*

Northampton.—The following are exceptionally well cropped, but are rather of poor flavour, considering the exceptional tropical temperature, I might say, we have had the past few weeks: Doyenne d'Ete, Jargonelle, Beurre Giffard, Clapp's Favourite, Beurre d'Amanlis, Beurre Superfin, and Marie Louise. The following are the next best croppers, all being on walls: Van Mons. Leon de Clerc, Glout Morceau, Louise Bonne of Jersey, and Doyenne du Comice. Espaliers and pyramids of all varieties are far below the average, particularly Winter Nelis, Bergamotte d'Esperen, Zepherin Gregoire, Knight's Monarch, Pitmaston Duchess, Ne Plus Meuris, Dr. Lindley, Maréchal de la Cour, and Beurre Rance.—J. HAYES, *Castle Ashby Gardens.*

Northumberland.—Pears are all grown on walls. The best are Jargonelle, Louise Bonne of Jersey. We have Triomphe de Vienne, highly commended as a September pear; we have it on trial. Styrian is good, Beurre Superfin, Brockworth Park, Backhouse Beurre, Marie Louise (these I would especially emphasise). Doyenne du Comice is the best pear we have in November; it does well as a cordon and espalier on south wall, and in pots, sheltered a few weeks up to the middle of June in a house, then plunged in ashes in the open until it begins to bloom; the next year very fine fruit can be had of the highest quality. The same may be said of Josephine de Malines, the best late as to the pot system. Emile d'Heyst fruits as a young tree; Beurre d'Amanlis is free to crop in the country; Hacon's Incomparable, Conference, Comte de Chambord, Beurre Van Geert are all of excellent flavour, but the trees as yet are small. Winter Nelis does in best positions north of this. Beurre Clairgeau we grow for early cooking, great cropper; also Flemish Bon Chretien.—G. HARRIS, *Alnwick Castle Gardens.*

Queen's County.—Pears are a very thin crop upon orchard trees—there are scarcely any. Trained trees against an east wall and on the quince stock are carrying a few good fruits, the best being Jargonelle, Bellissime d'Hiver, Catillac, and Easter Beurre. Many other varieties, although a sheet of bloom, have not produced a single fruit.—W. BEGBIE, *Emo Park Gardens.*

Radnorshire.—Williams' Bon Chretien, Marie Louise, Fondante d'Automne, Duchess d'Angoulême are well cropped, and the fruit is good in quality. Pitmaston Duchess on a young tree has a good crop. Louise Bonne of Jersey, Brown Beurre, Beurre Superfin, Beurre Die are very poor. Uvedale's St. Germain, heavy crop.—W. PALLISER, *Norton Manor Gardens.*

Shropshire.—Pears are over the average and of splendid quality. Doyenne du Comice, Beurre d'Amanlis, Beurre Diel, Beurre Giffard, Beurre Bachelier, Beurre Superfin, Josephine de Malines, Fondante d'Automne, Louis Bonne of Jersey, Clapp's Favourite, Pitmaston Duchess, and a lot of others are all heavy laden, whilst the fruits are clean and of excellent quality.—J. LOUDEN, *The Quinta Gardens, Chirk.*

Somerset.—Pears are a very slight crop throughout, but the best are Gros Calebasse (a medium crop of fine fruit and clean), Pitmaston Duchess (medium, fine fruit, and clean), Glou Morceau (nice clean fruit of medium size), and Autumn Crassane (a heavy crop of small fruits on pyramids).—W. H. MILES, *Ilminster.*

Staffordshire.—A fair crop on several varieties, others with a small crop, and a few sorts without any fruit. All trees well furnished with blossom, but hardly a variety which wholly escaped the destructiveness of the frost. The following are the most satisfactory in this district, viz.: Bergamotte d'Esperen, Beurre d'Amanlis, Beurre Clairgeau, Beurre Diel, Beurre Rance, Beurre Superfin, Comte de Lamy, Doyenne du Comice, Duchesse d'Angoulême, Emile d'Heyst, Flemish Beauty, Josephine de Malines, Louise Bonne of Jersey, Marie Louise, Olivier de Serres, Pitmaston Duchess, Princess, Souvenir du Congrès, Thompson's, and Williams' Bon Chretien. Pears, owing to the late cold spring and the long spell of dry weather since, are not so large as usual.—G. WOODGATE, *Rolleston Hall Gardens.*

Surrey.—Here the following varieties are on cordons and horizontally trained: Bergamotte d'Esperen, Zepherin Gregoire, Josephine de Malines, Beurre Bachelier, Ne Plus Meuris, Beurre Rance, Conference, Marie Louise d'Uccle, Louise Bonne of Jersey, Beurre d'Aremberg, Triomphe de Vienne, Glou Morceau, Pitmaston Duchess, Jean de Witte, Baronne de Mello, and Beurre Hardy. Pears here make very clean growth, the soil being very suitable for them, and we have an average crop every year, but not on the same varieties.—W. HIGGS, *Fetcham Park Gardens.*

Sussex.—The fruits set wonderfully well, but owing to the severe frost experienced about the middle of May most of them were so frozen that they fell off, only a few varieties in the open having anything like a crop, and these do not appear to be worth anything. Those on walls are a little better, the best being Beurre Diel, Williams' Bon Chretien, Jargonelle, Marie Louise, Beurre Hardy, Fondante d'Automne, Jean de Witte, Passe Colmar, Huyshe's Prince Consort, Huyshe's Prince of Wales, Glout Morceau, and a few others.—H. C. PRINSEP, *Buxted Park Gardens.*

Sutherland.—The pear crop is very poor—almost a failure, caused, no doubt, by the inclement weather at the time of setting. Jargonelle carried a few medium-sized fruit. Beurre d'Amanlis, which is usually one of our best pears, only bore very sparsely. Galston Muir Fowl-egg under average and small. Others were almost nil.—D. MELVILLE, *Dunrobin Castle.*

Tipperary.—Pears on walls are bearing a splendid crop; Beurre d'Amanlis and Colmar d'Ete are particularly good.—D. R. PHILLIPS, *Abbey Gardens.*

Warwickshire.—Pears are a very thin crop, indeed, and these are quite second-rate in quality. The ravages of the Pear-tree slug (*Tenthredo adumbrata*) played sad havoc with our trees, in spite of frequent dustings of lime on the foliage, which is the only remedy I know of for this noxious pest; a tree of Beurre Diel and one of Duchesse d'Angoulême are carrying very good crops. The remainder of our trees on walls, thirty in number, are practically fruitless.—H. T. MARTIN, *Stoneleigh Abbey Gardens.*

Wexford.—Pears are under the average.—J. McLENNAN, *Castleborough Gardens.*

Wigtownshire.—The following are growing against walls, with various aspects, and are all bearing very satisfactory crops: Jargonelle, Williams' Bon Chretien, Louise Bonne of Jersey, Marie Louise, Princess (Rivers'), Beurre Diel, Beurre Superfin, Pitmaston Duchess, Beurre d'Amanlis, Gratioli of Jersey, Beurre de Capiaumont, and Easter Beurre. As pyramids and bush trees Williams' Bon Chretien, Hessle, Swan's Egg, Louise Bonne of Jersey, Catillac and Autumn Bergamot are very well cropped.—J. DAY, *Galloway House Gardens.*

Worcestershire.—Pears are not such a satisfactory crop as the apples, the best being on the wall trees. All trees bloomed freely enough, but the cold inclement weather was too much for the embryo fruits. That good old variety, Marie Louise, is carrying good crops, so with gathering at intervals the supply will be enabled to be carried on for some time. I do not think the hot weather has hastened the ripening of earlier varieties in the least. The late start in the spring, followed with this hot September month, having timed the ripening about normal. I may say that the fruit is clean and of good quality; Williams' Bon Chretien, Glout Morceau, Durondeau, Beurre Rance, Easter Beurre, Passe Colmar, Beurre Hardy are the most productive.—A. YOUNG, *Witley Court Gardens.*

Yorkshire.—Pears under the average, and smaller than usual. Those carrying the best crops are as follows: Williams' Bon Chretien, Clapp's Favourite, Louise Bonne of Jersey, Doyenne du Comice, Durondeau (or d'Tongers), Pitmaston Duchess, Beurre Rance, Beurre Superfin, and Thompson's.—J. ALLSOP, *Dalton Hall Gardens.*

—— Pears are a very partial crop, the only varieties that have or had anything like a good crop are Doyenne d'Ete, Citron des Carmes, Summer Franc Seal, Beurre d'Amanlis, Louise Bonne of Jersey, Urbaniste, Doyenne du Comice, Beurre Diel, and Bergamot d'Esperen. Marie Louise, which usually does so well with us, is this year almost fruitless. We have a space at the top of a south wall, say, twenty yards long, by an average of three feet in depth, from which we have frequently picked twenty stone of fine fruit. The trees were planted many years ago on the north side of the wall. Some twenty-five years since we trained shoots over to the south side, and they have, as I say, done splendidly, as a rule, ever since they got well over. I am very fond of espaliers for training pears upon when grown away from walls. I would not plant bush or pyramid trees in the north, the fruits are so liable to be injured by the autumn gales before they are fit to pick. We have some espaliers here erected quite fifty years since, I should say, and they are as good now as when first put up. With the exception of an eight-foot wall planted with cordon trees a year or two ago, all our pear trees are growing upon the free stock; cordons are on the quince.—H. J. CLAYTON, *Grimston Gardens.*

Awards of the Fruit Committee.—Your reporter seems to have been incorrectly informed as to the awards of medals made to the various exhibits at the Drill Hall on the 20th ult. Not only Messrs. W. Paul and Sons, but also Messrs. J. Laing and Sons and Messrs. J. Peed and Sons received silver-gilt Knightian medals. The silver-gilt is a superior award to the silver Knightian. Mr. Kelf's award was a silver Knightian, and not a silver-gilt Knightian. The collection of apples shown from Chiswick received high cultural commendation, as they were from young trees planted late in 1896. But for the fact that the fruits came from the Society's gardens a silver Knightian medal would have been awarded. St. Joseph Strawberry from three sources received an award of merit for its autumn and free-fruiting properties, but the flavour is poor. It offers, however, a tempting subject for cross fertilisation in the hope of importing quality to the fruit.—A. D.—[With regard to the R.H.S. medals, our report was in accordance with the official list, and so far we have had no complaints from the firms interested. If our Norwood and Forest Hill friends gained the higher award we have only to add that they deserved it.]

Seedling Strawberries.—I have read with interest your notice of Messrs. Laxton Bros.' strawberry grounds. It seems surprising that so huge an effort should apparently produce so little that is good. Of all the varieties put into commerce by the present Messrs. Laxton, or their father, only two stand out with marked prominence. These are Royal Sovereign, the very best variety put into commerce during the past twenty years; and Latest of All. Noble has been grown only for its earliness and the size of its soft, watery, flavourless fruits. It is now generally neglected for Royal Sovereign. I do not mention these things as a reflection on anyone, but simply to show how, in strawberry raising, there is much cry and very little wool. It is feared that the efforts so freely made to produce fruits of great size have had much to do with this comparatively poor result. Not a few new ones have been exhibited to display cropping quality. I do not know that there is much room for advance in that direction; many of our old varieties when well done are just as heavy croppers as are the best new ones. Curiously enough, when looking over the trials at Chiswick these very heavy crops have not been so apparent. If there were less of seeking after size and more of striving for real table excellence some gain might result. Veitchs' Perfection gave delicious flavour, but so far it does not seem to be a great cropper or a good grower. Their Prolific, if in the future it proves to be what so far it has seemed—good robust constitution and heavy cropping—should become a standard variety, because its flavour is admirable, but it is not a grand looking fruit. It is a variety more for the lover of excellence than for the market grower. However, it may be assumed, seeing how strawberries have come and gone during the last fifty years, that we must regard it as fortunate that we have obtained a Royal Sovereign to add to our limited list of really standard varieties.—A. D.

LONDON'S TREES.

PUBLIC attention has recently been directed in the columns of a daily contemporary, we are glad to state, to the paucity of trees in the streets of London, and to the lack of shade from which foot-passengers suffer during the summer solstice throughout the highways and byeways of this gigantic city in consequence of that unfortunate circumstance. We are assured by one venerable adage that "experience teaches," and admonished by another that "prevention is better than cure." If the distressing experiences of excessive heat lately acquired by Londoners of every social class have not convincingly proved the wisdom of the latter apophthegm, we can only conclude that the metropolitan public is at once deaf to the appeals of pure reason, indifferent to sound advice, and insensible to physical discomfort. It must surely be obvious to the dullest apprehension that the terrors of such a heat-wave as mercilessly swept over this country during August, scorching our soil, staunching our springs, and enfeebling our energies, could effectively be abated by an abundant provision of shade in the broader thoroughfares of our chief commercial centres—especially in those of our huge and densely-populated capital. Nature, the all-wise and foreseeing, has shown shortsighted man how this kindly shade may be surely procured and cheaply maintained. Among the beneficent wonders of which she is prodigal, and which we complacently accept without understanding them, are trees—trees infinite in the variety of their service to mankind, in the beauty of their stateliness or gracefulness, in the "nuances" of their many-hued foliage, and in the picturesque charm which they impart to commonplace scenes as well as to romantic landscapes. In order to purify the vitiated atmosphere of our crowded towns, and afford to their inhabitants the most efficient and pleasurable of shelters against the burning heat and dazzling glare of the sun's rays at high summer-tide, all that we have to do is to line at least one side of our principal streets with avenues of forest trees, taking intelligent measures to foster the growth and conserve the health of these verdant "protectors of the poor."

Our much-decried climate, by reason of its prevalent humidity, is exceptionally favourable to the rapid development and robust longevity of the trees. There is no part of London in which they will not thrive luxuriantly, if planted "secundum artem" and judiciously attended to during the extreme severities of hot or cold weather. The trees that fringe the Thames Embankment were mere saplings a few years ago. How they flourish at the present day, and what an adornment they are to the noblest of European promenades! London can boast of no improvement at once more decorative and more useful than the long rows of lindens and chestnuts that flank the trottoirs of the Old and New Kent Roads and a few other transpontine boulevards, the after-dark retail trade of which, with all its bustle and clamour, is refreshingly set in a gay green frame, animate with gleams of sparkling light and murmurs of rustling foliage. Why should these summer attractions be wanting to Oxford Street and Holborn, the Strand and Fleet Street, Pall Mall and Piccadilly, Regent Street and Portland Place—to our great East-end arteries of commerce, which, by their imposing width and length, are eminently qualified for conversion into superb umbrageous avenues? In foreign capitals, streets corresponding in commercial importance to these metropolitan thoroughfares are for the most part generously lined with healthy trees, and liberally provided with sitting accommodation; while a weary pedestrian in London, outside the public parks, the Embankment, and a few suburban high roads may ask till he is hoarse where, save in a public-house—and not always there—he can rest his limbs without incurring an obligation to purchase something which he does not want, and Echo will invariably answer "Where?" Even in the most fatiguing weather, no other reply to his piteous inquiry is forthcoming. It is not so in Paris, Vienna, Berlin, or any of the great Italian cities, or provincial French, German, and Austrian towns, where free seats, in boulevards and avenues alike, are as numerous as shade is plentiful.

Nor are the suburbs of Continental capitals less comfortably equipped in these respects than the central districts, which were correctly termed intramural not so very long ago, but are now no longer engirdled by rigid cinctures of ramparts, bastions, and fortified gates. All the faubourgs of Paris are lavishly planted and agreeably shady. So are the "Vorstädte" of Berlin, from Tegel in the north to Tempelhof in the south, Charlottenburg in particular, the chief western suburb of "Modern Athens," being a stately complex of leafy boulevards. So are the outer "Bezirke" of Vienna—the Leopoldstadt, the Wieden, Mariahilf, Lerchenfeld, and the rest, nowadays only parted from the "Alte Stadt" by the mighty Ring and the broad, fast-flowing Danube Canal, a turbulent loop of the giant river that is navigable from above Ratisbon to the Black Sea. Single trees, moreover, often of great size and considerable antiquity, are freely scattered about the narrower streets of Berlin, dotting the old lines of demarcation between the side-walks and the former "Rinnsteine" or open gutters, once only covered in at crossings, and now replaced by subterranean drains hidden away under solid kerbstones. The stray trees have been carefully preserved in several of the older side-streets, as, for instance, in the Behrenstrasse, Charlottenstrasse, and "prolonged" Friedrichstrasse, and to this day constitute gay oases of verdure in dismal deserts of stone and stucco. Germans of all varieties are steadfast respectors of trees in town or country, park or forest, "Lustgarten" or "Biergarten," regarding them not only as pre-eminently ornamental, but as useful instruments of sanitation and appliances of open-air comfort. They know how to treat them, and derive the utmost gratification from sitting under the shade of their wide-spreading branches when the mercury is rising to inordinate heights in its crystal tube, and the air seems to quiver in tremulous protest against the extravagant heat pervading it. In respect to the assiduous cultivation of trees in our urban thoroughfares, we Britons cannot do better than follow the sensible example set to us by our Teutonic kinsfolk, who contrive to get a great deal more genuine enjoyment out of street-life than we do, although we are apt to consider ourselves by far the most practical people on the face of the habitable globe.

CALL DUCKS.

THESE birds are in reality bantam specimens of the Aylesbury and Rouen varieties. Their name is derived from the fact that they keep up a ceaseless quacking, just such as would attract the attention of birds flying overhead. They have also been called the Decoy Duck, as they were used at one period for drawing wild ducks into the meshes of fowlers. They are a hardy, attractive kind of duck, but from their active nature cannot be caught if kept on a large sheet of water, but must be shot if they are to be killed. There are two varieties of the breed, the white and the grey, the former resembling the Aylesbury, and the latter the Rouen, or, more properly speaking, the wild duck. The Call Duck is short, round, and compact, with full and high forehead. The wings are long, reaching to the end of the tail feathers, thus making them strong and rapid flyers. Call Ducks do not receive much attention from amateurs, who, if they desire a small variety of duck, go in for some of the richer-coloured breeds; besides which, the Call looks very "homely," to use an American expression.

E. B.

Work for the Week.

COOL ORCHIDS.

ATTENTION must now be paid to cleansing the plants and houses, putting everything in a condition to pass the greater portion of the winter months. All the light obtainable will now be necessary for the well-being of the plants, and to obtain this the glass should be thoroughly scrubbed outside as well as in so as to remove the coat of dirt that has settled on it; the inside woodwork should be well cleaned with soft soap, making all sweet and clean, this being done the plants should be sponged, using some safe insecticide, and taking care not to use it too strong. The cleaning of plants is a work which must be done carefully, as newly-potted plants are easily loosened in their pots, and in such a condition it is impossible for them to make satisfactory progress; then, again, if the plants are not carefully handled the centre leaf of the new growth is sometimes pulled out, or the leaves cracked and broken, which gives them an unsightly appearance. After being sponged and their pots washed the plants should be so arranged that each one will have its equal share of light; place all hanging plants out of the reach of direct draught from the top ventilators. With regard to the damping of the houses, once a day will in most cases be sufficient, this being done in the morning, providing the weather is mild, and no artificial heat is necessary. Should the nights be frosty and a little fire heat necessary, damping down will be required twice daily as the atmosphere will dry more quickly; shading can now be dispensed with altogether, there not being sufficient power in the sun to do any harm.

There are a number of orchids that have occupied positions in the cool house during the summer months that will be much better for a little extra warmth during winter, and as the nights are becoming colder, these should now be removed, and suitable positions found for them. Plants of Miltonia vexillaria should be placed in the most airy part of the house, as it delights in plenty of fresh air. Dendrobium infundibulum and D. Jamesianum should be given a light position to help them to finish up their growths, also Lælia præstans which are now showing for flower. Among the oncidiums are O. ornithorhynchum, O. incurvum, O. phymatochilum, O. tigrinum, O. varicosum, and its fine variety, Rogersi, Odontoglossum Krameri, O. cirrhosum, O. Harryanum, O. nævium, Masdevallia tovarenseis, and all of the Chimæra section. Vanda Kimballiana and Ærides japonica, are also much better wintered in a warmer temperature. Cypripedium Charlesworthi, C. purpuratum, C. Arthureanum, C. Spicerianum, C. insigne, and its varieties are now showing flower buds, and should be supplied with plenty of moisture at the roots, the latter being also much benefited at this season by occasional doses of weak liquid manure, especially large specimens that have their pots filled with roots.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

THE first fortnight in October is generally an anxious time for the plant grower, as arrangements have to be made for housing a large portion of his stock, which for some months has either been standing in the open or in cold pits. By this time the last of the chrysanthemums will have been safely housed, and where these were put under cover hurriedly to escape frost their rearrangements often becomes necessary, especially when grown for the production of exhibition flowers, while again those plants of the latest varieties which are so valued for decoration at Christmas and onwards, should be kept by themselves, if possible, and receive such treatment as is calculated to retard the flowers. Over crowding should be avoided, as however well the plants may bloom half their attractiveness is lost should they be minus healthy foliage down to the rim of the pots. Chrysanthemums require careful handling when first brought under cover, as this is a sudden change to what they have been accustomed to, especially in not having the night dews, which proves so invigorating to the leaves This, to a certain extent, may be substituted, by slightly dewing the foliage overhead during bright afternoons, but we are not in favour of carrying this to excess, as with less sun and a descending temperature almost nightly there is a danger of setting up the much dreaded mildew if the leaves are dripping with moisture at nightfall. Careful watering and judicious feeding will also claim attention to secure the best results. Other things, however, must not be neglected, and if not already done, the stock of violets which have been prepared for flowering in frames should be lifted and placed in their winter quarters at once. It has been a trying summer for these moisture loving plants. We delayed the planting of ours until we received the much needed rain. Fortunately the plants were put out last March in a position where they were shielded from the fierce rays of the sun by tall fig trees. With one or two waterings and frequent syringings at sunset, the plants pulled through the trying ordeal, and they are now planted in frames and pits free of red spider with every promise of flowering profusely. No better place can be found for these favourite flowers than in frames on old hotbeds. Additional soil or leaves should be placed in the frames, so as to bring the plants near the glass. The outside of the frames can then be banked round with leaves and long litter which not only wards off frost and drying winds, but a gentle warmth is set up, which, together with the ammonia arising from the manure stimulates growth and keeps red spider at bay, which is not easy when the plants are grown in light, airy houses. The sashes, of course, will have to be brought into use when the condition of the weather necessitates it, but until then full exposure is best. In planting the stock preserve all the best side shoots or runners. Trim these up and dibble them in sandy soil either in a shallow frame or boxes. In March these will have made capital stuff for planting out, and if necessary the old plants may be destroyed.

Arums must be brought under cover, but it is only necessary to exclude frost from these, therefore a cold pit which can be covered with mats will be all that is required to suit them. In handling the pots see that the drainage is clear, and should worms have gained an entrance, dislodge these by watering with lime-water. Plants that are well established, and whose pots are full of roots, may be placed in a warm greenhouse near the glass, and they will throw up some early spathes. It is a mistake to place bouvardias in a warm house direct from the open. This is sure to encourage the formation of weak shoots, and the flowers produced on the extremities will be of poor quality, and fail to last the usual length of time when cut. Placed in the cool greenhouse, they prove more satisfactory. Poinsettias, although considered as stove plants, are managed much better by cool treatment until just before the bracts form, when additional warmth assists to develop them. From the time the cuttings were rooted in a very gentle hotbed at the end of June until the present time, they have been grown in a cool, airy pit, with the full force of the sun. Being thinly arranged, they remain sturdy and retain their leaves. Now is the time to commence feeding the roots of these. It would serve no good purpose to allow camellias and Azalea indica to remain outside longer, although they can withstand a few degrees of frost; gales would be continually blowing them over, with the risk of breaking their pots. See that the latter are scrubbed and the drainage free before taking them in. The azaleas might be laid on their side and every part of the plants syringed with some solution to destroy thrip, should any have gained a foothold, or as a preventive. Bedding and other half-hardy plants should be placed under glass, allowing plenty of air and excluding damp from the former, or many may be lost.—RICHARD PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

THE importance of doing work at the proper time during this season of the year should on no account be overlooked. A few days in the spring either in sowing or planting makes but little difference to the crop, but at this time of the year it is all important that the work be done at the right time, as unfavourable weather may set in and so delay the operations still further. The storing of all roots should now be completed without delay, more especially the tender kinds. After the crops have been gathered in, manure the ground and turn it up roughly that the frost and air may act upon it during the winter. This is all important, for when the work is delayed till the soil has become saturated with rain it is not advisable to turn it up in that condition. Autumn digging is always best on light soils, particularly in those districts where the rainfall is slight, and if heavy soils be turned up at this time of the year before they become too wet, the work in spring at the time of sowing will be greatly reduced. It is, however, not advisable to dig such stiff land at the present time as is intended for very early crops, as there would be some difficulty in getting upon it to sow the seeds at the proper time; such plots are best left until the time of planting or sowing, which could be done as digging proceeds.

Protection must now be afforded to all tender crops such as peas and French beans. The former ought to have a free circulation of air both night and day by allowing the lights to be tilted both top and bottom; the latter will thrive very well in a little closer atmosphere where fire heat is applied, but it is not well to push them on too fast, as the pods will remain longer in good condition in a lower temperature. Sowings for succession should be made at intervals of every two or three weeks, for as the days become shorter growth will be less active, and the flowers will not set so freely. Cauliflower plants raised from seed sown in the open during the last month should now be pricked out in a cold frame where they can be protected should bad weather set in. Those possessing hand-lights may put five plants under each light, or more if the others are taken away in spring before growth commences. Both Brown cos and the hardy cabbage lettuce should be planted in frames for protection, and more may be pricked out in a warm sheltered border. Where Queen onions are grown these should now be large enough for transplanting. This, in my opinion, is by far the most useful variety for autumn sowing, as when transplanted at this time of the year they turn in so quickly in spring that useful bulbs are obtained early in May. Pay every attention to keeping small plants free from weeds, as these have a tendency to induce spindly growth that is very liable to injury in case of severe weather.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

FIG trees grown under the extension system should now be pruned, as the removal of surplus wood and leaves will help the growths retained to finish up well. The method I advocate and practice is to cut out bodily all the longest branches that can be spared, thus keeping the trees within the limits of space that can be allowed. This does away with all need for foreshortening, and the gaps made by removing the branches can be filled up when retying the trees after they are cleaned. Under this system very old trees can be easily filled out with young wood, so that there is never any necessity to retain anything in the shape of big branches, which are difficult to deal with, and fill up space which might be better occupied. When the branches have been cut out, all that remains for the knife to do is to cut away all fore-right and any other shoots that would be superfluous and awkward to bring into position. Such shoots make capital cuttings, root freely, and soon make good plants if any are required; so a few of the best should be retained and inserted about five inches deep in eight-inch pots, well drained and filled with sandy soil, placing them in a cold frame to winter, and keeping the soil somewhat dry, so that they shall not commence growth until the days begin to lengthen again.

Planted-out figs are often relegated to the back walls of houses which have the roof occupied with vines or something of the sort, but this is not fair treatment, and though they are expected to crop under such conditions the expectation is rarely realised in anything like a satisfactory manner. Figs deserve, and ought to have, a full supply of light, and the best way of providing for them is to train them fan-shaped on wires, at a convenient distance from the roof-glass, where they are made the chief occupants of the house, and receive what they want. Gross growing trees which cast their fruits may now be taken in hand and root-pruned, cutting away all roots that go down into the subsoil. If the soil in which they have been growing is very rich, it should either be replaced with poorer material, or treated to a goodly quantity of mortar rubbish, broken brick, and burnt earth, which should be rammed in as firmly as possible. This will prevent grossness in the future, and greatly assist the trees in carrying heavy crops. Highly manuring the soil for fig trees is the greatest of all possible mistakes; all the food they require should be given in liquid form during the growing season. Pot trees for early forcing are carrying their leaves longer than usual this year, but this is no evidence of unripeness, and I always look for the best results after the leaves have held on well, provided the wood is not too green. For some few weeks yet, such trees will enjoy their outdoor quarters; a touch or two from slight frost completes the process of preparation for another season, and does good rather than harm. All who are looking out for a grand forcing fig should get S. John's, one of the most certain of croppers.

Pot strawberries should be set out more thinly if they appear to be crowding each other, Royal Sovereign especially requiring plenty of room. Even if they do not require moving on account of space, it does good to shift them about, and prevents the roots from growing through the pots into the ashes. Loam for potting and planting should be cut and stacked as soon as possible now, but in most districts it will be necessary to wait for rain, the ground being so very dry. It is not wise, however, to allow very much rain to fall before commencing, as this washes out the goodness from the top spit.—J. C. TALLACK, *Livermere Park Gardens.*

"**Il crisantemo**" is the title by which the quarterly official organ of the newly-founded Italian Chrysanthemum Society will be known. No. 2 is just to hand, and, if it may be taken as a sample of what we may expect in future, promises to be an interesting addition to the various foreign periodical publications on the flower. It consists of twenty-four pages of printed matter entirely devoted to the society's records, and to articles on the history and cultivation of the popular flower. Our excellent friend, Mr. Briscoe Ironside, and his Italian colleagues are to be congratulated on the new undertaking, which certainly looks like a promising one.—C. H. P.

EXHIBITIONS AND MEETINGS.

ROYAL HORTICULTURAL SOCIETY, October 11.

THERE was a most interesting display of flowers, plants, fruits, and vegetables on the above date at the Drill Hall; indeed, the visitors were agreeably surprised to see such a number of large and varied exhibits.

FLORAL COMMITTEE.

As usual, the bulk of the exhibits came before this committee for consideration. Roses, nepenthes, perennial asters, greenhouse rhododendrons, and winter-flowering begonias were the leading subjects on view. Novelties were somewhat scarce. A charming group of warm greenhouse rhododendrons, staged by Messrs. J. Veitch and Sons, demonstrated—if demonstration be now necessary—the great beauty and usefulness of these hard-wooded plants for autumn flowering. A few of the most telling varieties were Hercules, Souvenir de J. H. Mangles, Apollo, Lord Wolseley, Mrs. J. Heal, Virgil, and Ajax; silver Banksian medal. A silver Flora medal was awarded to Messrs. Paul and Son, Cheshunt, for their exhibit of roses, both cut flowers and plants in pots. There were charming baskets of Maman Cochet, Madame P. Cochet, Ulrich Brunner, Madame A. Chatenay, and Gustave Regis. The Messrs. Paul also sent some neat and freely flowered plants of Masdevallia tovarensis, staging these and Cypripedium Spicerianum with the roses, edging the whole with ferns. The interesting Acalypha Sanderi was sent by Messrs. F. Sander and Co., St. Albans; Dracæna Godseffiana was good, and so also was D. Sanderiana; Cattleya Mantini inversa, Saccolabium Penangiana, Stenoglottis longifolia, Oncidium Jonesi, and Miltonia vexillaria Leopoldi were orchids staged amid the foliage plants.

One of the most effective and attractive exhibits in the hall was that of nepenthes, staged by Mr. G. Wythes, gardener to Earl Percy, Syon House, Brentford. There were thirty distinct forms, including species, varieties, and hybrids, and these were set upon stands so as to exhibit their pitchers to the best advantage; Cocos plumosus was arranged down the centre of the group, while under the plants were ferns of various kinds. Some of the finest speciments were of N. mixta, N. Curtisi superba, N. Mastersiana, N. Amesiana, N. Chelsoni, N. sanguinea, N. Morganiæ, N. Wrigleyana, N. Veitchi, and N. Wittei; silver-gilt Flora medal. Mr. A. B. May, Edmonton, had a splendid exhibit of beautifully-grown specimens of Begonia Gloire de Lorraine, one of the finest of begonias for winter flowering, especially as grown by Mr. May. Adiantums in variety, nephrolepis and Lygodium scandens served to make a suitable and elegant setting for the begonias; silver-gilt Flora medal. Mr. George Prince, Oxford, had a small but very pretty exhibit of tea scented roses. There were some lovely flowers of Maman Cochet and The Bride Mr. T. S. Ware, Tottenham, sent a few bunches of showy single dahlias, an assortment of Michaelmas daisies, helianthus and flowering plants of nerine rosea, N. Planti, N. Fothergilli, and N. Mrs. Fell.

A large exhibit of roses from Messrs. W. Paul and Son, Waltham Cross, served to show how open and warm the season is. There was a good show of pot roses, Queen Olga of Greece, a new blush tea rose, Niphetos, Enchantress, and Innocente Pirola being conspicuously good. There were good bunches of Mrs. W. J. Grant, Gustave Piganeau, Maman Cochet, Mrs. Sharman Crawford, Caroline Testout, and W. F. Bennett. A silver Flora medal was granted. Physalis Franchetti, the finest of all the winter cherries, was largely and well shown by Messrs. J. Veitch and Sons, Chelsea; this exhibit was a great attraction, for its huge scarlet balloon-like calyces are most effective and useful for winter decoration; silver Banksian medal. Mr. W. Allan, gardener to Lord Suffield, Gunton Park, sent some very fine spikes of Tritoma grandis; the flowers are gathered thickly together at the head of the spikes, making a thicker head than in most tritomas. Anthurium crystallinum illustris is a highly variegated aroid apparently of lesser growth than the type; the deep green ground colour is finely coloured with white or rich cream colour; an extremely bright and handsome foliage plant. The Messrs. Veitch showed Dracæna Eeckhanti, a pretty dracæna with gracefully recurved foliage; they also sent Alocasia spectabilis, a form with greyish mottlings and veinings on a dark slatey-green ground. Mr. W. Wells showed Jules Mary chrysanthemum, a rich crimson early variety that was greatly admired. Some flowers of the rather rare Trichinium Manglesi came from Mr. F. W. Moore, Glasnevin.

A silver Flora medal was awarded to Messrs. J. Veitch and Sons, Chelsea, for a grand group of Michaelmas daisies associated with spikes of Tritoma corallina; the asters were shown in fine large clumps of a size sufficient to illustrate the habit of the variety. A. amellus, A. ericoides, A. densus, A. acris, A. cærulescens, A. Coombe Fishacre, A. cordifolius, and A. panculatus were especially well represented. Mr. W. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking, sent some late spikes of beautiful pentstemon seedlings; also Lobelias Carmine Gem, Queen Victoria, Crimson Gem, and Prince Arthur, all fine attractive sorts.

ORCHID COMMITTEE.

Messrs. J. Veitch and Sons, Chelsea, staged a few well-grown specimens of Lælio-cattleya callistoglossa ignescens, L.-c. Dominiana, a grand hybrid with huge, rich, purple lip; L.-c. Nysa, always admired; Lælia splendens, the fine cross between L. crispa and L. purpurata, and Dendrobium rhodostoma, obtained by crossing D. Haltoni with D. sanguineolenta. From Messrs. Charlesworth and Co., Bradford, came a small flowered but pretty hybrid orchid named Sophro-cattleya Cleopatra, obtained by crossing Sophronitis grandiflora and Cattleya guttata Leopoldi; this has rosy scarlet sepals and petals, and a yellow stained lip. Mr. J. Howes, gardener to Walter Cobb, Esq., Dulcote, Tunbridge Wells, showed a splendid example of Vanda Sanderiana, carrying fine spikes, and a total of about four dozen flowers and buds; the variety was the very best, and the size of the flowers was almost exceptional; Mr. Howes also sent a deep-coloured form of Cypripedium Lawrebel named Dulcotense. Mr. C. Whitlock, gardener to W. A. Belney, Esq., Fir Grange, Weybridge, sent two small pans of Lælia præstans, splendidly flowered.

Lælio-cattleya Henry Greenwood was exhibited by Messrs. B. S. Williams and Son, Upper Holloway; this is a beautiful orchid and referred to by us in connexion with the Ghent Show held early in the year; this orchid is stated to be the result of crossing Lælio-cattleya Schilleriana and Cattleya Hardyana. The Messrs. Williams showed Vanda concolor and a fine variety of Cypripedium Charlesworthi. Mr. F. Fullerton, gardener to B. B. Baker, Esq., Roupell Park, sent a specimen of Odontoglossum grande carrying seven spikes and twenty-five flowers.

Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, showed five plants of Cypripedium Lawrebel, these carrying ten very fine blooms; there were numerous examples of Habenaria militaris with spikes of rich flowers; spikes of Cattleya exoniensis, very gay for this season of the year; Dendrobium Phalænopsis alba, Lælia pumila, L. præstans, the quaint Epidendrum porphyreum, and Miltonia Lamarckiana, a cross between M. candida and M. Clowesi. Messrs. Hugh Low and Co.'s contribution contained some bright spikes of the good old Cattleya Bowringiana, Ondontoglossum grande, Cymbidium Traceyanum, carrying nine splendid flowers, well marked; Oncidium ornithorhynchum album, Vanda cærulea, V. Kimballiana, and Cattleya superba splendens with intensely-coloured blooms; bronze Banksian medal.

Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton, secured a silver-gilt Flora medal for a very handsome group of beautifully flowered plants of Dendrobium formosum giganteum; the batch of thirty-four plants carried an aggregate of six hundred and seventy-five substantial flowers. There were two spikes on most of the growths, and in some cases three; the largest number of flowers on one plant was sixty-four, and one four growths. On one plant there were thirty-three blooms. Mr. Elphinstone, gardener to E. Miller Mundy, Esq., Shipley Hall, Derby, sent Angræcum ichneumoneum, a quaint orchid with long spikes of transparent and pale green flowers, like flies on a twig, and Dendrobium puniceum.

FRUIT COMMITTEE.

Mr. A. H. Rickwood, gardener to the Dowager Lady Freake, Teddington, was awarded a silver Knightian medal for a collection of apples and pears; the fruits were not over large, but quite large enough to be generally useful; all the examples were clean and shapely, the pears especially so. A silver-gilt Knightian medal was won by Mr. C. Blick, gardener to Martin R. Smith, Esq., The Warren, Hayes, Kent, who staged a first-rate exhibit of three dozen dishes of handsome and well-developed pears; Pitmaston Duchess, Marie Louise d'Uccle, Durondeau, Duchesse d'Angoulême, Doyenne du Comice, Souvenir du Congrés, Doyenne Boussoch, and President Drouard were especially fine.

Messrs. G. Bunyard and Co., Maidstone, put up a splendid exhibit of a hundred dishes of cooking apples, securing a silver-gilt Knightian medal; Mère de Ménage, Hereford Beefing, Peasgood's Nonesuch, Beauty of Kent, Flanders Pippin, Cellini, Striped Beefing, and Belle de Pontoise were finely represented.

Mr. W. Allan, Gunton Park Gardens, showed new melons, gaining an award of merit for a scarlet-fleshed variety, named Gunton Scarlet. Captain C. J. Shephard, Maidstone, sent specimens of Princess May, a new seedling peach from the Victoria nectarine. Messrs. R. Veitch and Sons, Chelsea, showed a very fine pebble-shaped potato named Walter Raleigh. Seedling apples were shown by several exhibitors, and those gaining awards are described in another column.

Messrs. H. Cannell and Sons, Swanley, Kent, put up a first-class display of onions in some twenty-six varieties; these were all grand bulbs, and yet produced by farm culture; Cannell's A1, Lord Keeper, Ailsa Craig, Rousham Park Hero, Cranston's Excelsior, and Masterpiece were among the finest; silver Knightian medal. Mr. R. W. Green, Wisbech, secured a silver Banksian medal for his display of twenty six dishes of excellent potatos; Snowdrop, Duke of York, Clark's Main Crop, Sutton's Abundance, Sutton's Satisfaction, The Saxon, and Up-to-date attracted our attention by reason of their clean appearance.

NATIONAL CHRYSANTHEMUM SOCIETY, October 11, 12, and 13.

THE show held at the Royal Aquarium on the above dates was a great success, as the display was largely increased beyond its usual size by Mr. Deverill's vegetable competition and the non-competitive exhibits chiefly from trade growers.

The best group of chrysanthemums was that staged by Mr. J. Spink, Walthamstow, who had dwarf plants carrying fine flowers, arranged with Cocos Weddelliana crotons, Phrynium variegatum, ferns, &c.; Mr. Spink had carefully avoided overcrowding. The second prize fell to Mr. W. Howe, gardener to Sir H. Tate, Streatham Common, who showed much taller plants than Mr. Spink.

The competition in the class for two dozen blooms, Japanese, in not less than eighteen varieties, was good, the chief award being secured by Mr. James Brookes, gardener to W. J. Newman, Esq., Totteridge Park, Herts, who had grand examples of Madame G. Henry, Elthorne Beauty, Sunstone, Oceana, Mutual Friend, Mrs. G. W. Palmer, Mrs. H. Payne, W. Seward, Emily Silsbury, John Seward, Mons. A. Moulin, Ella Curtis, Reine d'Angleterre, Edith Tabor, W. H. Tucker, Vis. R. de Cheyelles, Phœbus, and Australia; Mr. H. Shoesmith, Claremont Nurseries, was placed second; while Mr. R. Jones, gardener to C. A. Smith Ryland, Esq., Barford Hill, Warwick, gained third place. The chief honours for twelve Japanese blooms were secured by Mr. J. Fulford, gardener to F. D. Lambert, Esq., J.P., Moor Hall, Cookham, who staged first-rate flowers of Mrs. J. Shrimpton, Mrs. J. Lewis, Oceana, Mons. Panckoucke, Dorothy Seward, Elthorne Beauty, Mons. G. Biron, Reine d'Angleterre, Mrs. F. Brewer, Ella Curtis, Iserthe, and a white Seedling; Mr. R. Jones, Warwick, came second; and Mr. J. Brookes, third.

For six Japanese blooms one variety, Nr. R. Gladwell, gardener to Sydney Smith, Esq., Wernder Hall, South Norwood, scored a first with Madame G. Bruant, very large blooms; Mr. J. Brooks, second, with Madame G. Henry; and Mr. B. N. Nash, Woking, third, with Edith Tabor. The best six incurved blooms were examples of Mr. R. Bahaunt, Baron Hirsch, and D. B. Crane, submitted by Mr. Robert Bassil, gardener to D. H. Evans, Esq., Shorter's Hill House, Pangbourne; Mr. T. Robinson, gardener to W. Lawrence, Esq., Hollingbourne, second; and Mr. R. Jones, Warwick, third. Mr. Cook, of Hendon, was awarded a second prize for his set of twelve bunches of pompon varieties. Mr. Turk had the best six bunches of pompon chrysanthemums, showing good flowers of Nellie Rainford, Yesuve, Osires, Madame E. Dordan, La Vogue, and Veuve Clicquot; Mr. G. Debenham, St. Albans, second; and Mr. Cook, third. Messrs. Debenham, Mr. E. W. Coote, and Mr. A. Taylor also secured prizes for pompon chrysanthemums.

Mr. D. B. Crane, Woodview Terrace, Highgate, led for three epergnes of chrysanthemums, using, as is his wont, orange, crimson, and yellow chrysanthemums, such as Ivy Stark, Percy's Seedling, and Harvest Home, with croton leaves and autumn-tinted foliage; although the best set, we did not think these epergnes were quite up to Mr. Crane's best efforts; Mrs. W. Green, jun., Harold Wood, Essex, second; and Mr. J. R. Chard, Stoke Newington, third. Mrs. W. Green, jun., led for a vase of pompon chrysanthemums; Mr. T. J. Turk, gardener to T. Boney, Esq., Southwood House, Highgate, second, with a large mass, in which wires and sticks were too evident to be pleasing; Mr. D. M. Hayler, gardener to Mrs. Langworthy, Geys House, Maidenhead, third. For the first prize for a pair of vases of chrysanthemums, large blooms, Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, scored with immense flowers of popular Japanese varieties, associated in big, handsome vases with ampelopsis and maple foliage; Mr. J. Brooks, second; and Mr. Norman Davis, Framfield, Sussex, third. For a single vase of chrysanthemums, Mr. D. B. Crane, Mr. A. Taylor, and Mr. D. M. Hayler secured the awards in the order mentioned. Miss N. Erlebach, assistant to Mr. J. R. Chard, Stoke Newington, gained first prize for a table of bouquets, wreaths, &c., these consisting chiefly of white, orange, yellow, or crimson varieties of early chrysanthemums; autumn-tinted foliage was used in a tasteful fashion with the flowers; Mr. J. Emberson, Walthamstow, was second.

Mr. Gladwell led for a dozen Japanese blooms in the amateurs' division, his best flowers being Madame G. Bruant, Phœbus, Louise, and Lady Byron. Mr. Gladwell was also first for six blooms, Japanese, distinct, with fair flowers of Madame G. Bruant, E. Molyneux, Mrs. C. H. Payne, Reine d'Angleterre, Madame G. Henry, and Phœbus; Mr. W. Perrin, Sawbridgeworth, second; and Mr. Turk, third. Mr. W. G. P. Clark, Hitchin, had the best dozen Japanese blooms, in six varieties; Mr. H. Love, Sandown, Isle of Wight, second. Mr. W. Amies, South Ashford, Kent, was awarded first prize for six Japanese blooms; Messrs. Clark and Love taking second and third places.

M. DEVERILL'S PRIZES.

Mr. Deverill held his annual vegetable exhibition in connection with this show.

The first prize for eight kinds of vegetables was won by Mr. E. Beckett, Aldenham House Gardens, Elstree, who had magnificent specimens of Ailsa Craig onions, Autumn Giant cauliflowers, Glenhurst Favourite tomatos, beet, Oxonian leeks, Intermediate carrots, Aylesbury Red celery, and Satisfaction potatos; Mr. R. Lye, gardener to Mrs. Kingsmill, Sydmonton Court, Newbury, a good second, with Mr. Pope, third; the competition was keen throughout. For Glenhurst Favourite tomatos, Mr. E. Beckett, Mr. T. Wilkins, and Mr. Bowerman, were placed first, second, and third respectively.

For a dozen specimens of Ailsa Craig onions Mr. W. Fife, Lockinge Gardens, Wantage, won first prize with grand bulbs weighing 30 lbs.; Mr. J. Masterson, Weston House Gardens, Shipton-on-Stour, second; and Mr. T. Wilkins, Henstridge, third. For six bulbs of this onion Mr. Fife was again first, his set weighing 14¾ lbs.; Mr. Masterson, second; and Mr. Wilkins, third. Mr. Fife showed the best twelve pedigree onions, staging bulbs of Lord Keeper that weighed 30¼ lbs. in the aggregate; Messrs. T. Wilkins and Keep came second and third. Mr. Wilkins had the best Wroxton Improved onions, Mr. Wyton, Garstang, coming second. In the class for a dozen bulbs of a pedigree onion, Mr. Beckett was placed first with Ailsa Craig weighing 21 lbs.; Mr. J. Bell, Berkhamsted, second.

Mr. Beckett scored for Aylesbury Prize Red celery, and Mr. D. Gibson, gardener to J. B. Johnston, Esq., Coombe Cottage, Kingston, showed the finest six leeks, the variety being Oxonian. Mr. Beckett and Mr. Bowerman were first and second respectively for Middleton Park Favourite beet with splendid roots. In the amateurs' class for a collection of vegetables, Mr. G. Wells, Kineton, Warwick, took first prize with good produce; Mr. Horton, near Warwick, second. Out of twenty sets of twelve carrots, Mr. J. Masterson won first place, showing Deverill's Intermediate; Mr. Wilkins, second; and Mr. N. Kneiler, Basingstoke, third. Mr. Beckett led for Hollow-crowned parsnips, Mr. Lye coming second.

NON-COMPETITIVE.

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, put up a large and exceedingly attractive group of chrysanthemums, breaking up the surface into artistic mounds, and tastefully associating the chrysanthemums with ferns, crotons, dracænas, palms, and bamboos; Lili Boutroy, a new white Japanese; Eastman Belle, a gold and crimson sport from Pres. Borel, were two new sorts that attracted attention; M. Fatzer was notably good, so also was the light crimson sport from Madame Marie Massé, a useful form for outdoor growth; Queen of the Earlies we noted as carrying fine large flowers, gold medal. Messrs. Cannell and Son, Swanley, put up a fine table of chrysanthemum flowers, with sprays of polygonum, salvias, &c. Mr. R. Owen, Maidenhead, gained a bronze medal for a few dozens of fine Japanese blooms, a white seedling named Countess Grey being notably good.

Mr. N. Davis was highly commended for a basket of an intense golden-coloured Japanese chrysanthemum, named Klondike, an October market variety. Mr. S. Mortimer, Rowledge, Farnham, was awarded a silver-gilt medal for a large and most interesting group of cactus show dahlias in fine condition. Mr. S. Robinson was awarded a bronze medal for cut chrysanthemums. Mr. W. J. Godfrey, Exmouth, Devon, brought up a large collection of Japanese blooms: President Bevan, Soliel d'Octobre, Le Grande Dragon, Mrs. J. P. Bryce, Queen of the Earlies (in large vases) and Madame P. Rivoire were especially good. Mr. Godfrey, who also sent a charming lot of carnation blooms in a great variety of colours was awarded a silver medal. Mr. J. R. Box showed double and single begonia blooms, arranged flatly, in boxes. Mrs. Wingfield, an early-flowering chrysanthemum of Japanese form, and producing an abundance of clear lilac-coloured blooms of a pale shade, and shown by Mr. Empson, Ampthill House Gardens, Bedford.

Mr. W. Wells, Earlswood, Redhill, put up a large group of chrysanthemums, making a groundwork of vases of early flowering varieties among which L'Imperatrice, M. Max Dufosse, Jeanne Willermet, Madam Carmeaux, Ivy Stark and Jules Mary were very attractive and all noteworthy. The general arrangement consisted of plants carrying one large bloom and Mdme. Gustave Henry was well represented, so also was Ella Curtis, Le Grande Dragon, and Mellissima: a silver gilt medal was awarded. Messrs. H. Cannell and Sons, Swanley, was awarded a silver medal for a showy group of the ever-useful cannas.

For an extensive display of apples and pears Messrs. S. Spooner and Son. Hounslow, were awarded a silver gilt medal. Mr. H. Berwick, Sidmouth, was awarded a silver gilt medal for a splendid exhibit of hard fruits and Belladonna lilies. Messrs. W. Cuthbush and Sons showed some fine pears, apples, onions, and carnations. Mr. H. Deverill, Cornhill, Banbury, gained a silver medal for his display of autumn flowers in great variety, perennial asters being very showy.

Mr. Fife showed a dozen wonderfully fine and handsome bulbs of a fine onion, Ne Plus Ultra; one bulb weighed 3 lbs. 10 ozs.; a new conical bulb named the Sirdar was also shown.

Mr. Norman Davis, Framfield, Sussex, put up one of the grandest displays of Michaelmas daisies we have ever seen. His group occupied a table about six feet wide by about fourteen yards long, and consisted of large bunches of almost all the varieties and species worth cultivating, arranged tastefully in vases. A few sprays of solidago brightened the other flowers. Mr. Davis has a fine form named Framfieldiense of Aster amellus, and he staged splendid sprays of Coombe Fishacre, A. ericoides, A. multiflorus, A. N. B. Apollo, A. cordifolius major, A. N. B. Circe, &c. A small gold medal was awarded. Mr. E. Beckett, gardener to Lord Aldenham, Elstree, gained a silver-gilt medal for a most interesting exhibit of Michaelmas daisies, representing an immense number of varieties; A. cordifolius major, A. c. elegans, and A. N. B. Nancy were splendid. Mr. Beckett had an unfortunate position for his exhibit, as all the sunshine that appeared fell upon his flowers and soon spoiled their beauty. Messrs. J. Laing and Sons, Forest Hill, sent a fine collection of apples, pears, nuts, medlars, pot-vines, &c., associated with plants and cratægus sprays; silver-gilt medal. Mr. T. S. Ware, Tottenham, gained a silver-gilt medal for a goodly show of cactus, pompon, and single dahlias, associated with bamboos, &c.

WOOLTON GARDENERS' IMPROVEMENT SOCIETY.

THE first meeting of this session was held on the 6th inst. at the Mechanics' Institute, Mr. R. W. Ker presiding over a fair attendance. The chairman, in opening the proceedings, remarked that the programme for the coming winter promised to be an excellent one, judging from the syllabus that had been placed in the hands of the members, which contained a varied and useful number of subjects of great importance to those engaged in horticulture. Mr. J. Wynne, of Waverton, Chester, read a paper on the "Culture of Vegetables for Exhibition Purposes," in which he stated that he was there to illustrate and give some practical information on an important subject in which three details must be present, viz., right soil, right stock, and right culture. The general preparation of the ground must include trenching, the ground two pits deep, and giving a liberal dressing of manure; the work to be done during the autumn and winter, so that the manure might be incorporated with the soil by seed-sowing time.

Taking the subjects alphabetically would bring them to beans, French, runner, and broad; there was not much to treat upon in this section, except to sow thinly and thin out deformed pods. Beet wanted special treatment for different varieties, Pregnell's requiring a rich soil, while Dickson's Exhibition proved most satisfactory in a poor compost. To sow beet, a long peg three feet in length and two inches in diameter at the top should be used, making a hole the full length of the peg, which should be filled with a compost of three parts sand and one of loam; seed time end of April or early in May. Cauliflowers, cabbage, savoy, and Brussel sprouts, if liable to club, apply a dressing of lime; if cauliflowers are too early partly sever the stem, or pull up the entire plant, insert in water and place in the dark. Carrots require richer soil than beet; the provision for sowing should be similar, but using a smaller peg. Artificial manures produce forked roots; syringing with soap suds to keep off fly, and gas tar on rags placed between the rows was advised. Celery should not be sown too early; the first week in March was recommended in a temperature of about 50 degrees; when the plants are up remove to cold pits or cooler house; prick off when fit, and place in warmth for a day or two to give the plants a fresh start. When planting out make them firm in shallow trenches; if they refuse to make headway, partly lift them, breaking the roots, after which make firm, and often growth will result immediately. Blanching should be done with paper, removing the same every four or five days to clear away any pests that may have worked their way inside; after a time rough bags can be used which should be kept moist to induce a quicker blanching. Leeks should be treated on similar lines to celery, but they cannot receive too much manure; plant deeply and use paper collars for blanching. In planting, make a deep hole, and fill in with sand. Onions require a deep, rich soil, and a layer of manure should be placed on the lower spit during trenching, which should be done in winter. Raise the plants in January in a little warmth, afterwards placing them in a cooler position; plant out in February or as soon as the ground will permit, and make the soil firm. To prevent an attack of grub use gas tar as advised for carrots. Parsnips should be sown in prepared holes as for carrots, only the peg should be larger and longer; sow about middle of February, and thin early. Peas should be sown twelve to fourteen weeks before required; Autocrat, a splendid variety, takes a fortnight longer than the Duchess. Sharpe's Queen and Gladstone (new) are good varieties. The Autocrat differs from many varieties, as the pod and peas both grow simultaneously, whereas in many the pods are full sized before the peas commence to swell. Watering in all sections must not be neglected. R. G. W.

ISLE OF WIGHT FRUIT SHOW.

There was a fine show at Newport on October 4, when no less than six hundred dishes of first-rate fruit were staged; one great point about the show was that not a single prize was offered. Messrs. J. Cheal and Sons, Crawley, had a fine display of apples and pears. Prominent among the pears were mammoth specimens of Pitmaston Duchess, Mr. Alderman Colenutt, J.P. (Ryde), being credited with sending the largest, and he was followed closely by Mr. W. H. Jacobs, gardener to Mr. Alderman W. H. Chatfeild Clarke; and other exhibitors sent meritorious specimens. The display from the garden of Captain Evelegh, Shide, gardener, Mr. W. Morris, included a rare dish for the season—red currants, and Mr. Munson, gardener to the Rev. E. Summers, Brading, also sent a dish of red currants. There were some fine specimens of Warner's King and Countess in the collection of apples sent by Lady Daly's gardener, Mr. G. Honeybourne, from Miss Mitchell's garden, Ventnor, while Mr. W. W. Sheath sent some exceptionally fine apples and pears. Newton Wonder, from S. P. Munford, Esq., Cowes, gardener, Mr. Hygate, were said to have surpassed anything at the Palace show. The collection from the Rev. R. L. Morris, Brook, was noteworthy for some superb Blue Imperatrice plums. Duke of York tomatos were sent from Sir Charles Seely's gardens, and Mr. Barkham, gardener to Mrs. Rylands, Haven Street, made melons and gourds a speciality. The collection of apples and pears from Mr. J. I. Thornycroft, Bembridge, was perfect, and some fine grapes were sent by Mr. R. Roach Pittis, J.P., and Mr. T. Brown, of Newport. Other prominent exhibitors were: Lord Fitzwilliam; Colonel Crozier, J.P., gardener, Mr. Kent; Captain Lyon, Sandown; Mr. E. V. Harcourt, St. Clare Castle, gardener, Mr. C. Meehan; Mr. Arthur Atherley, J.P., Landguard Manor; Mr. W. G. Young, Wootton; Mr. F. A. Joyce, Newport; Mr. H. Mortimer, J.P., Newport; Mr. H. Mitchell, J.P., Bonchurch; Lady Harrington, Cowes; Admiral Denison; and Mr. G. Williams, Gatcombe. Mr. J. J. Linington, Newport, exhibited two dwarf apple trees laden with fruit, showing the advantage of cultivation. Mr. Cave, of the Newport Nursery, lent some orchids, ferns, and other flowering and foliage plants for decorative purposes, and Messrs. W. A. Kent, Newchurch, and W. Matthews, Carisbrooke, sent dahlias.

READING GARDENERS' ASSOCIATION.

THE first meeting of the 1898-99 session was held on Monday evening last in the club-room at the Old Abbey Restaurant, Mr. Turton presiding over a good attendance of members. The subject for the evening was "A few Orchids that can be Grown with other Plants," introduced by Mr. W. P. Bound, of Bill Hill Gardens, Wokingham, and late of Messrs. Sanders, St. Albans. The lecturer took up the various species aud varieties suitable for different houses, and gave very valuable and practical advice as to their treatment from the time of the purchasing of the bulbs to the time they had done flowering, great importance being given to the buying of imported plants. An interesting discussion ensued, in which Messrs. Woolford, Neve, Townsend, Murrell, Dockerill, Martin, Parsons, Turton, and Alexander took part, which turned chiefly on whether the drawing-room was a suitable place for orchids, and if it is desirable to give manure directly to the plants. A hearty vote of thanks to Mr. Bound for his practical paper brought the meeting to a close. A splendidly flowered specimen of Miltonia Clowesi was shown by Mr. Lever, gardener to Leonard Sutton, Esq., Hillside.

ANSWERS TO CORRESPONDENTS

Wire Supports for Chrysanthemums.—G. P., Dorset: Your letter stating that you intended sending us a specimen of your invention reached us in due course. We are still waiting for the arrangement; did you send it, or was it overlooked?

Potassium Sulphide.—B. B., Sevenoaks: Sulphide of potassium, or potassium sulphide, is popularly known as Liver of Sulphur. It is obtainable at almost every chemist's shop, and is by no means expensive. The great thing to avoid is the substitution of *sulphate* of potassium for the sulphide; so, until you know the difference between the two, take care to ask for sulphide, so that the chemist cannot mistake your request. No doubt the various horticultural sundriesmen will be able and willing to supply the right article.

Black Rot on Tomatos.—F. J., Blackrock: The black patch at the apex of the tomato is due to a fungus known as *Macrosporium Tomato*. It is presumed that this finds a suitable ground for operation when, from any cause, the delicate ovary and style of the tomato flower becomes damaged after fertilisation has taken place. The presence of the fungus is made known by the black, rotting patches of flesh that usually appear when the fruit is about half ripe. A close atmosphere almost always ensures an attack, so the best preventive is a free circulation of air, an absence of all rank stimulants, and a dry, rather than a moist, atmosphere. Unfortunately, tomato plants are often predisposed to disease while young, owing to the anxiety of the cultivator to obtain large specimens as quickly as possible.

Names of Plants.—J. A. W.: 1, Ampelopsis quinquæfolia; 2, 3, and 5, send when in flower; 4, Vitis striata, also known as Ampelopsis sempervirens; 6, Spiræa Bumalda.

R. F. J., Anglesey: The yellow Banksian rose.

C. B. G., Exeter: 1, Tradescantia virginica; 2, Aster Novæ-Belgi densus; 3, A. ericoides; 4, A. Robert-Parker.

E. B., Tooting: An Ipomæ, a species not recognised, please send again.

A. D. M., Cheshunt: 1, Gleichenia Mendeli; 2, Pteris scaberula; 3, P. longifolia; 4, P. semipinnata; 5, Gymnogramma Matthewsi.

S. O., Reading: 1, Costus igneus; 2, Croton interruptus aureus; 3, Sanchezia nobilis; 4, Aphelandra aurantiaca.

C. H., Newport: 1, Eucalyptus globulus; 2, Eurya latifolia variegata.

Names of Fruits.—F. J., Blackrock: The pear is Beurre Superfin.

R. E. T., Milborne: 1, Blenheim Pippin; 2, Grange's Pearmain; 3, a poor specimen, not recognised; 4, Kerry Pippin; 5, Queen Caroline; 6, not recognised.

The mean reading of the Barometer during the week at Greenwich was 30·00 inches, and that of the Thermometer 56°·1, the latter being 3°·1 above the week's average in the 50 years 841—90. The direction of the wind was north easterly, the horizontal movement of the air being 7 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 18·3 hours. The measured rainfall amounted to 0·02 of an inch.

"THERE'S A CHIEL AMONG YE TAKIN' NOTES, AN' FAITH HE'LL PRINT 'EM," has now become a saying so familiar that no apology need be made for introducing it; especially as it is intimately associated with the Press, which has helped in publishing the value of Holloway's Pills and Ointment. "The chiel that had been takin' notes" for the past fifty years of the cures effected by these wonderful remedies, has frequently informed the public that they have no equal. He has noted where they have been successful when other medicines failed, and he has been particular in stating that at this period of the year they are especially useful, as they cure or relieve dysentery, diarrhœa, all stomach and bowel disorders, bile, and indigestion.—[ADVT.]

MARKETS.

Covent Garden.

THE supplies of both fruit and vegetables are only moderate, but the demand is steady, and good prices are obtained for the best goods. Hardy cut flowers are becoming scarcer each day. The potato trade shows a slight improvement.

FRUIT.—English apples, 4s. to 10s. per bushel; plums, 4s. to 6s. 6d.; damsons, 2s. 6d. to 3s. 6d.; blackberries, 4s. to 4s. 6d. per half-sieve; pineapples, 1s. 6d. to 5s. each; bananas, 5s. to 10s. per bunch; English grapes, 9d. to 2s.; Channel Island, 6d. to 1s. per lb.; Lisbon, 7s. to 12s. 6d. per case; Almeria, 10s. to 15s. per barrel; English pears, 5s. to 10s. per bushel; French, 2s. to 3s. 6d. per box; pomegranates, 4s. 6d. to 7s. 6d.; Spanish melons, 5s. to 7s.; lemons, 12s. to 20s. per case; green figs, 9d. to 1s. 6d.; peaches, 2s. to 8s. per dozen; English tomatos, 3s. to 4s.; Channel Island, 2s. 6d. to 3s. 6d. per 12 lb.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 2s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 3s to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. 6d. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Endive, 1s. to 2s.; lettuce, 9d. to 1s. 3d.; cucumbers, 2s. to 4s.; cauliflowers, 1s. to 2s. per dozen; Valencia onions, 5s. to 6s. 6d.; Ports, 5s. 6d. to 6s. 6d. per case; picklers, 2s. to 3s. 6d. per bag; eschallots, 1s. 3d. to 1s. 9d.; mushrooms, 5s. to 6s. per 12 lb.; parsley, 1s. 6d. to 2s.; turnips, 2s. 6d. to 3s. 6d.; carrots, 2s. to 3s.; leeks, 1s. 6d. per dozen bunches; beetroots, 2s. to 3s.; cabbages, 4s. to 7s. per tally; spinach, 2s. 6d. to 3s. 6d per bushel; marrows, 1s. 6d. to 2s. 6d. per dozen; potatos, 50s. to 90s. per ton.

Borough Potato Market.

Trade is still slow, and the supplies are about sufficient to meet it. Prices remain practically unaltered, but the cold weather will no doubt influence both trade and prices. Beauty of Hebron and Snowdrops, 3s. 6d. to 4s.; White Hebrons, Early Puritan, Bruce Magnum, Sutton's Early Regent, Reading Giants, and Imperators, 3s. to 3s. 6d.; Black Lands, 2s. 6d. to 2s. 9d. per cwt.

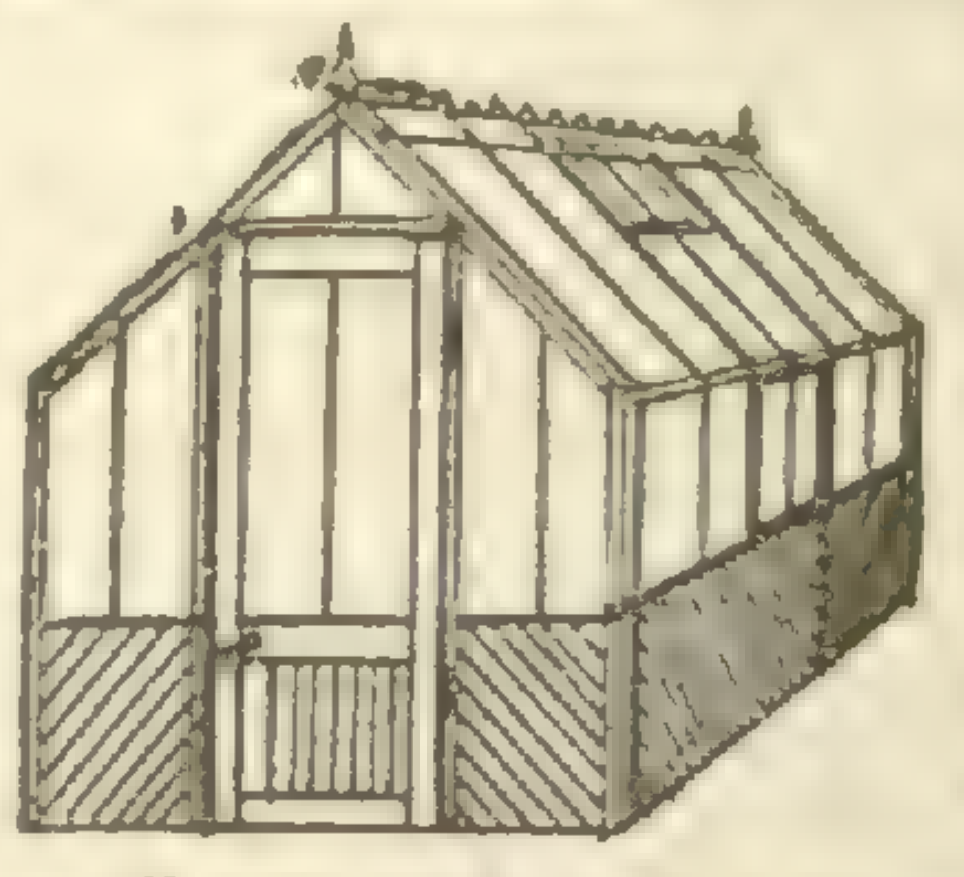
THOSE having Houses to Let or Sell, or Apartments to Let, whether in town or country, should send an advertisement to the "CITY PRESS." The paper is acknowledged by all to be one of the best mediums for this purpose. Prepaid terms: 32 words, One Shilling; three times for Two Shillings. Offices 148 and 149 Aldersgate Street London, E.C.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

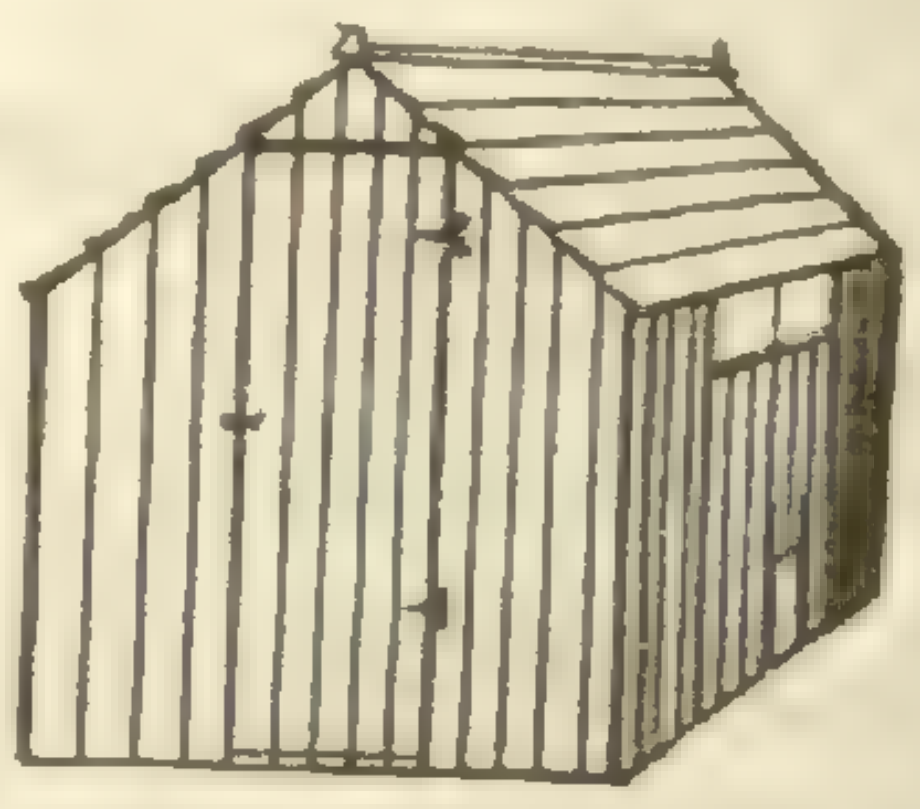


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72/6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more.

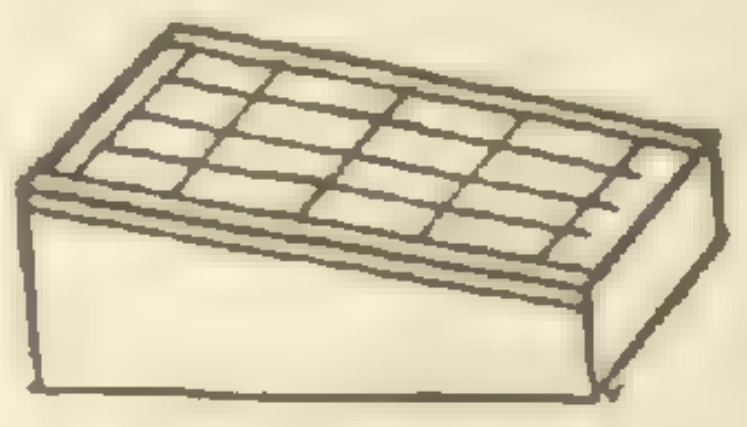
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to.	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.



Size	Price
4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

Apply for List to—

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

SURE-BEARING APPLES.

As we have so frequently pointed out in these pages, there are many thousands of acres of excellent land in the United Kingdom that are occupied by fruit trees which, from some well-known cause, or a combination of causes, do not yield sufficient fruit annually to pay for the rent of the ground. In innumerable instances the unprofitableness of the orchards and fruit plantations is due to the exhaustion of the trees from old age or indifferent management, and in others it is the result of planting varieties that cannot be depended upon to produce crops excepting in seasons specially favourable to the apple. These facts were brought into special prominence in the long, elaborate, and costly investigation of English orchards we made a few years since with such satisfactory results, and as they were fully set forth by our special commissioner in his series of reports, under the title of "The Wasted Orchards of England," it is not now necessary to refer to them further than to say that an enormous sum of money is lost to the country through so large an area annually being planted with varieties of the apple that bear crops in those seasons only when apples are exceptionally abundant. It is not possible to give an exact estimate of the annual loss from this cause, but it must amount to some hundreds of thousands of pounds sterling, and the loss of such a large sum is specially regrettable from the fact that it might be materially reduced within a few years were owners of orchards to take advantage of the information that is given them. The question of substituting sure-bearing for uncertain varieties is not less important to the private cultivator than to the grower for market, and we are pleased to say that much is being done in private gardens to improve matters by replanting and regrafting. Recognizing the importance of evidence that will not admit of question, we asked a large number of the leading fruit growers to send us the names of apples that have this year, which has been remarkable for the lightness of the apple crop, borne satisfactorily. Our request received a ready response, and the reports which have been received and published contain information of the most valuable character. As will have been seen from a perusal of the reports, the number of sure-bearing varieties is very small in proportion to the number of apples that have a place in trade lists, but it is more than sufficient for the purpose of maintaining a liberal supply during the seven or eight months in which apples may be had in perfection. We have prepared an audit of the varieties enumerated in the reports, and the twenty-four standing highest in the audit of cooking apples are: Bismarck Blenheim Pippin, Bramley's Seedling, Cox's Pomona, Dumelow's Seedling, Ecklinville Seedling, Gascoyne's Scarlet, Golden Spire, Golden Noble, Keswick Codlin, Lane's Prince Albert, Lord Grosvenor, Lord Suffield, Manks Codlin, Mère de Ménage, New Hawthornden, Newton Wonder, Northern Greening, Stirling Castle, Loddington or Stones, Tower of Glamis, Warner's King, Wealthy, and Yorkshire Beauty. The twelve dessert apples that are mentioned as bearing the heaviest crops, by the largest number of correspondents, are: Allen's Everlasting, Cox's Orange Pippin, Court Pendu Plât, Duchess of Oldenburg, Fearn's Pippin, Irish Peach, King of the Pippins, Lady Sudeley, Red Astrachan, Ribston Pippin, and Worcester Pearmain. There are, of course, many excellent cooking and dessert apples other than those enumerated above, and cultivators may be advised when they find an apple of good quality that bears abundantly in their district year after year to plant it in accordance with their requirements. But as the varieties named are of good quality and sure-bearing in all parts of the country, they should in all cases be selected, as profitable fruit plantation can only be obtained by the planting of sure-bearing varieties.

FRUIT AND VEGETABLE IMPORTS.

The Board of Trade returns for September are even more satisfactory than were those for August, there being a material augmentation in both the imports and exports. The exports, which in the case of an old country are regarded as the best indication of activity in commercial circles, show an increase of £1,639,810, equal to 8·9 per cent. As is customary, the products of the garden and the farm constitute an important part of the imports, and in glancing at the figures it is difficult to understand why our dependence upon foreign and colonial produce cannot be materially lessened. Of apples we imported 248,126 bushels, of the value of £74,651, and the absorption of this large quantity at remunerative rates is sufficient to refute the views of those who a few years since were so loud in proclaiming that an extension of fruit culture would be disastrous, inasmuch as there would be no outlet for the produce. During the nine months ending September 30, our imports of apples amounted to 1,310,553 bushels, of the value of £460,066. There was a material increase in the imports of grapes, those for September amounting to 274,835 bushels, of the value of £126,173, which is the largest sum we have paid for these fruits in September for several years past. With reference to the imports of pears, it must be said that there was a drop in quantity of 142,511 bushels, and in value of £37,173; the quantity received during the month being 169,064 bushels, of the value of £70,501. There was a material decrease also in the quantity of plums received; but the imports of these fruits were more than sufficient to prevent the price of home-grown fruit rising to a point that placed it beyond the means of the masses. Unenumerated fruits continue to be received in increased quantities, the imports amounting to 328,793 bushels, against 251,154 and 157,224 bushels respectively in the corresponding month of the two preceding years. There has been a similar increase in the imports of the first nine months of these three years, and it is of interest to observe that the value of the imports for the nine months ending with September last closely approached three-quarters of a million sterling. It is satisfactory to have evidence in the returns that the consumers were less dependent during the past month upon foreign growers for their supplies of potatos than was the case last year. Last month the imports amounted to 77,271 cwt., of the value of £14,078, against 91,895 cwt., of the value of £17,078, in the corresponding month of 1897. For the year the imports of potatos will be heavy, as during the nine months under review we imported nearly 6,500,000 cwt., against about 2,250,000 cwt. in the two previous years. As regards values, we have paid this year nearly £1,000,000 more for our supplies of potatos than in 1896 and 1897. Onions show a drop both in quantity and value for September; the quantity received having been 664,376 bushels, of the value of £72,486, as compared with 755,499 bushels, of which the value is given as £82,860; truly a large sum to pay for a month's supply of onions, which nowhere can be grown to a higher degree of perfection than in this country, as witness the magnificent examples shown at the two meetings held at Westminster during the past week.

The Orchid Houses at Kew, at least those to which the public were admitted, have been rebuilt of late, and, as previously noted in our columns, four houses take the place of the original two. These are lower-roofed than the old ones, and are thus better adapted to plant cultivation, while the visitor can the better examine and study the specimens. The effect of the plants as now arranged is scarcely so striking as formerly, but the provision of four small houses allows of as many variations of temperature, whereas before the new order of things the orchids had perforce to put up with either hot or cool conditions. The private department attached to the T-Range has also undergone considerable alteration and expansion, so that there now seems to be sufficient space for our extensive and comprehensive national collection of these most interesting plants. For many years past the orchids have suffered from overcrowding, for the number of plants and species has increased, while the space at disposal remained the same. The private orchid houses are all connected with those open to the public by a closed and covered way, an improvement likely to be appreciated by those in charge quite as much as by the plants. One misses the porch-like house at the outer end of the orchid houses wherein the insectivorous plants were grown, and its absence is rather a disadvantage, for now one has to pass out of doors from one pair of houses to the other, instead of making the tour of all the orchid and other houses in the range without going out of doors.

The Drought in East Kent.—Mr. E. Hollman, Bramhope, Canterbury, writes: Seldom has rain been needed here more than previous to the recent rains, for with so little for the past three months the need for it became seriously apparent. In this district many trees and shrubs show only too plainly how much they require moisture, many deciduous kinds shedding their leaves prematurely, and will take some time to recover. Never have I seen the stems of Jerusalem artichokes with so many flower buds, the result of the hot, dry weather. When visiting a neighbouring garden lately I noticed that the celery crop was almost a failure, and was informed that although it had been well attended to by frequent waterings, &c., the plants had refused to grow, and would not pay for earthing up. The garden has a light subsoil. Caterpillars have done much damage in many places, almost stripping cauliflowers, sprouts, &c. The frosts of September 27 and 29, which cut marrows, dahlias, &c., remind us that the time for planting fruit trees, &c., is close at hand, and how much we need rain for this most important work, for, although we may water, who can do this part of the work like Nature?

Sir Edwin and Lady Saunders celebrated their golden wedding at Fairlawn, Wimbledon Common, on Wednesday, the 12th inst. Both Sir Edwin and Lady Saunders were the recipients of many "golden" tokens of affection and esteem from friends at home and abroad, and among the two hundred guests who gathered to congratulate the genial President of the National Chrysanthemum Society and his amiable lady were such distinguished personages as Sir Samuel Wilks, President of the Royal College of Physicians; Sir William MacCormac, President of the Royal College of Surgeons, and Lady MacCormac; the President of the Royal Medical and Chirurgical Society, the President of the Odontological Society; Sir William White, Constructor to the Royal Navy, and Lady White, Sir William and Miss Roberts, Sir Henry Thompson, Sir William H. Broadbent, Lady Russell Reynolds, Lady and Miss White Cooper, &c. As our readers are well aware, Sir Edwin has been a generous patron of horticulture; he has been a Vice-President of the Wimbledon and District Royal Horticultural Society almost from its institution. He became a Fellow of the Royal Botanic Society in 1853, being elected to a seat on the Council, while as a Fellow and President of the Royal National Chrysanthemum Society he has furthered its interests by his presence and generous support. In Mr. A. Newell, who has been in his service for nearly twenty years, Sir Edwin Saunders has a most enthusiastic gardener, who is justly proud of the cups and medals won at Wimbledon, the Royal Aquarium, and elsewhere. Sir Edwin was born in 1814, and for his services to the dental profession was knighted in 1883. For many years he was Dental Surgeon to the Queen, and on the occasion of his golden wedding Her Majesty honoured him with a letter of congratulation. We hope the veteran knight may long be spared to support the art and science of horticulture.

The Grapes at Chiswick are very fine this season both as regards size of berry, quality, and general finish, and this fact seems to be generally recognised by Fellows of the Royal Horticultural Society, for, Mr. S. T. Wright informs us, orders are plentiful, and it is not likely that many bunches will spoil. The collection of varieties of grapes at Chiswick is extensive, and at the present time there are a number to select from. In the big vinery the following are ripe: Black Hamburgh, Black Alicante, Lady Downes, Royal Muscadine, Buckland Sweetwater, Raisin de Calabra, Dutch Hamburgh (poor quality), Gros Colmar, Golden Hamburgh, Black Prince, Black Monukka, and Muscat of Alexandria, with Gros Guillaume to follow soon. In the long vinery Gros Maroc is just ripe. In one of the small curvilinear vineries such interesting varieties as San Antonio, Muscat of Hungary, Royal Ascot, and Golden Queen are ripe, while in the muscat house there still remain splendid examples of Muscat of Alexandria, fair sized, but large berried bunches; Canon Hall Muscat and Bowood Muscat, Foster's Seedling, almost all gone; Mrs. Pearson, Madresfield Court, finished by the time this appears; Mrs. Pince and Dodralabe, the latter a poor form of Gros Colmar, and evidently left in the muscat house as a kind of "shocking example." There are many subjects of interest at Chiswick, but the apples and pears in the fruit room and the hanging bunches of grapes in the various vineries are the chief, and these are such as to prove that the gardens are not quite so played out as some would have us suppose.

"Orchid Culture" is the title of a small treatise issued by the Leeds Orchid Company, in which the several details that must have attention are dealt with. These details include the temperature, heating, ventilation, and shading of orchid houses, and the potting, watering, and resting of the plants. The several diseases to which orchids are subject are also referred to.

Effect of Drought upon Floral Colours.—The Rev. W. Wilks has made the following observations on the colouration of flowers of the present season: All through the exceptionally hot weather of the end of July and August all scarlet flowers had a tinge of dull brown in them, pink had a shade of orange, yellow was very yellow, white was creamy. This was very marked—*e.g.*, in dahlias. Thus Fire King and Sunset, two ordinary bright clear scarlet flowers, had a distinct dull brown tint overlying and spoiling utterly the usual scarlet, so much so that, having been away from home the first three weeks of the heat, I thought on my return the dahlias must have somehow got wrongly named. But now the weather is cooler the bright scarlet has come back, and the dull browny tint has gone, and all is as usual. The only colour the heat seemed (to me) to suit was the salmons, and they have been very fine and intense, having a sort of glow added to them.

The Potato Disease, in spite of the long-continued dry weather, has not been so completely checked as was generally expected. The late crops in Cornwall, Cumberland, Devon, Lancashire, Lincoln, Kent, Stafford, Norfolk, Nottingham, Yorkshire, and Monmouth have in very many instances been affected. In Lanark and Roxburgh the pest has been found, and also in the Welsh counties of Anglesey, Glamorgan, Merioneth, and Pembroke. We are also informed that the early crops, properly ripened and stored, are sprouting fast, so that they will be difficult to keep well unless cold weather sets in.

The English Cut Flower Trade.—At the conclusion of a most interesting article on Flower Farming in England, contributed to the Journal of the Royal Agricultural Society, Mr. W. E. Bear says there is no doubt that flower-growing is greatly extending in this country, and that competition among home growers is becoming more and more severe. Foreign supplies of flowers have increased, but not nearly as greatly in proportion as home supplies, and it seems clear that home growers have gained ground in relation to their foreign rivals, except with respect to flowers for the growth of which foreigners have extraordinary natural advantages. There is a danger of the culture of the narcissus being too much expanded; also that the chrysanthemum is produced in excess of the demand. Again, in the production of violets, the warm and sunny south of France has an advantage not possessed by this country, while Holland maintains her hold upon the hyacinth and tulip trade for a similar reason. But whether the production of flowers as a whole is gaining ground upon the consumption or not it is difficult to determine. Mr. George Monro, of Covent Garden, who is certainly one of the best authorities, is of opinion that supplies of cut flowers are "pretty nearly overdone," as indicated by the great glut that occurred in the summer of 1897. Prices, he says, are much lower than they used to be, and only the best growers do well. Thus in flower-growing, as in nearly every other career, inquiry leads to the conclusion that "there is plenty of room at the top." In this industry, moreover, there is such a very wide scope for the exercise of superior skill, industry, and alertness, that it is not surprising to find some who are engaged in it doing remarkably well to all appearance, while others are struggling on and hardly paying their way. To the casual looker-on, who knows nothing of the drudgery of the industry, flower-growing seems a delightful method of getting a living. That it is an entrancing pursuit there is no doubt; but it is equally true that it is a very arduous one, requiring the most careful forethought, ceaseless attention, and abundant energy.

New Park for Lee and Blackheath.—The Parks and Open Spaces Committee of the London County Council have informed the Lee Board of Works that they will recommend the Council to provide one-half of the purchase price for the Manor House Estate, so that the latter shall become a public recreation ground. The owners—Lord Northbrook and Lord Baring—have fixed the price at £9,600 for the nine acres. Lord Northbrook has, however, offered to give £1,300 towards laying out the estate. We understand that the Parks Committee propose to acquire ger's House and part of the surrounding land as public property,

Experimental Horticulture is a subject of more than passing interest to gardeners in these days, when it is absolutely necessary that large crops, and of the highest quality, be raised on the smallest possible area and at the minimum of cost. An opportunity of discussing the best ways and means of conducting experiments likely to be of lasting value to horticulturists will be afforded at the Drill Hall, Westminster, on Tuesday, October 25, when Mr. George Gordon, V.M.H., will give a lecture upon Experimental Horticulture before the Royal Horticultural Society, at three p.m.

The Flora of Puerto Rico.—We are informed that Mr. Cornelius Vanderbilt will bear the expense of an expedition to start in November to study the flora of Puerto Rico. Mr. A. A. Heller, an experienced collector, will conduct the expedition, which was planned by Dr. Nathaniel Lord Britton, one of the authors of "The Illustrated Flora of the Northern United States."

National Chrysanthemum Society.—The members of the sub-committee appointed in the spring for the purpose of making investigations and reporting upon the place most suitable for holding the exhibitions of the society, having completed their labours, submitted their report to the General Committee at a meeting held on Monday evening. As this gathering, in common with other meetings of committees, was private, we cannot with propriety give a full report of the proceedings; but, in view of the great interest evinced by the members of the society with regard to the place of holding the exhibitions, we give the following facts. The meeting was held at the usual place, and there was a large muster of members of committee and delegates from affiliated societies. The report was lengthy, and gave in considerable detail the investigations that had been made, and the conclusions arrived at with regard to the suitability or otherwise of the several places visited. Abundant proof was afforded by the report that the members of the sub-committee had fully appreciated their responsibilities, and had performed their duties with a thoroughness deserving of much praise. Some of the buildings in London that had been regarded as likely to prove suitable were found, on enquiry, not available in 1899, in consequence of their being already engaged; while none of the other buildings visited were recommended. The sub-committee also interviewed the Crystal Palace and the Royal Aquarium authorities, and, as a result, a recommendation was made to the General Committee that arrangements be made with the Crystal Palace Company for holding the exhibitions at Sydenham. The report was fully discussed, as indicated by the fact that its consideration extended over two hours, and the discussion was throughout brisk, and in excellent spirit. The chief objection urged against the Crystal Palace as the future home of the National Chrysanthemum Society was its distance from the centre of London, and the principal arguments in favour of continuing the shows at the Royal Aquarium were the central position of the building and the remarkable development of the society since it had held its exhibitions at Westminster. On the motion for the adoption of the report being put, the votes were in exact proportion of two to one against the proposals of the sub-committee. The consideration of the arrangements for next year was deferred until the meeting of the General Committee, to be held on Monday next, and a hearty vote of thanks was accorded the members of the sub-committee.

Supposed Hybrid between Dahlia and Helianthus.—Mr. Lowe, of Shirenewton Hall, forwarded blossoms to the R.H.S. Scientific Committee which had a true dahlia appearance, but which he believed to be raised from seeds of a parent the issue of the above cross. Nothing, however, excepting a rather large disc appeared to indicate a cross. The relationship between a dahlia and a helianthus being relatively remote, any *à priori* probability of such a cross being effected is but slight. In experimenting it would be extremely difficult to prevent self-fertilisation, unless it be proved that the pollen is self-impotent in dahlias.

Horticultural Club.—The first dinner and conversazione for the session 1898 and 1899 took place on Tuesday, 11th inst. The chair was occupied by Mr. Philip Crowley, and there were also present: Messrs. Geo. Monro, James H. Veitch, Peter Kay, William Bassett, James Walker, Peter Veitch, J. Assbee, C. Mason, and the Secretary. A paper of Mr. George Bunyard's was read, who, owing to indisposition, was himself unable to attend. The subject of it was "The Fruit Crop of 1898, and its Lessons." It was very ably treated, and led to a very interesting discussion, in which most of those present took a part.

Two New Cactus Dahlias, of considerable merit, have been sent us by Mr. J. T. West, of Brentwood, a successful raiser and grower of these popular autumn flowers. One variety is bright golden yellow and named Mrs. J. J. Crowe; the other is a handsome crimson-scarlet form named Mrs. Carter Page. Both these dahlias are of the best type, having curved, spiky, and pointed florets. Mr. West states that the dry weather has prevented him exhibiting these varieties at dahlia shows during the autumn, and under favourable conditions the flowers would probably have been larger. We hope the flowers will not be of larger size in better seasons, and we also trust that Mr West will give us many more good new dahlias provided beauty and good form, rather than large size, continue to be his aim in their production.

An International Horticultural Exhibition will be held at Antwerp in April, 1899, from the 9th to the 13th days inclusive. This exhibition is to celebrate the three hundredth anniversary of the birth of Antoine van Dyck; it is to be held in the Palais des Fêtes of the Royal Zoological Society, and is organised by the Royal Horticultural and Agricultural Society of Antwerp, with the patronage and assistance of the Government, and of the province and city of Antwerp. The schedule before us provides for one hundred and eighty-two classes; there are five for newly-introduced plants, and eight for new hybrids; orchid growers have the run of fifteen classes, and the prizes include a work of art presented by Baron Ozy de Zegwaart for the most artistic group of orchids, eleven gold medals, and a number of silver and silver-gilt medals. The Queen o Belgium offers a gold medal for the best twenty-five specimen flowering plants, while gold medals are freely offered by the society and the leading Belgian horticulturists for anthuriums, liliums, hyacinths, tulips, amaryllis, roses in pots, azaleas (eleven classes and nine gold medals), rhododendrons, New Holland plants, &c. His Majesty the King of the Belgians offers a gold medal for the best collection of fifteen ornamental foliage plants, distinct species or varieties. Palms and ferns are amply provided for; so are dracænas, crotons, nepenthes, bromeliads, succulents, and conifers. A number of classes are provided for florists' arrangements, and the prizes will be awarded with a view to encouraging originality in design and treatment. Intending exhibitors should communicate with M. Anatole de Cock, 215, Chausée de Malines, Antwerp, and entries must be made not later than March 10, 1899. Baron Ozy de Zegwaart is president of the Council of Administration, while MM. Jean Everaerts and Alphonse de Cock are vice-presidents; M. H. Vanderlinden is treasurer, and MM. C. Vanderlinden and Anatole de Cock are the secretaries; M. Chas. de Bosschere officiates as librarian editor. On the council are such well-known gentlemen as MM. Charles van Geert, Florent Pauwels, Alberic Lunden, Baron von Ohlendorff, Arthur Morren, &c.

The "Botanical Magazine" for the present month contains illustrations of Cyrtosperma senegalense, a curious West African aroid; Cytisus purgans, a handsome, golden-flowered, and dwarf broom; Amelanchier canadensis var. oblongifolia, a geographical form of the June berry; Feijoa Sellowiana, a Brazilian shrub with blood-red flowers and large guava-like fruits; and Rhododendron rubiginosum, a pretty rose-coloured species found in Yunnan by the Abbé Delavay.

What is an Amateur?—This question will come before the County Court at Hastings on Monday next. Some prizes awarded in the amateurs' classes at the November exhibition of the National Chrysanthemum Society were withheld by the General Committee on the ground of the exhibitor not being a *bona fide* amateur, and he has entered a plaint for their recovery. The hearing of the case is fixed for eleven o'clock.

Weather Forecasting.—At the recent meeting of the British Association at Bristol, it was proposed by Mr. Douglas Archibald that, in addition to the present daily forecast of changing weather conditions in these islands, a supplementary forecast should be given of the probable general character of the weather for half a week or more. The utility of such an extension, if practicable, of our present system is obvious, especially to the agriculturist. Our present twenty-four-hour forecasts, designed, as they were, chiefly to warn us of the approach of dangerous storms, are mainly serviceable to the mariner and fisherman. To the farmer and agriculturist they are of little value. A single day to him is of small account. What he would like to know is, How long is this weather likely to last? What will it be next week or next month? What sort of a season is it going to be—dry, hot, cold, rainy, cloudy, or that mixture of all the types which is so trying to the temper, but at the same time so conducive to the preservation of that national vigour of mind and body which has given England a leading position among the nations? If at present we dare not proclaim the possibility of eventually predicting the general character of an entire season, it is not because there is any scientific prohibition, but rather because, having started at the wrong end, viz., the particular, we must advance cautiously towards the general. Half a-loaf, however, is better than none at all. Half a-week's forecast ought to be of some service to the agriculturist, especially if it is framed in language suitable to his particular needs. The basis for this new departure in weather prediction lies in the growth and recent development of the knowledge of specific weather types prevailing over large areas.

Fungus on Pear Foliage.—Some diseased pear leaves sent to a recent meeting of the R.H.S. Scientific Committee were submitted for investigation to Mr. Worthington G. Smith, who has reported as follows:—The pear leaves with rusty spots are attacked by a Roestelia, one of the group of Uredineæ. This fungus is one which completes its life history on two host-plants. The leaves submitted are those of one host—the pear. They bear two distinct kinds of rusty spots or areas, viz., smooth areas in which the leaf tissue is almost normal, and swollen areas with the leaf tissue abnormally increased and full of starch. The smooth spots are studded on the upper surface with black points, the pycnidia or spermatia; as a rule these were covered with a hardened film of what had been sticky masses of ejected conidia, generally blackened with smut or bearing saprophytic fungi. The swollen pustular areas also bore spermatia on the upper surface, and also partially developed æcidium cups embedded in the abnormally increased tissues of the lower half of the leaf. The imperfect development of these æcidia prevents me identifying the species of Roestelia exactly; it is probably R. cancellata. This fungus may also attack the fruit. The second host of the "rust" is given as the Savin (*Juniperus sabina*), and it would be useful to know if this or an allied Juniperus occurs in this garden, also if they were perfectly healthy. The rust is a common source of trouble, especially a form which occurs on apple trees. The latter is very injurious in the United States. American authorities advise removal of the second host, the juniper, also destruction of badly diseased trees or branches. After these precautions are carried out Bordeaux mixture is said to give good results. It is used in two or three sprayings at intervals of eight to ten days, the first given as soon as the young foliage appears. It is also strongly urged to use varieties of apples or pears suited to resist the rust. These, of course, vary for different soils, and must be found out after making the necessary experiments in the locality where wanted.

Gas.—Dr. Calmette, in the "Le Nord Horticole," points out that manure evolves large quantities of carburetted hydrogen gas which is inflammable, and makes the absurd proposal that farmers should make use of it to light their farms. The manure, he says, should be covered by a bell-shaped receiver to collect the gas and lead it to a second receiver, where it can be washed and stored.

A BOTANICAL TOUR IN PERAK.

MR. C. CURTIS, F.L.S., Assistant Superintendent of Forests at Penang, and chief of the Penang Botanic Gardens, has recently been on a short botanical tour in Perak. The following are a few brief notes anent the tour :—

I arrived at Teluk Anson at eight a.m. (July 30) and found myself just five minutes too late for the train to Ipoh. As the next suitable train did not leave until 2.25, I drove out with Mr. L. Hawkins to see the coffee and rubber plantation under his charge. The coffee looked well, although there had been an unusually long drought at the time of my visit. Given suitable soil, the success of this cultivation in Perak is assured, but the present low price must be a great disappointment to those who invested heavily two or three years ago.

Rubber Trees.

The Para Rubber, with which a commencement had been made, and for which the soil appeared to be adapted, looked well, but a new enemy, supposed to be mouse deer, has taken a fancy to this tree and eats the tops off. All the plants so eaten sprout again, still the check is considerable, and, if constantly repeated, must eventually kill them. This is a factor that has not hitherto been taken into account in connection with the tree, and shows that it will be necessary to keep the *lalang* and jungle growth clear, so that there be no harbour for these animals until the tops of the trees are high enough to be out of their reach, or else to fence in the area to be planted.

At Ipoh, I took up my residence in the Rest House, and the following morning started out to explore the neighbouring limestone or marble hills. Quite close to the railway, a Singapore company have commenced quarrying marble, and three Italians, I was told, have been recently imported from Europe for this work. Many interesting plants were collected during the morning, but the most interesting thing to me was the finding of several trees of Gutta Rambong (*Ficus elastica*) in a truly wild state. Everyone interested in the subject knows that Gutta Rambong is collected by Sahkis and brought in for sale, and the tree has long been recorded in botanical books as a native of Perak, but, curiously enough, neither Mr. Ridley nor myself had ever collected this tree in the Peninsula. All that I had seen hitherto had undoubtedly been planted, but these trees were growing high up on the rocks and had sent their aërial roots down the face of the cliffs. Every tree I saw had been tapped, and in some cases tapped to death. I obtained leaf specimens only, as none of the trees were in fruit. Another interesting plant from a botanical point of view, very abundant here, is Lowia, a genus named after Sir Hugh Low, a former resident of Perak and a keen botanist. Gardening is not greatly to the fore in Ipoh. Shade trees are badly wanted all over the place, for walking or driving on those intensely white and hot roads during the heat of the day is killing. A half-hearted attempt at planting has been made in places, but the fencing has not been sufficient to protect the trees from the ravages of goats, &c.

The European residences at Batu Gajah are beautifully situated, commanding a fine view of the surrounding country. In the hospital grounds I noticed the largest tree of Jacaranda mimosiæfolia I have yet seen. No doubt it is the same age as the oldest of those planted in Penang, but it is much larger than any here. All the trees of the kind, in this part of the world, are, I believe, from seeds or plants distributed from the Penang Gardens, and the oldest cannot be more than twelve years planted. There is also in the same grounds a fine clump of palms and a Kayu Rue (*Casuarina*), that looks somewhat different from typical Casuarina coquisetifolia, of which I obtained seeds.

At Sungei Siput, I called first to see Mr. Forrest, who is superintending the opening-out of land for coffee, cocoanuts, &c., not far from the station. However, he had gone out, and the boy said he would not be back until the evening, so I retraced my steps through the village and proceeded along the Kuala Kangsar Road so far as Kamuning Estate, though I did not at the time know what estate it was. This seemed to be a favourable place for collecting, so I worked around the edge of the clearing, collecting living plants for cultivation and specimens for the herbarium, until it was time to return to Sungei Siput to catch the train for Ipoh. The coffee on this estate is the finest I have yet seen. Para Rubber planted alongside the road through the estate does not appear to grow so well as it does in damper soil. On August 3 I went out to some hills about three miles from Ipoh, on the GopengRoad, to the only habitat I know of Habenaria Kingi, an interesting orchid with greenish flowers. Of this I succeeded in getting some thirty plants, and a few other things of interest. It is a difficult spot to work, as all the rocks are surrounded by swamp. Since I last went along this road a good deal of coffee has been planted, and other smaller cultivations have increased considerably. Before going out in the morning I visited Mr. Barnard, who kindly presented two or three interesting plants for the Gardens. At half-past five the next morning I left Ipoh for Melimbau, a village near the foot of Gunong Kledang. In a 'rikisha it took half-an-hour to reach, so that I was able to start collecting up the hill while it was still cool. There is a good road up the Kledang, with a Goverment bungalow near the top. The distance from the foot is four miles and a-half. Going slowly and dipping into the jungle here and there, it was near noon when I got to the top. The lower slopes of this hill have been cleared of all big trees for firewood or charcoal, and I noticed several wood-cutters at work. About half-way up there occurs, and more or less from there to near the top, a magnificent palm with a stem six or seven feet high and immense paddle-shaped leaves, which the Malays call "Daun Sang." I spent a lot of time in hunting for seeds of this, but without success. We dug up a few young plants, but palms are always difficult to transplant, and I do not expect to save more than one or two. Daun Sang occurs, I am told, all through this range. I saw some leaves used for the side of a native house at Sungei Siput, and if anyone in the locality can send ripe seeds it will be a most acceptable contribution to the Penang Gardens. Near the top there grows a very pretty Indian Primrose (*Didymocarpus*), with orange flowers, quite new to me and, I believe, undescribed. Palms of many kinds are a marked feature of the vegetation on this hill, rotans and bertam being very abundant. The day following I packed all plants collected during the previous five days and forwarded them to Penang, and on the next day left for Kuala Dipang. Kuala Dipang is not the pleasant place it once was. This, the most charmingly situated of rest-houses, has been turned into a police-station. There are, however, two rooms used by Government officers when on duty, one of which I occupied for two nights before going up Bujong Malacca. It is a pity that this house should be occupied by the police, for Government officers, unless they are more fortunate or sounder sleepers than myself, cannot get much rest when in this place.

Gunong Bujong Malacca.

On Monday, at eight a.m., I left Kuala Dipang with four Malays engaged on the spot, and my own man and boy from Penang, to ascend Gunong Bujong Malacca. The Malays were a very poor sample, but as my time was limited I took the first that offered. We went on climbing slowly until about eleven a.m., when we came to a Chinese kongsi-house at a place called Kadongdong. Here the men decided it was time to stop and cook their rice, and as the spot looked like a promising collecting-ground, I raised no objection, but poked about among boulders for an hour while they got *makan*. Their style of hill-climbing suited me all right, but would have been a frightful nuisance to anyone whose object was simply to reach the top. After leaving this kongsi-house, in which there are five men, we found, at only a few minutes' walk distant, two ways up to Ulu Palas, the one to the left being longer but not so steep. This we decided to take in going up, and to return by the other. I was very pleased afterwards that the men told me of this longer route, as it proved more interesting botanically than the other. At about half-past three (watch stopped) we arrived at another kongsi-house in a large valley which the Chinese call "Amokong," and the Malays "Ulu Palas." The Palm "Palas" (*Licuala spinosa*), from which the stream takes its name, is very abundant along all the ridges of the mountain. In this mining kongsi-house, in which are six men, but there had apparently at one time been many more, we decided to spend the night, and go to the top in the morning.

After a brief rest I started out to examine and collect plants in the neighbourhood, but the Malays were all asleep inside of ten minutes, and, as they were at the other end of the house, I saw nothing more of them until the next morning. Washing for tin has been going on in these streams for years, and it is a bit difficult at this point to make out just exactly where the original water-courses came in, but so far as I could see there are at least three different streams which join at this spot. Grubbing for tin has capsized trees in all directions, so that it is easy to get to examine the orchids and various other plants growing on them. There had been no rain for some time previous to my visit, and many of the smaller things, such as filmy ferns, on both rocks and trees, were quite shrivelled up. Many larger plants of a succulent nature were hanging limp and languishing for rain. They got it before I left.

During the night I thought the matter over and came to the conclusion that if I took my bedding, provisions, &c., to the top, and slept there, it would take the kind of men I had a long time to get up, and I should get but few plants carried down. Consequently, I decided to leave my boy with all the things at the kongsi-house, take all the men out with me to carry plants, and return at night. From this point none of the men knew the path to the top, but they knew that, higher up the stream, there was one more kongsi, where, if we could find it, some information could be obtained. So we kept to the stream until we struck it. Here some of the men spoke Malay, and one came with us to show the path until a point was reached, after which there could be no mistake.

There is a pretty stiff bit before getting on to the last ridge, but the whole distance from Kuala Dipang to the top could be done in a day by one in pretty good training, and desirous of doing the thing quickly. The height, I was told, is 4,090 feet, but, judging from the vegetation, I should have thought it more. The hut on the top is in excellent order, and water is obtainable at a much less distance from the top than I expected. We remained on the top for about an hour, admiring the view and refreshing the inner man, after which we commenced to retrace our steps and collect things spotted on the way up. Up to this time, I had not seen a drop of rain since leaving Penang, but during the night it came on heavily, and as the kongsi-house leaked like a sieve, things were a bit uncomfortable. On the way down we got another thorough soaking, so that by this time the vegetation will be looking much better than when I was up there. Altogether, it is a most interesting mountain. On the top there are a great number of the fir tree that grows on Government Hill, "Kayu Rue Bukit" (*Dacrydium elatum*), but they are smaller and more stunted. Most of the orchids have rather insignificant or dull-coloured flowers, but they are very abundant. Some of the ground orchids are of great interest. Two kinds of rhododendrons, a pitcher plant, and scores of other things of great interest, were noticed and collected. All the way up palms abound, but the animals—monkeys, I think—manage to get all the seeds before they are quite ripe. On the rocks are an abundance of ferns, begonias, Indian primroses, and other small-growing plants in great variety. Having a day to spare after coming down, I tried Bujong Malacca again from the Kuala Dipang valley side. It is much steeper than the usual path to the top, and I did not find anything strikingly different from what I had already collected the previous day.

The next morning I went out to some rocks near Kuala Dipang, to get a begonia and one or two other things noted previously, and later in the day went on to Kampar, where I remained the night in the Rest House.

Roses.—Whence should the amateur, who seeks to recall the fragrance of the past, stock his garden with the white moss rose, the clustered blush rose, the plain, old-fashioned damask rose, or the single, striped York and Lancaster? How, too, should he revive the faintly remembered glories of that rich corner of the garden in the old home, where year after year the same, venerable, lichen-frosted rose trees, scrambling over moss-grown walls, dropped their showers of petals over the marjorum and gillie flower, the sweet basil and true-love-lies-bleeding beneath? It would be a worthy effort, observes a writer in the *Globe*, of some of the democratic authorities whom modern views have placed in charge of parks and public places, to reproduce in some corner of each the flower garden as it used to be when our grandfathers courted our grandmothers there. Thus, the nation might retain in fact, as well as fragrant memory, many of the floral favourites that bloom in Shakespeare's verse. Some are gone beyond recall; but some still linger by accident in the gardens of old estates, which have not yet passed into the hands of manufacturing millionaires. But the task is beyond the strength of the amateur rose-grower of limited means, who courts more complete disappointment in attempting to revive the past than he does even in trying to keep pace with the breathless present. So he generally collapses into comfortable mediocrity, and orders his roses by the dozen of "good, mixed sorts" from the nearest nurseryman. Then, when a guest askes him the name of one of his roses, he can say, "Oh, that is a La France, or a Jeremy Diddler, or something," and everyone is satisfied. But the name or fashion of a rose matters little, after all—a sentiment which Shakespeare has, by the way, anticipated. It is still a rose, the sweetest and queenliest of flowers; and there is no period of man's life over which the rose does not exercise its sway. Childhood, which puts everything that its hands can grasp into its mouth, rejoices to find that the rose, unlike the geranium, is quite palatable; while the succulent shoots of the rose bush may be chewed with relish. The boy promoted to knickerbockers admits cheerfully that the rose has a "jolly smell," and is always ready to follow the example of Yorkists and Lancastrians and wear it as a badge. Indeed, in the vicinity of some large schools, where the red and the white rose typify the classical and mathematical sides, the demand for roses of pronounced hue on great school occasions severely taxes the local supply. Passing from boyhood, the youth still recognises the rose's symbolic power; and, whether he wears it in his own buttonhole or presents it, with a frond of maidenhair, to the only girl he has ever truly adored, it is the recognized badge and livery of all-conquering love. To middle age, the rose expresses the fulness of virtuous beauty, the fragrance, as it were, of a well-spent life, and the richness of complete content.

CHRYSANTHEMUMS.

DEVELOPMENT OF THE FLOWERS.

THE abominable fungus which has recently infested, more or less, almost every collection of chrysanthemums, comes as an additional worry to those in particular who grow specimen blooms for exhibition. Its marvellous rate of increase and the apparent ease with which it is distributed amongst the plants are very discouraging facts, and we must meet the trouble in a very determined manner if we are to escape its far-reaching and serious consequences. The initiative taken by Mr. Sanders and Mr. Waterer in suggesting a conference on the subject, to be held at the October exhibition under the auspices of the N.C.S., is deserving of high praise, and let us hope that the outcome may be some readier means of combating the disease than has at present been discovered. Meantime we must pick off and burn every spot which can be found, and spray the foliage with sulphide of potassium, already recommended in the GARDENERS' MAGAZINE, whenever the weather permits such treatment, at intervals of a few days. Everything depends on individual effort in the stamping out of such a disease, and nurserymen especially ought to be alive to this fact, and take especial pains to avoid distributing infected cuttings or plants, otherwise chrysanthemum growing may receive a serious check.

Complaints reach me from all parts of the South of England of the loss of buds through their dying off when about as large as hazel nuts, and though this applies to several varieties more or less, the worst affected are Madame Carnot and its sports. There is little doubt that this is caused by the hot sun and altogether exceptional weather experienced since the buds were taken, and the reason Madame Carnot has suffered most is that its extremely succulent nature has presented too much sap to the buds, which, under the influence of abnormal heat, has resulted in decay. Many of our own plants of the Carnot section were housed early and shaded from bright sun, after which no loss occurred. Simplicity, Duke of York, Lady Byron, and buds of others "taken" early in August are those which have suffered most. With such a gloomy opening to my contribution it might appear to some that there is nothing but trouble in store for those who cultivate chrysanthemums. The advent of the flowering season, however, has brought with it plenty of bright prospects to those who have carefully attended their plants, and we may offer a few hints at this time on the development of the blooms.

By the time these notes appear, cooler, and we may hope for many reasons, more rainy weather will be with us; ventilation will need more care, and fireheat be necessary when the outside temperature approaches the freezing point. The pipes must also be warmed when rainy weather or fogs prevail. The aim will be to maintain a buoyant atmosphere ranging from 45 to 53 deg. Always give a little top ventilation night and day if there is no risk of driving rains or too low a temperature injuring the flowers. Fumigate frequently before insects have a chance of doing mischief, and keep all the shoots carefully fastened in an upright position to ensure the blooms unfolding evenly. Flowers which are likely to be rather too early for a given date may be retarded by being kept heavily shaded, and as cool as possible, away from draughts and the risk of a damp air. When these are three parts developed, they may be kept in almost total darkness, and for the last few days are best cut from the plants, stripping the foliage from the stems, and immersing the latter some ten inches in bottles of water. Late buds, on the other hand, need full light, and to be kept well up to the roof glass in a temperature not exceeding 58 or 60 deg. with ventilation. Sulphate of ammonia will help such buds, as it is quickly taken up by the plant, and tends to hasten the growth, though, as so often advised, only small quantities may be safely used, which should not exceed the rate of one ounce per gallon of water. Decaying leaves and strong sucker growth need constant removal, and if possible the whole collection should be examined and rearranged, giving ample room to each plant if space can be found.

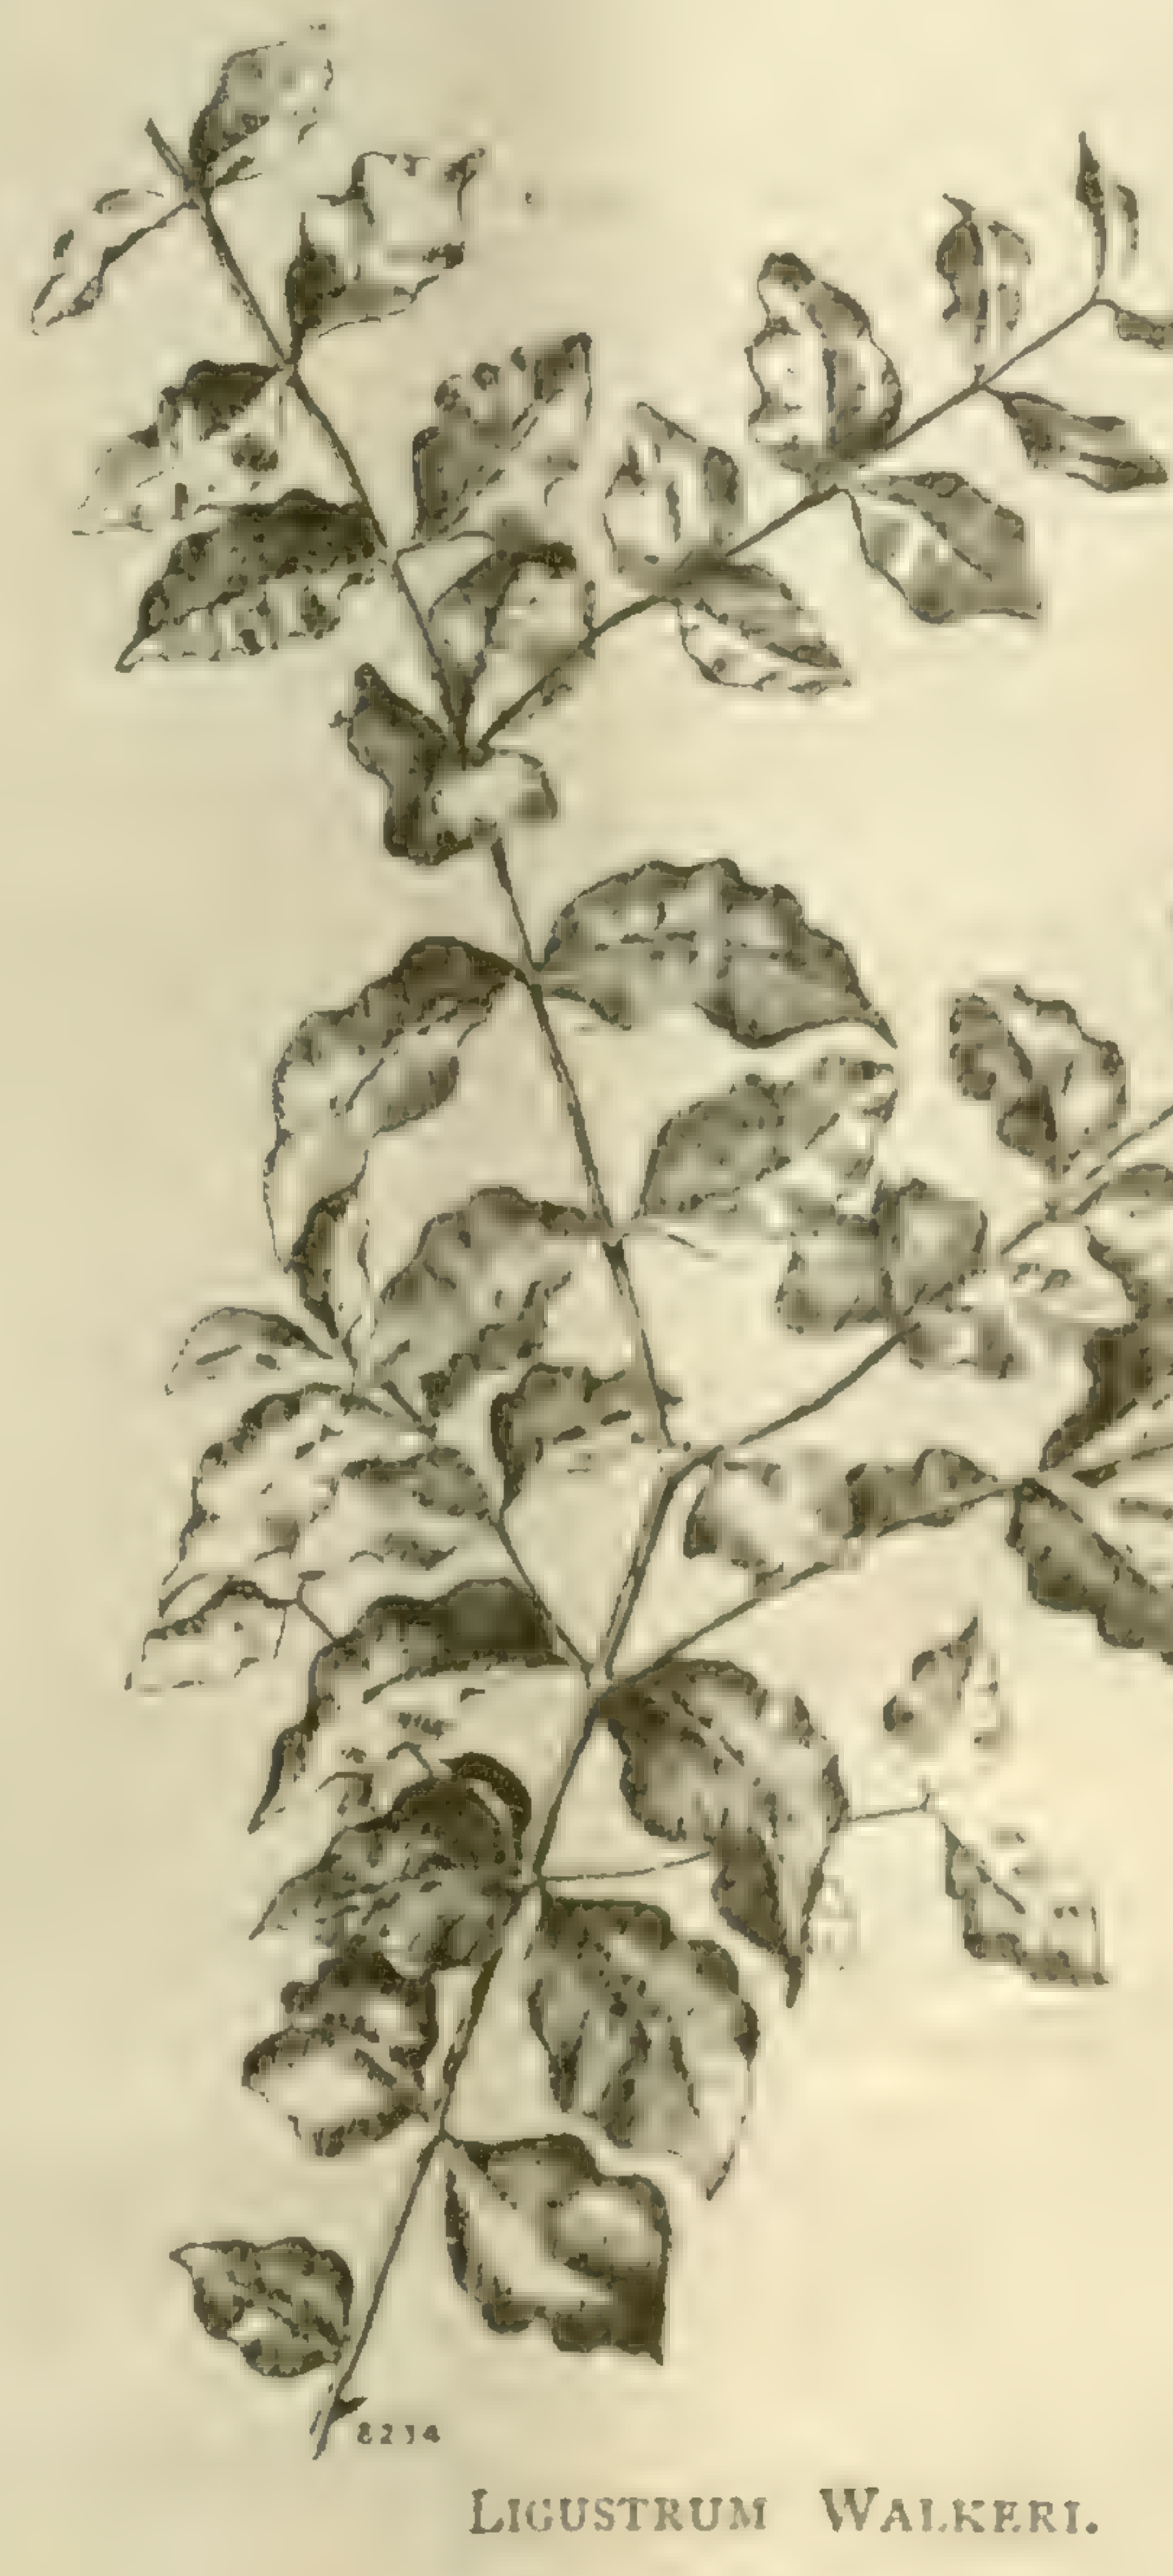
It is an old practice and a good one, to place varieties of the large petaled incurved section, of which the Queens are the most important, on front stages when the flowers are about one-third unfolded. The stakes are removed, and the shoots suspended from the roof so that the blooms hang head downwards. In this way the petals maintain their incurving form better, and it is an easy matter to attend to the removal of crowding or deformed florets, which so materially assists a perfect development. All incurved varieties need watching for similar deformities, though the forceps for this must be very carefully used, or more injury than good may follow the possible bruising of young florets in the centre of the bud.

Several novelties have very promising buds, notably one named Madeline Davis, which, if I am not mistaken, will prove a fine acquisition. General Paquié, Madame C. de Terrail, and Madame H. de Vilmorin are also likely to be first-rate sorts and of exhibition quality. Mrs. C. F. Payne, Master Tucker, Royal Sovereign, Sec. Fierens, and S. W. Gilbert also appear to warrant their inclusion in all collections. We do not find that the past fine weather has unduly forwarded the flowers, though many people express a contrary opinion. Certainly with the early border varieties it appears to have had a retarding influence. The useful Ivy Stark is much later in blooming than last year, and I am inclined to think that the extra sunshine and dry atmosphere has hardened the buds and made them open more slowly. The September sorts have been less brilliant in colour, and by no means so good as usual, and I am rather dreading a chastisement from "Lux" if his plants have not been more satisfactory than our own. However, the later varieties, which carry on the supply of outdoor flowers to November, are better, and extremely useful where large quantities of cut flowers are in demand. Just now these, with Michaelmas daisies, rudbeckias, and perennial sunflowers, are the mainstay of the hardy flower borders.

Trent Park Gardens. W. H. LEES.

LIGUSTRUM WALKERI.

SINCE the Floral Committee of the Royal Horticultural Society awarded Ligustrum Walkeri a first-class certificate the plant has been the subject of a good deal of comment among the habitués of the Drill Hall meetings. There can be little doubt but that the committee overrated the value of this privet; but, on the other hand, it does not follow that, because a plant is unsatisfactory at Kew, it must be so everywhere else. Ligustrum Walkeri is a native of Ceylon and the Neilgherry Hills, and though the young and shining green leafage is attractive, we have other plants of which the same may be said. Young, branching specimens, like those exhibited by Messrs. Paul and Son, Cheshunt, are decidedly attractive, but the plant soon grows out of this condition, and becomes somewhat straggling in habit. Then, also, the species is not sufficiently hardy to stand unprotected throughout the year even as far south as Kew. The next question to decide is whether this shrub is of sufficient value to warrant greenhouse cultivation. We are of opinion that its merits will not justify such care in the large majority of gardens. It has, however, been suggested as suitable, when properly grown, and in tubs, for the decoration of large cool conservatories or winter gardens, and for this purpose it may prove of value. The accompanying illustration is reduced from a pen and ink sketch of a small branch, to show form of leaf and growth.



LIGUSTRUM WALKERI.

NOTES ON THE CRYSTAL PALACE SHOW.

IT appeared to be the general opinion of those best able to judge that apples and pears were not quite so good as usual at this show, which fact may probably be accounted for by the very dry weather that has been so long experienced in the southern parts of the kingdom, from whence the finer and best-coloured fruits are usually forthcoming. Any deficiency, however, there may have been in these was amply compensated for in the classes for stone fruits, as it is seldom that such fine examples of peaches and nectarines as were exhibited are to be seen at shows held some weeks earlier in the season; and the end of September may be considered rather late for showing these in such good condition, especially after the hot weather that has been experienced this year. Plums, too, were a marvellous display, and it is, I think, correct to say that, taken as a whole, no finer collection nor finer individual dishes of the fruits have ever before been brought together in this country; and how some of these had been ripened, protected from wasps and insects, and the bloom preserved so perfectly upon trees in the open air, was to me a mystery. In this section of the show alone the Council of the Royal Horticultural Society may justly claim the credit of accomplishing good work by bringing before the public, and gardeners in particular, the several newer varieties of these fruits which have been introduced to cultivation in recent years. Many of these are a great advance in size and appearance upon older varieties, and being later in ripening, the season of these popular fruits is considerably prolonged. The method of staging adopted now at the Palace is also a great improvement upon that in vogue a few years ago, as not only is the fruit shown off to much better advantage by being arrayed on long tables with the classes together or in consecutive order, which makes it an easy matter to find any particular number or class of fruit instantly, but it is also of great assistance to exhibitors when staging, and saves an immense amount of running to and fro to find any particular number, or of pestering the officials with inquiries at a time when these are already closely engaged with the proper arrangement and after appearance of the show.

Galloway House, N.B. JAMES DAY.

HOMOLOGY OF PLANTS.

By Professor F. O. Bower, D.Sc., F.R.S

(Continued from page 668.)

III.—ABNORMALITIES.

The following considerations influence me in forming an opinion as to the real place of apospory and apogamy in the history of the alternating generations:—

I. The Bryophytes show remarkable uniformity of alternation; irregularities are few; apogamy is not recorded; apospory appears rarely, as a physiological refuge for the destitute plant. This uniformity goes along with the protected and dependent condition of the sporophyte. All Pteridophytes have their embryos protected while young, and this seems to have been their primitive condition. The true lesson of the Bryophites, which include the simplest living Archegoniates, seems thus to be that uniformity of alternation goes with a simple structure, and a protected or dependent condition of the sporophyte; and this we have reason to believe was the condition of the simpler Archegoniate fruits.

II. The distribution of apogamy and apospory among Archegoniates at large is very irregular; the Leptosporangiate Ferns are the headquarters; but they are a pecularly specialised phylum, with free sporophyte, exposed when mature, though protected while young. They are adapted to special conditions and show a greater plasticity of development than any other Pteridophytes. The Ferns are subject to other abnormalities than apospory and apogamy. The root may develop directly into a shoot, or the apex of the leaf into a bud. I think it has been too readily held that the Ferns occupy a special place as a key to the morphological problem. We should bear in mind how really isolated they are; they are essentially an extreme, even an extravagant type; they show the largest sporophylls in the whole vegetable kingdom, with the largest numerical output of spores from each. Many are specialised in accordance with extreme conditions of shade and moisture. These considerations should temper our view of them, not only as material for normal comparison, but also as exponents of abnormality.

III. The fact that in cases of induced apogamy in Ferns archegonia are first produced, clearly shows that in these cases the first intention of the plant is towards a normal production of embryos, while apogamy takes its place as a substitutionary growth. It may remain an open question how far direct apogamy will bear a similar interpretation.

IV. The character of the aposporous and apogamous growths is very anomalous; their position is not definite. Aposporous growths may arise from the sorus and sporangia, or from the most varied points on the margin or surface of the leaf. With regard to apogamy in Ferns, it appears, as the result of a large number of observations, that though there is an average normal of position, still any part of the sporophyte—stem, leaf, ramentum, root, sporangium, or even tracheid—may arise, independently of others, from the prothallus. Single sporangia, or groups of them, may appear without vegetative organs of the sporophyte; leaves without other parts; in one case, I believe, as many as ten roots have been seen without any other members of the sporophyte! The close similarity of the parts thus irregularly placed to those formed in regular sequence in the normal plant should be a warning of their abnormality. I cannot see in them any suggestion of a primitive state. Dr. Lang tells me that these exceptional developments form only a small proportion of the individuals in any one culture; still they are there, and those who hold that apogamous developments are a suitable basis for morphological argument must not pick and choose those cases which suit their views, but must take even the most extravagant into careful estimation. My own view is that these anomalous growths are not a safe guide to past history. But looked upon as the result of a recently-acquired transition from one generation already established to the other, following nuclear changes, in the one case of reduction after insufficient nutrition, in the other of doubling of the chromosomes following on plethora apospory and apogamy are at least intelligible. We shall understand how the transition may take place at one point or at many, while the irregularity of the parts produced offers no morphological difficulty; it is rather what might have been anticipated if the transition were a ready consequence of the conditions we have noted.

Lastly, a word on Dr. Scott's utilitarian argument. He remarks "a mode of growth which affords a perfectly efficient means of abundant propagation cannot I think be dismissed as merely teratological." We must be clear that utility is no certain evidence of antiquity. As refuges for the physiologically destitute, apogamy and apospory may play an important part *now*, and in so far are not to be dismissed as mere freaks of nature. But in my view they would rank, as regards utility pure and simple, with the formation of adventitious buds on the root-system of a poplar that has been felled; or with the bulbils which replace the flowers in so many mountain species; neither these, nor, I think, aposporous or apogamous growths, throw any direct light upon the story of descent.

To sum up then, not only do I find that the facts in our possession, including the wildest anomalies, are consistent with an antithetic theory, but a comparison of normal forms seems to me to support the opinion that the sporophyte has appeared as the result of gradual elaboration from the zygote, a fresh phase having been thus gradually intercalated in the course of evolution. The idea first clearly stated by Celakovsky in 1868, was developed by him in subsequent writings. I endeavoured to place it on a footing of adaptation to external conditions in 1890; and in 1897 we find Strasburger restating the position in terms almost identical with my own, but upon a basis of nuclear detail which had not been dreamed of when the view was first propounded. Dr Scott has enthusiastically appreciated the double verification of the forecasts of Professor Pringsheim; I think that the way in which the antithetic theory is found to work in with the nuclear details recently discovered appeals quite as strongly to my mind.

In the course of this discussion I have not been anxious to point out such difficulties as beset the homologous view; all I have attempted here has been to set aside some of the difficulties which have been suggested in opposition to an antithetic view, and to show that the latter theory will adequately cover the facts.

Returning now to our general inquiry on homology, we see that on the antithetic view the two generations are not *homogenetic*; but they may be in a high degree *homoplastic*, and this homoplasy may be impressed upon the two generations, even in the same species, as in some Lycopods. I have never felt the cogency of the fact that the gametophyte of *L. cernuum* is somewhat similar in outline to the young sporophyte. Both generations are exposed to similar circumstances, and may be reasonably expected to have reacted alike. Moreover, the similarity of form of the "leaves" of prothallus and plant is but slight, and is not maintained in allied species. Their arrangement is variable. Between them also lies the essential structural difference, so widespread among Archegoniate plants, that in the sporophyte stomata and intercellular spaces are present, in the gametophyte they are absent. These are just such differences as point to homoplastic development. Most commonly, however, the homoplastic development is only seen in distinct organisms, and in this sense we shall rank the leaf of the Moss as the homoplast, but not the homogene, of the leaf of a Lycopod or of a Fern.

Theory of the Strobilus.

Some years ago I submitted a theory of the strobilus in Archegoniate plants. Comparisons were drawn between Pteridophytes and Bryophytes, and it was suggested that the origin of the strobilus of the former was "from a body of the nature of a sporogonial head." I specially pointed out at the time that my object was not a mere hunt after homologies, but to obtain some reasonable view of *the methods of advance* in Archegoniate plants. I wish to lay special stress upon this, for some appear to think that by denying an homology which I have not been at pains to maintain, they invalidate this search after the methods of advance. The Bryophytes as we now see them are our best guides in the search after these methods, even though they may not have been in the direct line of descent of Vascular Plants. As regards the comparison of the strobilus with a sporogonial head, I wish to make it clear that a *Moss* sporogonium is not specially indicated. The expression used has been "the origin of the strobilus from a body of the nature of a sporogonial head"—that is simply a part of the sporophyte which bears spores internally as distinct from a lower vegetative region. We see in more than one sequence of Bryophytes how in a sporogonial head, as thus defined, the spore-production becomes restricted in extent, and relegated towards a superficial position by the formation of a central sterile mass. I am ready to join Dr. Scott, in his confession of inability to find anything like an intermediate form between the spore-bearing plant of the Pteridophyta and the spore-bearing fruit of the Bryophyta, and to agree that at the best there is nothing more than a remote parallelism not suggestive of affinity; but none the less I think we should continue to search among the Bryophyta for suggestions as to the *methods* of advance, and to have confidence in transferring these ideas across the gulf, for I believe this to be both a reasonable and a promising method of study.

(To be continued.)

ECCREMOCARPUSES.

Few hardy climbers are more effective when grown under suitable conditions than this little family. The genus consists of two species, one a native of Chili and the other of Peru. Both are fairly hardy in most districts, but quite so in the South and West of England, fine specimens being frequently seen in southern gardens. I noticed recently, in the neighbourhood of Byfleet, Surrey, a fine specimen of the best known species, Eccremocarpus scaber. It was growing on a south wall, was quite fifteen feet in height, and several yards wide; its handsome flowers being produced in great profusion. It was made more effective by a large plant of Clematis coccinea growing near, the branches and flowers of which had intermingled, and the brilliant scarlet of the clematis contrasted well with the striking colour of the Eccremocarpus. The flowers are produced freely from July to September, the tubular-shaped blossoms being crowded on the racemes, and of a deep orange-red or scarlet colour. The leaves are deep green, bi-pinnate, ovate, cordate, and sometimes serrated, terminated by a conspicuous spiral tendril, and altogether very ornamental. A name adopted by some authorities for this plant is Calampelis scaber, and under this it was described by Sweet in his "British Flower Garden," Series II., p. 30. Eccremocarpus scaber was introduced from Chili in 1824. A fine garden form is sometimes met with under the name of Eccremocarpus scaber rosea, differing only in the colour of its flowers, which are salmon-rose. It is well worth cultivating, forming an agreeable contrast to the type.

The Peruvian species, Eccremocarpus longiflorus, introduced in 1825, is distinct from the Chilian. Its tubular flowers are longer, yellow in colour, with a distinct greenish limb, while its leaves are deep green, bi-tripinnate, and its leaflets oval, entire, and sessile. It flowers during July and August, and although rare in cultivation, is quite as easily grown as E. scaber. The vigorous growth of the species renders them valuable for covering walls, trellises, or pillars quickly. Their culture is very easy, as they thrive well in any rich sandy loam. They are readily increased by means of seeds, which, if sown in heat during February and March, will produce plants to flower during the latter part of the same year; and also by cuttings of the young growths, taken during July and August, provided they are kept in cold frames during the winter.

Woking. E. Scaplehorn.

Peach Trees.—In the neighbourhood of Taunton this season I have had peach trees drop their leaves, twice with the aphis before the flower, and after the fruit had been set. I thoroughly syringed the trees with aphis wash before and after, but I found that syringing with a half-pint of paraffin to twelve gallons of water has kept them in abeyance, and the trees are in a healthy state, and scarcely any of the fruit has dropped.—J. H. S.

TRENT PARK GARDENS, NEW BARNET.

The name of this excellent establishment has gained enviable notoriety during recent years, more particularly on account of the high quality of the chrysanthemums which have been grown here, and achieved such distinction in the principal towns and cities of the United Kingdom during recent years. A visit to the gardens at all times is particularly interesting, and especially so at the present, as the near approach of the chrysanthemum season brings with it increased interest owing to the high positions always attained by Mr. W. H. Lees, the excellent and able gardener to F. A. Bevan, Esq. All eyes will be directed to efforts made by Mr. Lees this season, and readers will, doubtless, be interested to learn how fares the collection of plants under the skilful treatment of this master-hand.

It is safe to state that the chrysanthemums are a particularly promising collection, and the buds being admirably timed, notwithstanding a most exceptional summer season, there is every reason to suppose a good account will be given when the blooms are staged upon the exhibition table. A handsomer lot of plants it would, indeed, be difficult to imagine, and this year they are characterised by well-ripened wood, nice stocky growth, stout leathery foliage, plump, fast developing buds, the plants as a whole being absolutely devoid of coarseness. Failures have been recorded in the collections of many growers in different parts of the country, but in this instance there have been very few indeed; in fact, hardly sufficient to notice. The buds of Madame Carnot and its sports have caused many growers to bemoan their fate owing to the loss of the most promising through a kind of dry rot, but in the Trent Park collection these are represented by a beautifully even lot of buds, which are developing easily and kindly. There is said to be a pink Madame Carnot, and if this is indeed a fact there is a hope of seeing this variety staged in some of the keenest competitions of the present season. We noticed a fine lot of Matthew Hodgson in various stages of development, and as this is without exception one of the finest crimson-red Japanese extant its value will be highly esteemed. Royal Sovereign promises well; so, too, do John Neville and Joseph Brooks, introduced last season with considerable promise. A variety likely to receive the attention of those who value a good thing when they see it, is Madeline Davis, a flower of the most delicate colouring, and also of the most chaste description. Other novelties, such as Joseph Chamberlain, Mary Molyneux (very tall, attaining a height of almost five feet before a natural break was made), President Nonin, Secretaire Fierens, the latter two being two of the best of M. Ernst Calvat's last season's novelties; Chatsworth, Ella Curtis, Madame G. Bruant, Julia Scaramanga, Mrs. F. A. Bevan, Oceana—this latter variety being grandly represented—are just a few of the newer kinds destined to play an important part at the forthcoming shows. Very fine plants of Mrs. H. Weeks, some grown in the ordinary way and stopped early in the season, and others rooted early in the spring, and the first bud developing secured, showed how amenable is this variety when properly treated. Of the Viviand Morel family of plants there were some splendid examples, and these gave promise of producing blooms of exceptional merit.

The incurved varieties were also admirably represented, the "Queens" being characterised by neat and even growth, rich green foliage, and buds secured in excellent time for the November shows. The footstalks to the buds were stout and erect, proving conclusively that the plants possessed the necessary vigour to build up deep, globular flowers. The "Princesses" were also coming along in promising style, so there is the prospect of seeing this handsome type of the chrysanthemum in good form as of old. The newer sorts were also noticeable, including such varieties as Miss Dorothy Foster, Miss Violet Foster, Mdlle. Lucie Faure, Madame Ferlat, Mrs. N. Molyneux, Ernest Cannell, besides many others, and to these must be added such typical varieties of those a little older, and represented by Charles H. Curtis, Globe d'Or, J. Agate, and a few more which have achieved distinction. Taken as a whole, they are distinctly the best lot of plants it has been my good fortune to see thus early in the season, and the forecast of ultimate triumph is decidedly cheering. Mr. Lees is particularly careful not to overcrowd his plants in his different houses, so that they may be examined with comparative ease, and this is no mean advantage during the work of the next few weeks. Ample ventilation is always afforded, and the blinds lowered during bright sunshine. All the plants were housed before the last week in September, which must have been a consolation when it is remembered that there were several experiences of frost at this time.

The early varieties are appreciated at Trent Park, both for their value as plants for border decoration, as well as for use in a cut state, and for this work they are considered most useful. As with other growers, the collection here was later in flowering this season than is usual, and some of the well-tried varieties have lost much of their colour. Those chiefly grown for this purpose are Madame Marie Massé, Ivy Stark (one of the best for outdoor culture), Madame la Comtesse Foucher de Cariel, Vice-President Hardy, and Ryecroft Glory among the Japanese; and a few pompons, including Blushing Bride, Fred. Pelé, and Flora. A white Japanese variety for pot culture, and grown in bush form, is Lady Fitzwygram, this being invaluable for cutting.

The display of Michaelmas daisies is a very good one, and these are pleasingly displayed in a long border with a northern aspect. The abnormal dry season has had its effect here, and although the effect is very fine, on close inspection one can see how much the drought has affected the plants. Several very handsome varieties are already over, although they should now be at their best, and others fall far short of what they should be in a normal season. Nevertheless, they demonstrated most effectually their value as an indispensable plant for the harder border, as when judiciously disposed in the border, a very graceful and pleasing effect is easily brought about. The most conspicuous among them were Aster [illegible] bessarabicus, A. cordifolius elegans, A. cordifolius Diana, A. Coombe Fishacre, A. multiflorus, A. Novæ-Belgi densus, A.N.-B. Robert Parker, A.N.-B. Harper Crewe, and A.N.-B. lævigatus, and others to succeed. The hardy border is always pleasant to look upon, and at the time of my visit was aglow with many free-flowering subjects. The Japanese anemones were very fine, as were helianthuses in variety, the finest of them, Miss Mellish, looking particularly handsome, with quite a host of other subjects too numerous to mention. Four long borders are devoted to roses, and many of these were, naturally, plants with a past. H.P.'s are represented by masses of the best known sorts, such as Mrs. John Laing, and hybrid teas by La France. Teas and noisettes were still blossoming freely, and some of the most charming of the garden roses were also in evidence.

A new terrace garden recently constructed on what was previously a slope, with a northern aspect, was one of the most interesting and pleasing features of the outdoor garden. The borders were full of bright-flowering plants, even thus late in the season. A grand effect has been obtained by planting subjects of a kind in masses, and the importance of this arrangement was best appreciated when the whole display was viewed from the upper terrace. Even so late in the season as the occasion of my visit, pentstemons were making quite a brilliant display. Early-flowering chrysanthemums, tuberous-rooted begonias, cannas, &c., in large blocks, made a most striking and glorious array of colour with their blossoms, and the free use of violas in many of the newest varieties, chiefly represented by William Niel, Ethel Hancock, Princess Louise, Bella, Rosea pallida, Isa Fergusson, Mrs. C. F. Gordon, Harepema, and Duchess of Fife, showed the wisdom in the selection of the subjects used for this purpose.

I must not omit to mention a fine house of Muscat of Alexandria grapes, in which many handsome exhibition bunches were hanging, the berries being large and well coloured. There were other houses of interest, but space prevents further details. The estate of Trent Park is charmingly situated, and it would be difficult to find its equal so near to town, with its delightfully undulating landscape, well timbered, and just now assuming its autumn garb. In the generous proprietor, Mr. F. A. Bevan, it is exceedingly gratifying to know that the world of horticulture has such an enthusiastic supporter, and the greatest credit is due to him for the encouragement given to those whose privilege it is to care for his beautiful gardens and pleasure grounds. VISITOR.

REMEDY FOR CHRYSANTHEMUM RUST.

TOGETHER with many other growers I attended the conference of the N.C.S. on the subject of chrysanthemum rust on October 11. I had intended giving my experience of the pest, but the time allowed for discussion was rather short, and I waited over-long to hear what gardeners had themselves done to cure or prevent it. None, however, came forward, at least with one exception, and he had no experience with the pest; all the others were trade growers who took part in the discussion, and only one of these had a remedy to propose, so far as I could hear. So far as the petroleum (paraffin) treatment is concerned, my experience differs from that of Mr. Wells, for I tried it in the spring of 1896, when the rust first made its appearance in our collection, but it was of no use at all, for it did not stop the pest from spreading over the two plants experimented with; neither did quassia water, clear lime water, Bordeaux mixture. There were eight plants of Lord Brooke attacked by the rust, so I put these alone in a small house and labelled the pairs of plants I syringed with each mixture, so as to avoid mistakes. For five weeks I syringed these plants twice a day with the mixtures mentioned, but to no purpose, for every plant was worse at the end of that time than when I started, so the furnace was used to prevent the fungus spreading to the collection of 1,500 plants we were growing that year.

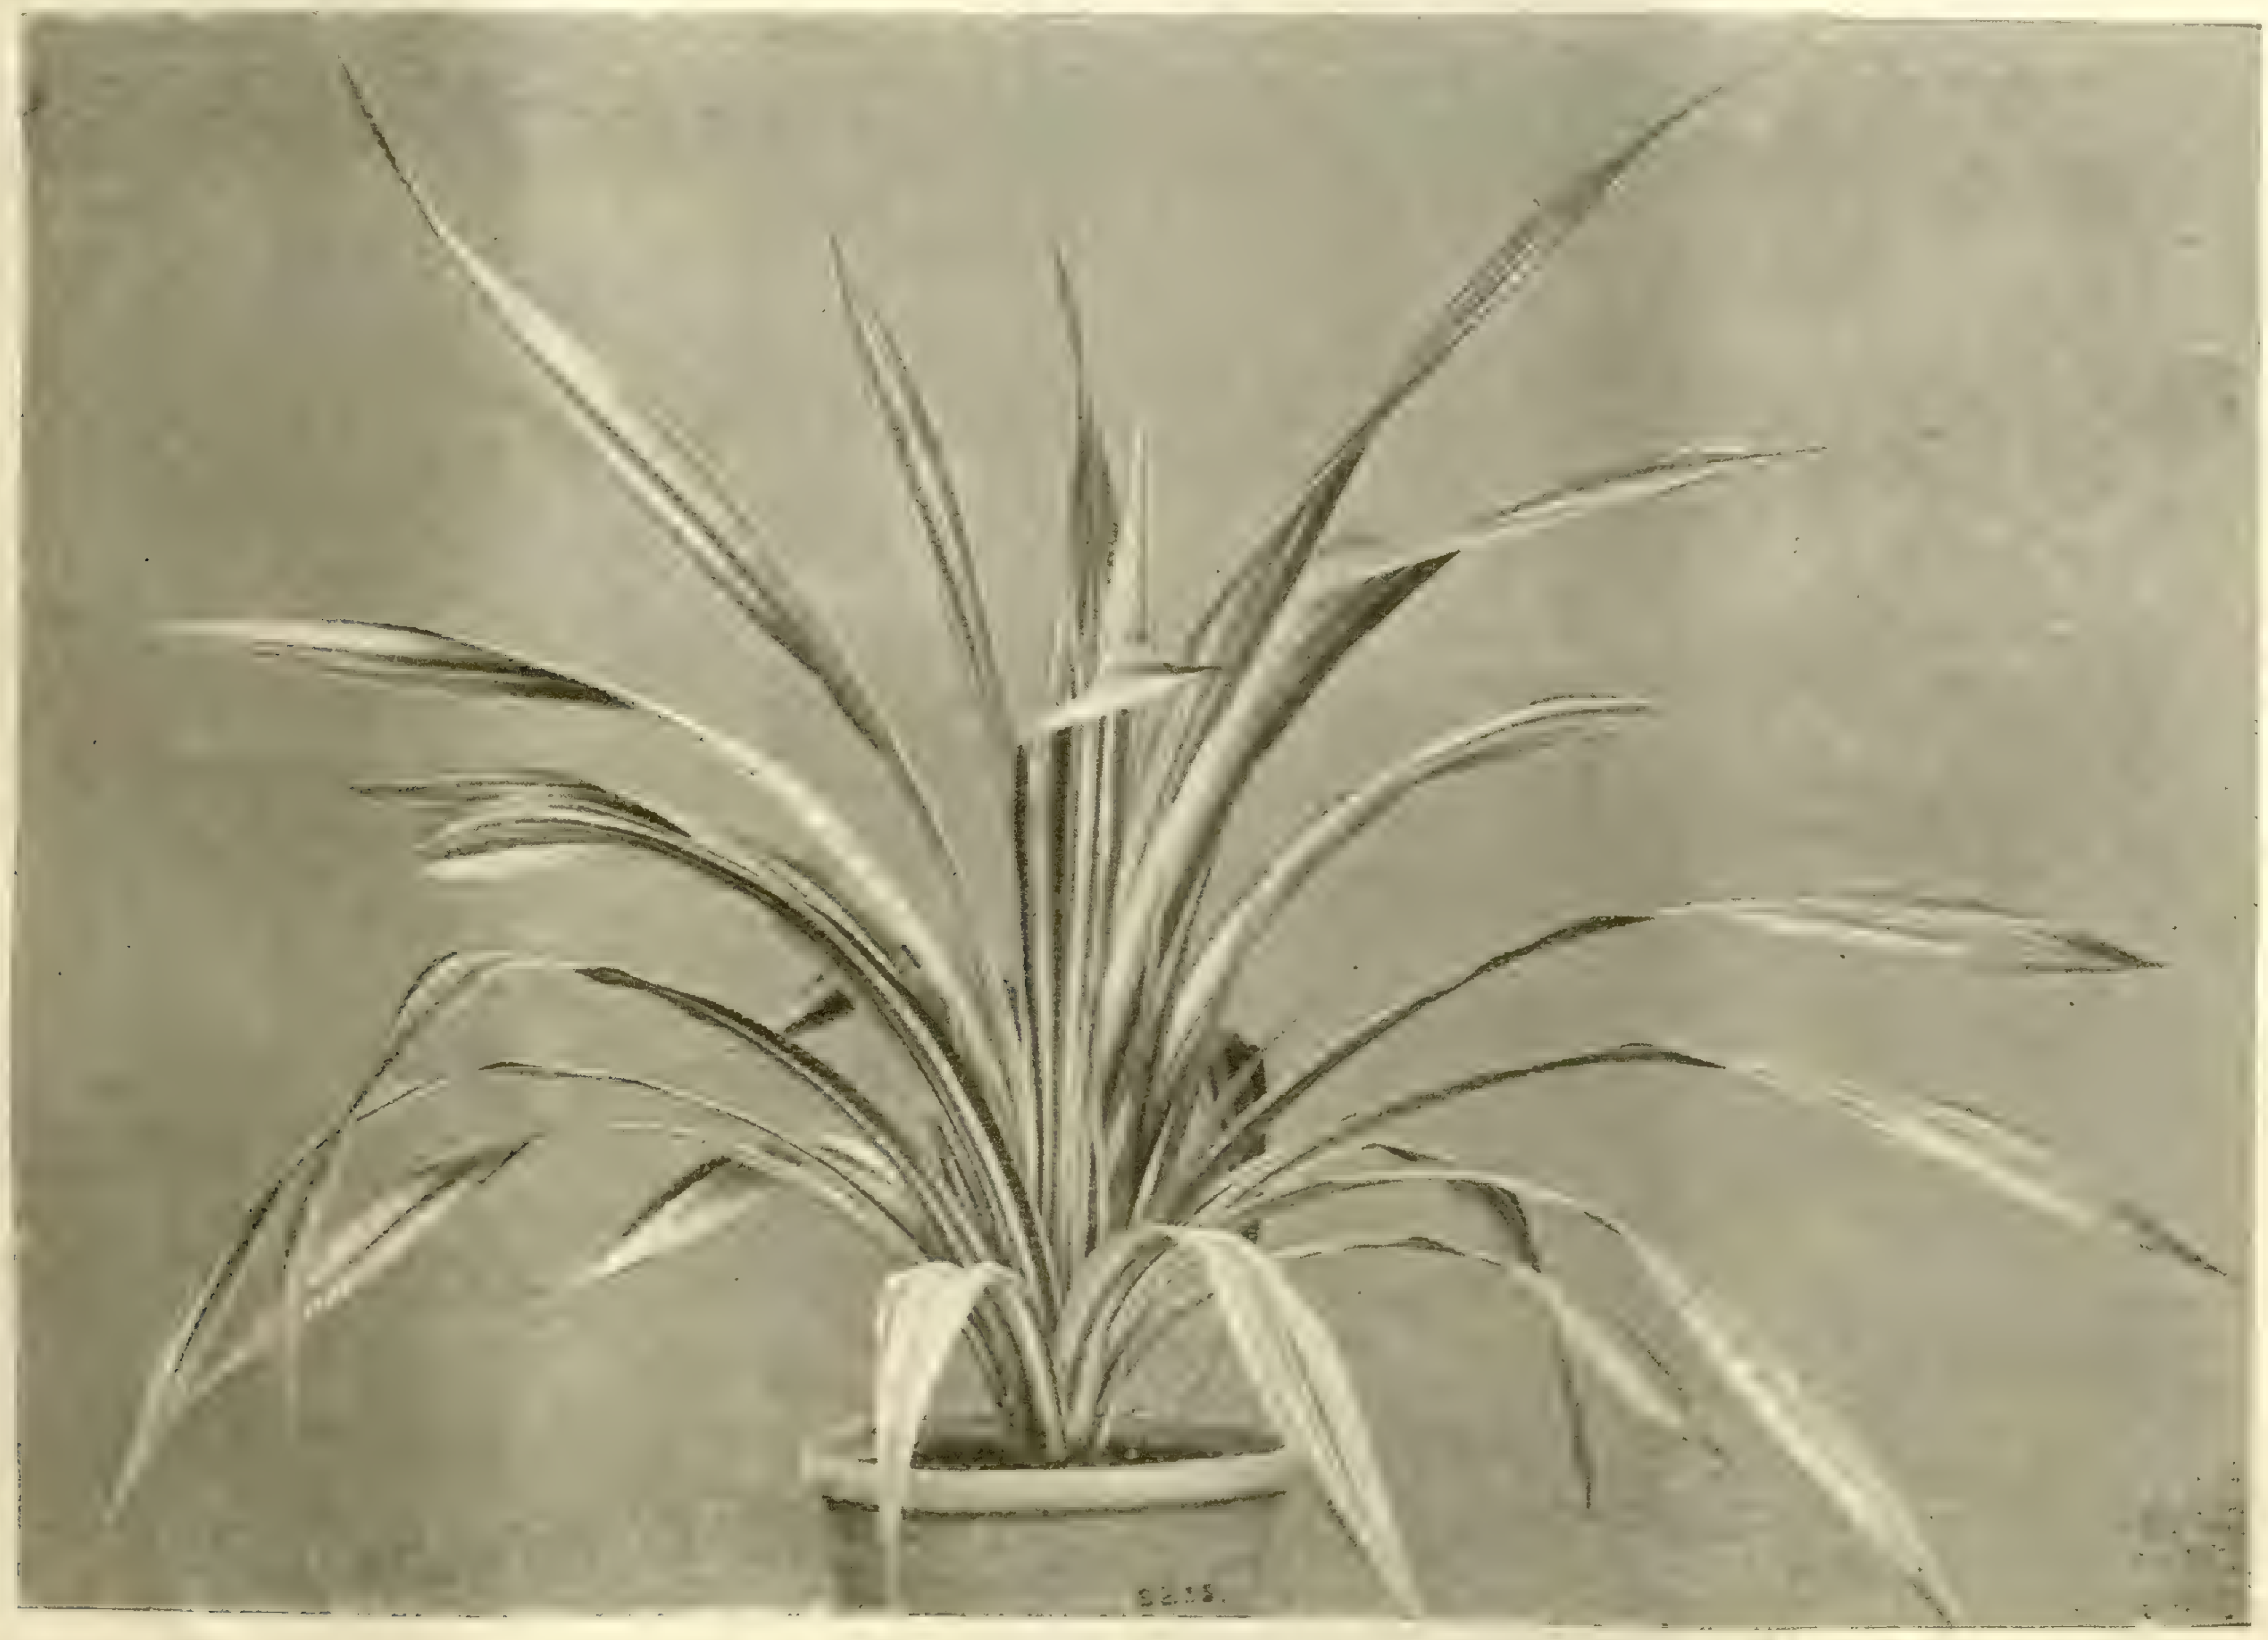
We saw no more of the chrysanthemum rust until the end of July, 1897; then we had two or three cold, damp nights, and a day or two afterwards I noticed a few spots on such varieties as Mrs. S. C. Probyn, Miss E. Zeichman, H. L. Sunderbruck, Niveus, Julia Scaramanga, James Myers, and a few others, but those named were the worst, though curiously enough these were not all in the same yard, but some were at one end of the garden and some the other. Altogether there were forty-three plants out of the 2,000 grown that had these rust spots, and in every instance the leaves that had the spots were from a foot to fifteen inches from the first break. Remembering that I had to burn the plants of Lord Brooke after five weeks' syringing, I thought I would either kill or cure this lot, so I decided to make a strong solution of Kill-m-Right, and give that a trial. The affected plants were put together in the melon ground and syringed twice a day for a week, then I found the rust had ceased to spread, so syringing was done once a day in the evening; at the end of three weeks all the leaves that were affected—those parts that were infested by the fungus—had dried up, so that when taken between one's finger and thumb the diseased portions crumbled up to dust, leaving the rest of the leaf sound, although unsightly. Some of the "cured" leaves remained on the stems until the plants were cut down for storing.

This year, 1898, there has not been a sign of rust on any of our plants, as the precaution was taken to syringe them regularly twice a week during April, May, August, and September, and once a week during June and July; this we consider has prevented the rust attacking our collection. The following is the method of preparing Kill-m-Right for stocking against rust: Three pounds Kill-m-Right dissolved in two and a half gallons of boiling water, well stirring the whole until cool. For use we put a sixty-sized potful of this liquid into two gallons of rain water, in a wooden bucket; this is sprayed on by means of a syringe, using the jet and one finger to make a spray to reach the under surface of the foliage; the two gallons will suffice for about 160 plants, spraying both sides of the row.

Wimbledon House Gardens. T. DOSSETT.

PANDANUS SANDERI.

As a companion plant to Pandanus Veitchi and for general usefulness for table decoration P. Sanderi cannot fail to become popular as it becomes better known and its price declines. There is a great general resemblance between the two plants, and at first sight the difference of colour is the only one readily recognised. Nevertheless there are probably sufficient points of distinction to warrant specific rank for the new comer. It has rather longer leafage than P. Veitchi, while these are armed along the margins with very small spines; the habit of the plant is also rather more dense than that of P. Veitchi. The long sword-like leaves of P. Sanderi are variegated prettily with bands of creamy green and yellowish green alternating with a darker green ground colour. This variegation is not confined to margin or centre, but is spread over the whole surface, and is as evident in a small plant as in a large specimen. Our illustration, reproduced from a photograph taken specially for us at the St. Alban's Nurseries, gives a very good idea of the elegant contour of a well-grown example, and shows how useful such a specimen would be either for home decoration or the exhibition table. A large plant was staged by Messrs. F. Sander and Co., its introducers, in their splendid group of novelties at the Ghent Quinquennial Exhibition of April last, as noted in our report of that show given in our issue of April 23. Since then plants have been repeatedly shown in London, and on September 20 last the St. Alban's firm had the satisfaction of seeing their introduction stamped as "first class" by the Floral Committee of the Royal Horticultural Society.



PANDANUS SANDERI.

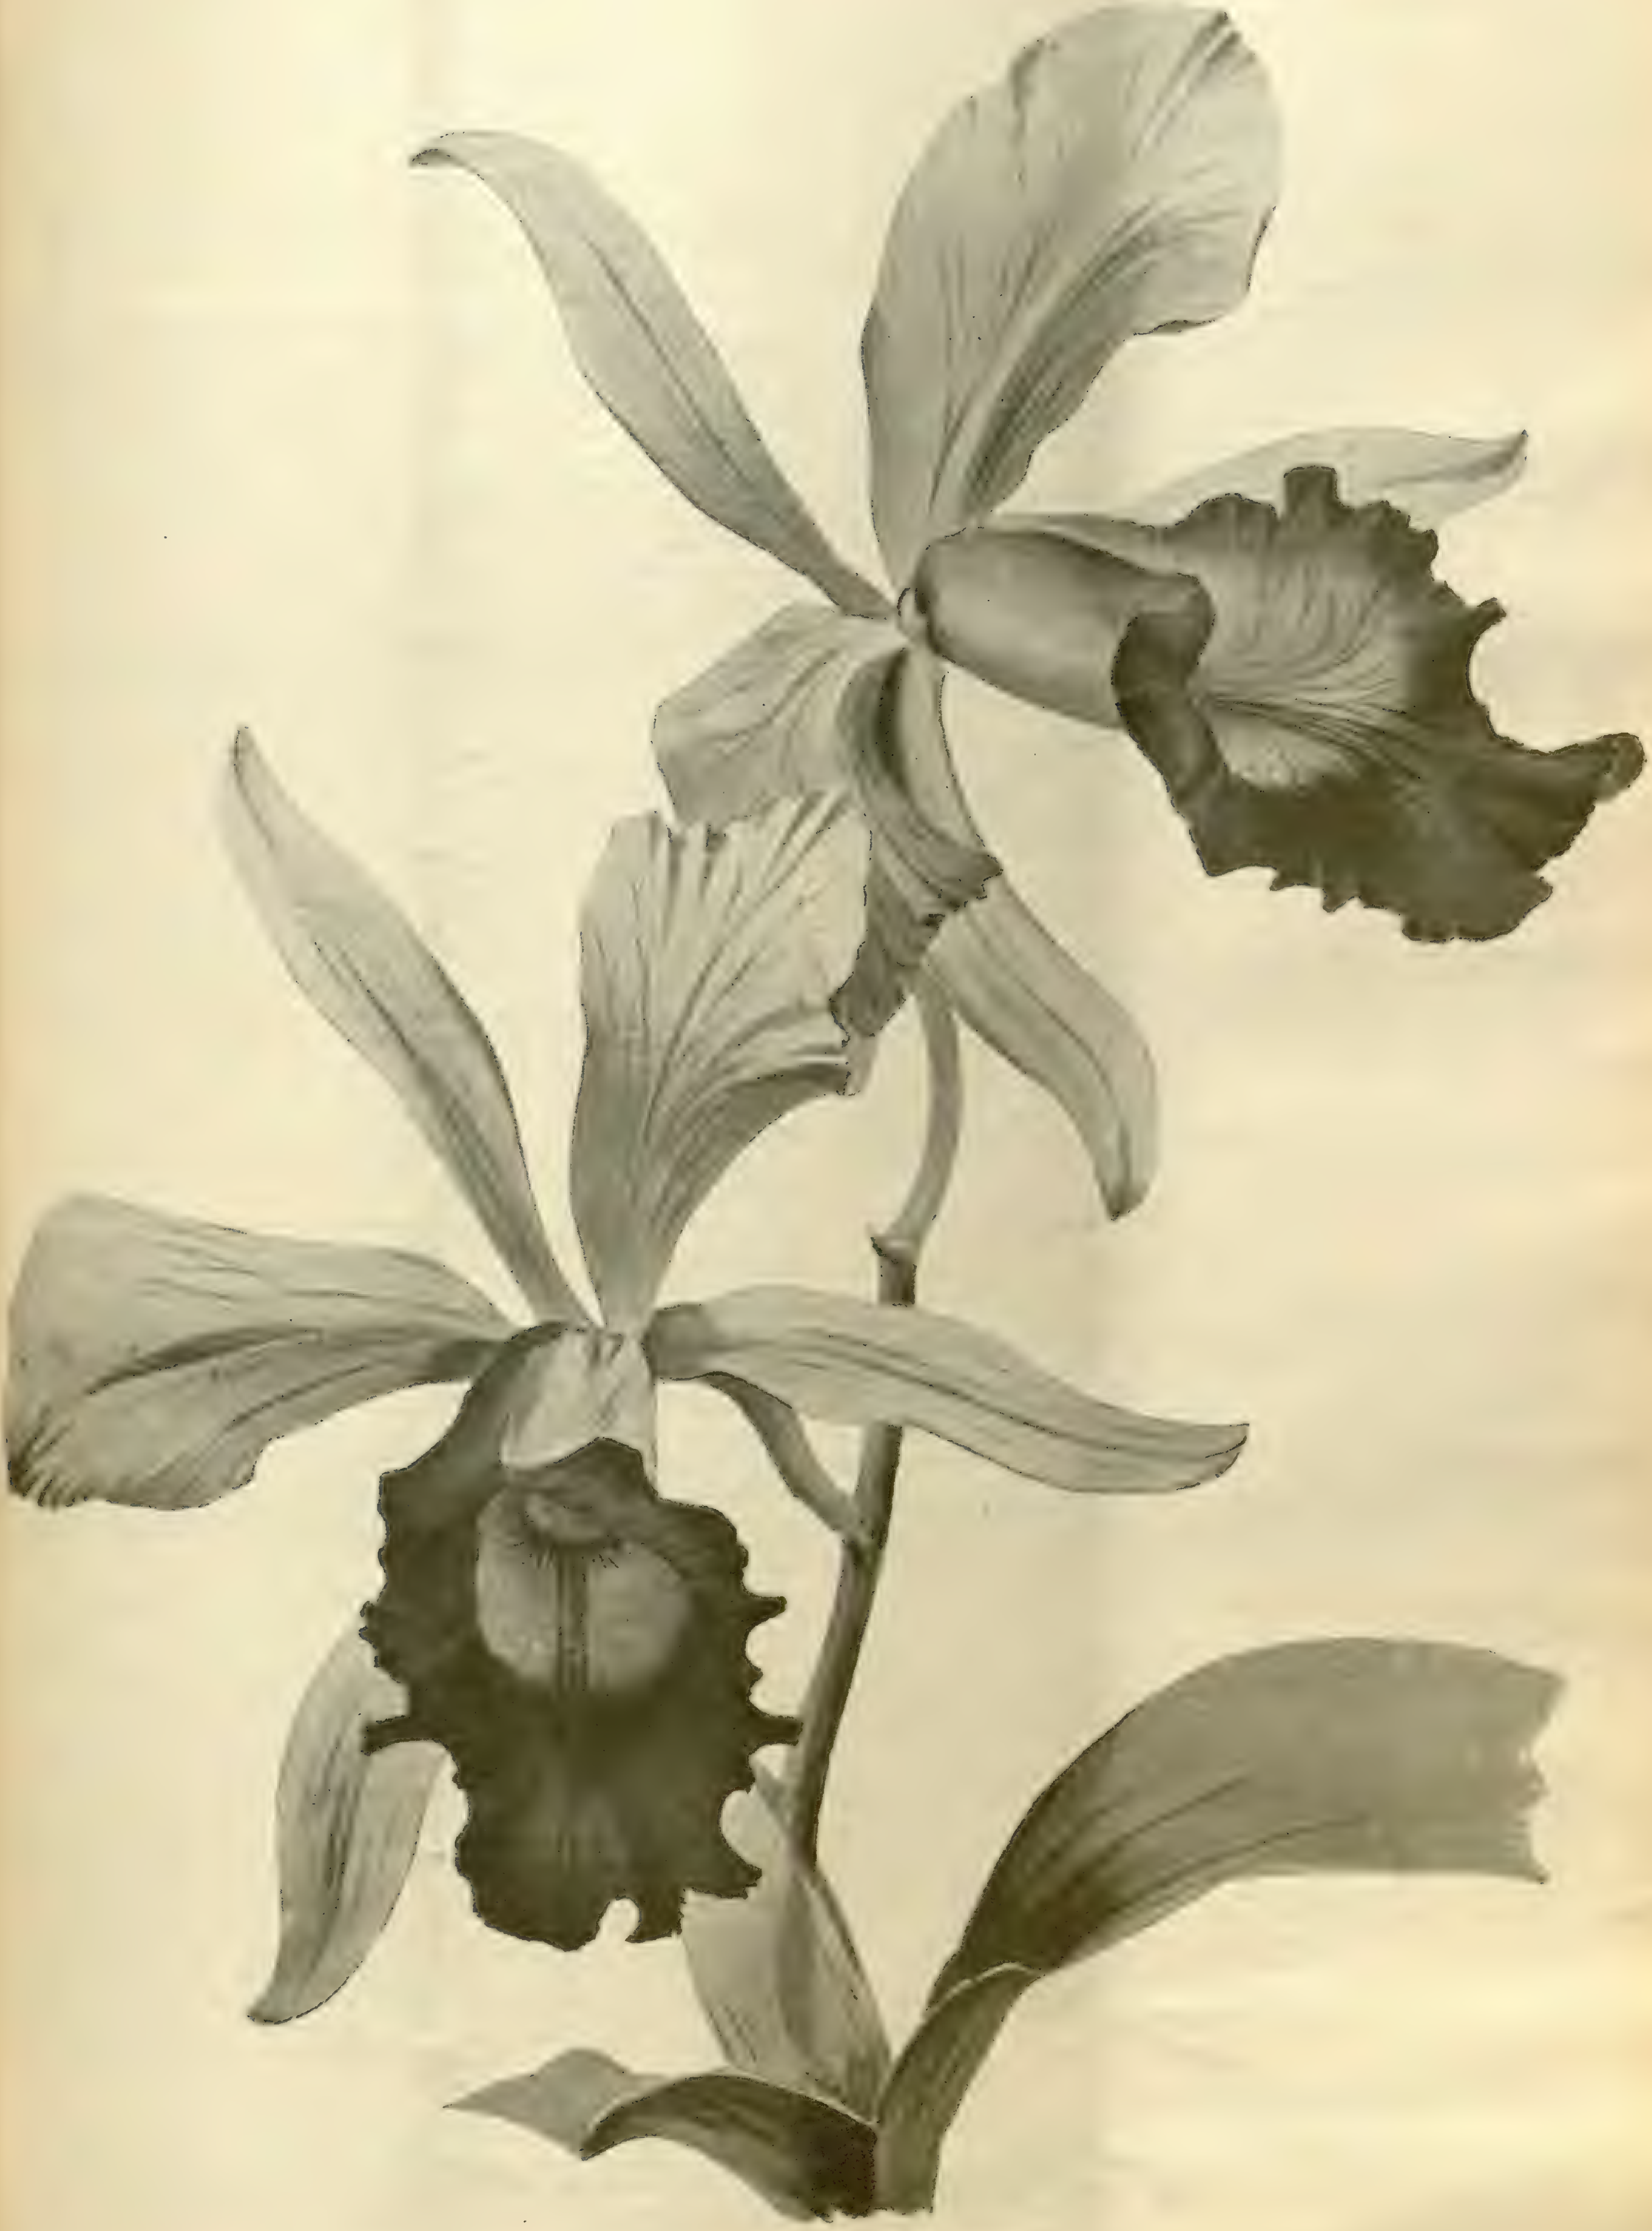
New Fruit Trees.—Although the soil is yet dry in lifting and planting fruit trees, without doubt orders are flowing into the nurseries, and there rain is awaited impatiently to enable the work of lifting to be proceeded with. But even with a good rainfall it must be some time ere soil and roots become thoroughly moist, and for that reason those who wait not for the rain but have trees in at once will do well to have the roots placed in water for a night preparatory to planting next day. Sometimes, even when we have a moist time, roots are exposed appreciably in transit, and reach the purchaser rather dry. Nothing helps to put the roots in proper form so readily as a good soaking in water and a proper trimming with a sharp knife prior to planting.—A. D.

Autumn Sown Onions.—My recent note on these subjects in reply to a criticism by Lux conveyed a meaning totally diverse from what I really intended to convey. I do not wish to induce framers of schedules to change the terms of their ordinary class, "Autumn-sown Onions" Nothing could be further from my desires. But what I do want is, that exhibitors in this class should sow and grow the finest varieties for such class, such as we ordinarily sow in the spring. Anyone who saw the onion trial at Chiswick this year would have come to the conclusion I have long held, that the harder round and globe forms of what we call the Spanish section of onions are by far the best. Then I should like to see those who are so constantly and so stereotypedly advising the sowing of tripolis in the autumn, simply because their fathers did so, reject that old fetish, and advise the sowing of the varieties or forms I have referred to. At Chiswick Mr. Wright has kindly promised to preserve, as well as he can, bulbs of the best varieties in the recent trial, and state the results. I can have no present doubt but that the bulbs of the harder forms will keep sound months after the tripolis, white, red, or otherwise, are rotten. We have in spinach sowing yet another fetish of the same kind. Calendar writers persist in saying sow round spinach in summer, and prickly spinach in autumn, meaning thereby the round and prickly seeds of the Flanders variety. They seem to be absolutely ignorant of the fact that the finest summer spinach is the large-leaved Long Flanders, and the finest winter sort is the Viroflay or Victoria.—A. D.

LÆLIO-CATTLEYA HENRY GREENWOOD.

This is an exceptionally handsome Lælio-cattleya, and, judging from its free and robust habit, is one that is likely to eventually obtain a permanent position in orchid collections, for there can be no question as to its beauty when in flower. We first saw this orchid at Ghent, in April of the present year, when, at the Ghent Quinquennial Show, it was so greatly admired by the jury that the members unanimously awarded it first prize as the best new hybrid orchid, and raised the prize from a silver to a silver-gilt medal as a recognition of its merit. On that occasion L.-c. Henry Greenwood was exhibited by Mons. Charles Maron, of Rue de Montgeron, Brunoy, Paris, who is also the raiser. The parentage was given as Lælio-cattleya Schilleriana var. Stelzneriana and Cattleya Hardyana. The flowers, as represented in the accompanying page illustration, are as large as those of good forms of C. gigas, and are extremely beautiful and novel in form and colour. The rather narrow sepals were very pale lilac in the case of the handsome plant shown at the Drill Hall, on the 11th inst., by Messrs. B. S. Williams and Son, Holloway, but they were lighter in colour, almost white, on the plant we saw at Ghent; the petals are much broader and brighter, the veinings of rosy-purple spreading over a greater part of the pale rosy lilac ground colour. The labellum is magnificent; the side lobes meet over the column, but have their tips rolled back, and of a bright purple colour, a shade that spreads into the broad apical lobe until it is lost in the intense crimson-purple area that occupies nearly the whole of it. The throat is bright and soft yellow, save for a central band composed of lines of dark purple. The margin of the lip is waved and crisped into a narrow frill that has a wire-edge margin of palest lilac. Messrs. Williams' plant, which our illustration represents, carried two flowers, as shown, and the Orchid Committee considered it worthy of an award of merit. Many orchids of equal merit have gained a F.C.C., and perhaps this will some day, if shown again, for to our mind it deserves such an award.

Tomatos.—When looking through a range of span-roof peach houses at Tewkesbury Lodge, Forest Hill, recently, where the peach and nectarine trees are trained crosswise to wire trellis, I noticed that against the iron uprights on the alley sides of these trellises, the supports running up to the span-roofs, that single plants of tomatos were growing, and they had each reached a height of about eight feet, with foliage right to the bottom. The varieties were the fine red selection of perfection named Polegate, and that nice golden yellow variety, Royal Jubilee. All the plants were carrying very full fruits, those of Polegate being especially handsome, richly coloured, and perfect in form. No assumed new tomato I have seen anywhere is superior to this selection. Where so many so-called new ones are put up as distinct, it is well to have ample knowledge of what good ones there are in commerce, and what their qualities are as to cropping. Mr. Taylor, the gardener, said that he expected to take during the season fully twelve pounds of fruit from each of these plants. What new variety can excel such productiveness? Some others planted against the side of the houses, and rather loosely trained semi-horizontally, were also fruiting finely. The demand for these fruits is here very great, and it is needful to have all available house space occupied to keep up the supply. Of course, the plants are growing in the peach border, which is, however, very firm, as the local loam is so stiff in texture, that it has to be tempered very much by a liberal addition of burnt earth. No doubt, this substantial character of the soil has much to do with the constant production of such splendid grapes year after year.—A. D.



LÆLIO-CATTLEYA HENRY GREENWOOD.

The Plum Crop.

Anglesey.—Plums do not succeed in Anglesey, and even on walls they are a very poor crop. This season I have not seen a single plum on any of the trees in our orchard; we only planted the trees in the orchard five years ago.—W. Hunter, *Barron Hill Gardens.*

Berks.—For dessert, plums are here nearly all grown on walls, and have been better than usual this year. The following sorts give a long season, in succession, and if care is taken to preserve the bloom they furnish a very attractive dish, and many are delicious: Angelina Burdett, Belle de Septembre, Coe's Golden Drop, Cox's Emperor, Denniston's Superb, Early Prolific, Gisborne's, Golden Esperen, Green Gage, Golden Transparent, Blue Impératrice, Jefferson's, Kirke's, Pond's Seedling, White Magnum Bonum, Monarch, Prince Englebert, The Czar, Victoria, and Washington. Reine Claude de Bavay, Victoria, and some others bear very well on standards, and are useful for preserving.—Owen Thomas, *Royal Gardens, Windsor.*

—— Plums are under an average crop; our best sorts on walls are Rivers' Early, good; Orleans, Kirke's, Jefferson's, Green Gage, Prince of Wales, Victoria, and Golden Drop; on standards, Victoria, Pond's Seedling, and Denniston's Superb.—J. Tegg, *Bearwood Gardens.*

Berwick.—Plums have been fairly good; Green Gages have been a better crop this year than last; Victorias, good; Magnum Bonum, very good. We had to pull the fruit before ripe because of the injury done by wasps, of which I never saw such a host before.—J. Foster, *Paxton House Gardens.*

Bucks—Plums have been a rather thin crop generally; Victorias, a heavy crop; Green Gage, very poor, although the fruits were large and fine; Gisborne's, a very heavy crop; Pond's Seedling, a good crop; Purple Gage, good; prunes were very thin, and damsons much under the average.—J. Smith, *Mentmore Gardens*

Cardiganshire.—Plums were a good crop in this district, and of good quality. Victoria was the best, followed very closely by Orleans, Jefferson, Pond's Seedling, Kirke's, Magnum Bonum, Washington, Green Gage, and Golden Drop. The wasps were very trying, and damaged the plums considerably. They were rather later in commencing, but have more than made up for lost time.—R. C. Williams, *Crosswood Park Gardens.*

Cork.—Plums are much below the average. Coe's Golden Drop, Jefferson, Monarch (cannot be too highly recommended for late kitchen plum), Orleans, Victoria, Rivers' Early, Green Gage, these have borne average crops on walls; pyramids, no fruit, in consequence of the cold spring after a mild winter. Sap checked and blossom destroyed, not by frost, but long continued low temperature. —W. Osborn, *Fota Gardens.*

Cornwall.—Plums were a very slight crop. Victorias, very good; Goliath, average; Orleans in variety, good; all other sorts were a failure.—G. J. Richards, *Mount Edgcumbe Gardens.*

County Down.—Plums, with the exception of the gages, were an average crop, such varieties as Goliath, Washington, Jefferson's, Kirke's, Pond's Seedling, and Coe's Golden Drop being very fine, as were also Victoria, Magnum Bonum, Diamond, &c. I may state we have had quite a plague of wasps here this season, attacking plums, &c., long before they were fit for gathering.—Thomas Bradshaw, *Hillsborough Castle Gardens.*

—— Plums have heavy crops on wall trees; Victoria, Early Green Gage, Coe's Golden Drop, Denniston's Superb, Jefferson, and White Magnum Bonum were all severely thinned directly the fruit was set, an operation which well repays the time spent; result, extra fine fruit both in size and weight. Damsons a failure.—J. Leicester, *Seaforde Gardens, Clough.*

County Meath.—Among plums Victorias were very good, this being one of the best. Green Gages had a fair crop; quality very good.—James Hounslow, *Headfort Gardens.*

Denbighshire.—Plums have been almost a failure, though I never saw the trees so full of blossom, but when in bloom we had a severe hailstorm, which did great damage, and only where the trees are situated in a sheltered position is there fruit to be found. Victorias were fairly good, in fact it is the only variety bearing anything like a crop.—H. Forder, *Ruthin Castle Gardens.*

Derby.—Plums were the poorest we have had for many years. Of the many varieties that are grown here none carried a full crop, and, curiously, the best varieties cropped the best, such as Golden Drop, Jefferson, Kirke's, and some of the newer varieties were very fairly loaded, such as Monarch, Archduke, Grand Duke, and Czar.—J. H. Goodacre, *Elvaston Castle Gardens.*

Dublin.—Our plum crop is light and poor. Green Gage is the only variety that came near an average. The trees have been badly infested with aphis. The following are some of the sorts that do well here as a rule: Green Gage, Purple Gage, Denyer's Victoria, Magnum Bonum, Kirke's, Orleans, Jefferson, and Coe's Golden Drop. In some favoured districts the crop is good, but as a whole it is partial and disappointing. Damsons are a failure.—G. Smith, *Vice-Regal Gardens, Dublin.*

Dumfriesshire.—Among plums Victoria is the best cropper by far; the others grown are Orleans, Jefferson, Caledonia, Green Gage, Magnum Bonum, Kirke's, and Golden Drop, but Victoria, Caledonia, and Magnum Bonum are the only bearers this season. The first two are grown as espaliers and the latter on a wall.—John Urquhart, *Hoddom Castle Gardens.*

Dunbar.—The most productive kinds of plums here are Victoria, Pond's Seedling, Jefferson, and Washington. Green Gages are quite a failure, owing to the very cold winds we experienced during the time they were in bloom.—George Taylor, *Broxmouth Park Gardens.*

Durham.—All the following varieties of plums have done well, considering the very dry season we have had: McLaughlin's Gage, Kirke's, Brahy's Green Gage, Washington, Bryanston Green Gage, Transparent Gage, Lawson's Golden Gage, Green Gage, Jefferson, Victoria, Magnum Bonum, Diamond, Prince Englebert, Orleans, Coe's Golden Drop, Duke of Edinburgh, Pond's Seedling, Purple Gage, and Grand Duke.—James Tullett, *Raby Castle Gardens.*

Fifeshire.—Kirke's Seedling and Washington are the only plums of which we had a crop this season, and they were below an average.—John Clark, *Wemyss Castle Gardens.*

Forfarshire.—Plums, both as wall trees and standards, generally do well here, but this year are rather a thin crop. Victoria, Jefferson, Kirke's, Prince of Wales, and Coe's Golden Drop are those most grown and the best croppers.—Thomas Wilson, *Glamis Castle Gardens.*

Glamorganshire.—Plums are all but a complete failure in this district. The trees flowered freely, but the fruit did not set, and the foliage suffered from the attacks of green aphis beyond anything I have ever seen before. Bryanston Gage is the only variety in the open quarters that has anything like a crop. Victoria, which is usually a grand cropper, has completely failed in the open quarters this year. I have a good many trees growing by the sides of walks, and not one has borne a fruit, and there is not more than half a crop on the wall trees. The crops of Coe's Golden Drop, Kirke's Seedling, Transparent Gage, and other varieties are very poor indeed, and I am afraid the trees will not do much next year.—A. Pettigrew, *Cardiff Castle Gardens.*

Gloucestershire.—Among plums Victoria has done well, some of the fruit being very large. Kirke's, Coe's Golden Drop, and Jefferson are good, but as a whole it is a poor plum season here.—John Aplin, *Hasfield Court Gardens.*

Hampshire.—Plums on walls have been a poor crop this season. Our best are Yellow and Red Magnum Bonum, Rivers' Early Prolific, Oullin's Golden Gage, Denniston's Superb, Kirke's, Victoria, Jefferson, Pond's Seedling, Coe's Golden Drop, Monarch, Golden Transparent, Grand Duke. On standard trees Victoria was the best. Damsons were poor in quality and crop.—J. W. McHattie, *Strathfieldsaye Gardens.*

—— Plums are a good crop, and may be said to be above the average; but the fruit is being devoured wholesale by wasps and bees. The latter are more troublesome than wasps and flies, and, as we have about eighteen bar-frame hives in the garden, we find them just now very destructive. Our best culinary varieties are Early Rivers, Victoria, Pond's Seedling, Green Gages, and Diamond. The best dessert varieties are Kirke's, Green Gage, Transparent Gage, Jefferson, and Golden Drop.—G. Trinder, *Dogmersfield Gardens.*

King's County.—Plums have borne well, and the heaviest croppers were Blue Impératrice, Orleans, Victoria—this never fails—Pond's Seedling, extra good; Prince of Wales, Magnum Bonum, Green Gage, Reine Claude de Bavay, and Grand Duke.—R. McKenna, *Charleville Gardens.*

Kirkcudbrightshire.—The plum crop was very poor. Blue Impératrice, Early Orleans, Kirke's, Victoria, and White Magnum Bonum are the varieties that do best here.—J. Hannah, *Cairnsmore Gardens.*

Monmouth.—Plums are under an average crop, the only variety that is heavily cropped being Victoria. The varieties that have light crops are Rivers' Early Prolific, Pond's Seedling, The Czar, Jefferson, Kirke's, Early Transparent, and Monarch. The latter is a valuable late plum, as is also Grand Duke, which generally bears well. The above are grown with several other varieties as bush trees. We have very poor crops upon walls; the wall trees, however, are placed in a position considerably lower than are the bush trees.—Thomas Coomber, *The Hendre Gardens.*

Montgomeryshire.—Plums are a very thin crop; but the best are Victoria, Transparent Gage, Brahey's Gage, Diamond, Early Rivers, Magnum Bonum, and Jefferson.—John Lambert, *Powis Castle Gardens.*

Norfolk.—Plums are a very partial crop in some gardens in this neighbourhood. There is a fair crop of Rivers' Early Prolific, Czar, Pond's, Goliath, Coe's Golden Drop; other kinds, like Victoria, Belgian Purple, that seldom fail, are very poor indeed. All trees are suffering from the dryness of the subsoil. Damsons and bullaces are a poor, light crop.—W. Allan, *Gunton Park Gardens.*

Northamptonshire.—The following varieties of plums are particularly good on walls: Angelina Burdett, De Montfort, Impératrice, Reine Claude de Bavay, Goliath, Magnum Bonum, Jefferson's, Coe's Golden Drop, and Victoria. On standards Pond's Seedling, Early Orleans, and Victoria are the best, but far below the average. Damsons are a failure throughout.—John Hayes, *Castle Ashby Gardens.*

Northumberland.—Plums are much more certain on the walls than as standard trees in the open. The latter were a failure this year. We had good crops of Jefferson and Victoria; also some good Kirke's and Coe's Golden Drop, with Oullin's Golden Gage as a first early dessert, which is very good; Lawson's Gage and Green Gage are also worth planting. Prince Englebert is good on walls, and so are many other varieties; but we are satisfied to plant the few that will serve from first to last, and that the best kinds, because wall space is limited. I am told the Orleans is good. The Czar should be planted on walls and in the open. As orchard trees heavy crops are obtained in favourable seasons. Victoria is the greatest cropper; Pershore a great crop, but poor flavour, Cox's Emperor, Czar, Monarch, and Wyedale are good. The last three are on trial in the open on standard, with many others.—G. Harris, *Alnwick Castle Gardens.*

Queen's County.—Plums have been very poor, and the trees have been very much blighted. Pond's Seedling and Nectarine plums are the only two varieties that carried a crop. The first-named seems to do very well here, and we can generally rely upon a few fruits every season from it. White Magnum Bonum, Washington, Victoria, Reine Claude de Bavay, Jefferson's Green Gage, and Coe's Golden Drop, although a mass of bloom, produced no fruit.—W. Begbie, *Emo Park Gardens.*

Radnorshire.—Green Gages, Victorias, and Kirke's, also Pond's Seedling, carried good crops on west wall; but standards were a complete failure, owing to the late frosts in the spring.—W. Palliser, *Norton Manor Gardens.*

Rutland.—Early Prolific (Rivers'), The Czar, Kirke's, Victoria, Pond's Seedling, and Coe's Golden Drop carried good crops on walls. The standard trees had very few fruits this year.—W. H. Divers, *Belvoir Castle Gardens.*

Shropshire.—Plums, on the whole, are decidedly under an average crop, but they are of fine quality. Prince of Wales, Kirke's Black, Jefferson, and Dancer's Seedling are fairly well cropped, but others are very thin. Damsons—the cottager's friend—are also very much under the average but of fair quality.—James Louden, *The Quinta Gardens.*

Somerset.—Victoria has a heavy crop on walls facing west, as fruits were well covered in spring with fine net. Kirke's is a medium crop, nicely coloured; Coe's Golden Drop, medium; Jefferson, medium; Brahy's Green Gage, medium; Reine Claude de Bavay, medium.—W. H. Miles, *Dillington Park Gardens.*

Staffordshire.—Plums have been almost a total failure this season, with the exception of the trees growing against walls, which have perfected a fair crop, while pyramids and standards were completely denuded of embryo fruits and blossom by frosts and cold snowstorms. Plums of all kinds seem to thrive well in this neighbourhood. We have over 30 varieties, all of which are very satisfactory. Denyer's Victoria, Jefferson, and a local variety called Dovebank are the sorts that are grown by the cottagers.—George Woodgate, *Rolleston Hall Gardens.*

Surrey.—I had a good crop of the following plums on walls, but trees in the open were spoiled by late frost. Bryanston Gage, Denniston's Superb, Lawson's Golden Gage, Guthrie's Late, Kirke's, Coe's Golden Drop, Rivers' Prolific, Magnum Bonum, Jefferson. For bearing heavy crops Rivers' Prolific is the best of the varieties I grow.—W. Higgs, *Fetcham Park Gardens.*

Sussex.—Plums have been a peculiar crop this season, as some varieties have borne such crops that the trees were broken down with the weight of the fruit. Of standards or bushes the following have been the most prolific: Early Rivers, Washington, White Magnum Bonum, The Czar, Bush, Prince of Wales, Victoria, Reine Claude Violette, Pond's Seedling, Cox's Emperor, Lawrence Gage, Stint, Monarch, Wyedale, and Diamond. On walls green gages: Coe's Golden Drop, Purple Gage, Kirke's, Blue Impératrice, Imperial de Milan, Stint, and Transparent are amongst the best, though many other varieties had a fair crop. Of damsons Frogmore Prolific is the best with us this season, though in the neighbourhood Prolific is not much grown, the Cluster being the favourite, and this has a fair crop.—H. C. PRINSEP, *Buxted Park Gardens.*

Sutherland.—Rivers' Early Prolific bore an excellent crop, small and early; Oullin's Golden Gage, moderate crop; Lawson's Golden Gage, moderate crop of good quality; Victoria, heavy crop, required thinning. The plum crop was much under average on the whole—D. MELVILLE, *Dunrobin Castle Gardens.*

Wigtonshire.—Plums have turned out much better than was expected some time ago, and very good crops of the following are now ripe or ripening: Czar, Early Rivers, Jefferson, Kirke's, Lawson's Golden Gage, Denniston's Superb, Transparent Gage, Victoria, Pond's Seedling, Magnum Bonum, and Goliath; these are growing against walls. Very good crops of Victoria and Belle de Septembre are now being gathered from bush and standard trees.—J. DAY, *Galloway House Gardens.*

Worcestershire.—Plums with us have been an excellent crop, and the fruit of good quality throughout. Although wall trees were in flower at the time of the blizzard, I never saw fruit set more thickly, and, moreover, had to be heavily thinned. The weather was dry, which must have made the difference, as a few later varieties, which were in flower a little later, with the weather much milder but moist, the set was poor. Jefferson has been grand, whether the trees were on south, east, west, or north walls, or even in the open. Kirke's, Coe's Golden Drop, Orleans, Rivers' Prolific, Victoria, Pond's Seedling, Pershore, the latter, although a common plum, still the best for bottling. Oullin's Golden Green Gage, Belle de Septembre, The Czar, Monarch (now carrying heavy crop). For trees to bear freely, either on walls or the open, lay in young growth the whole length, wherever there is room, when fruit buds will form the whole length. —A. YOUNG, *Witley Court Gardens.*

Yorkshire.—Plums are a very thin crop indeed. As with apple trees there was an abundant blossom on most kinds. The Green Gage family were the exception to this. Victoria, which in the North generally does so well, is this year nearly fruitless; they did not bear well last year either. The trees generally were much pestered with green fly in the early part of the summer, both on walls and in the open. Still, on the whole, they look fairly promising now, and probably next year will be a plum year, and much lower prices for the fruits. Taking one each of light and dark plums for this part and for dessert use, Jefferson and Kirke's bear the palm. Coe's Golden Drop in this district is not fit for dessert one year in seven. Winesours are grown to a great extent within a few miles of us. About Sherburn there are large orchards of this plum, the fruits from which are said to have a better flavour than usual. At any rate, the growers have seldom or never any difficulty in disposing of their fruit at fairly good prices. I have known epicures give 15s. per stone of 18 lb. for them—H. J. CLAYTON, *Grimston Park Gardens.*

—— Plums have been under the average. The best crops are of Kirke's, Coe's Golden Drop, Pond's Seedling, Victoria, and Magnum Bonum.—J. ALLSOP, *Dalton Hall Gardens.*

Nymphæa stellata.—This variety is grown in one of the open groves at Sandhurst Lodge, Berks, but under the name of N. capensis. The plant I saw there recently was not so strong as the one at Gunnersbury House, having been more recently introduced. At Sandhurst Lodge it is planted into a broad, deep pan filled with good loamy soil and decayed manure; then kept in a warm pit all the winter, is taken out, dropped into the warmest of the several groves in the month of June, and is lifted and returned to its winter quarters in October. When I saw the plant a few weeks since it was blooming well, and, as the flowers stood up from the water fully twelve inches, was very distinct from the general stock of nymphæas. Some beautiful tropical forms are grown also plunged in pans in tanks placed under a south wall and heated by pipes. I like this species for the reason especially that it carries its blooms high, because not a few of the ordinary strong growers amongst water lilies produce such an excess of leaves that the blooms, because they sit on the surface of the water, are rather hidden. Some regulation of the soil bed of the pond seems needful, as such rank growers need less encouragement, whilst the weaker growers that are so much better near the margins rather appreciate it. It is true that the flowers of N. stellata are light and smaller than are those of the ordinary nymphæas, and for that reason they have less need of the sustaining support of the water. Still blooms well thrown above the leafage have great merit. We cannot too warmly thank the introducer of these lilies for having been so instrumental in adding another and a singularly beautiful charm to our gardens. No one in England has done more in this direction than has Mr. Hudson.—A. D.

Koelreuteria paniculata.—Although June and July is the proper period for this hardy Chinese tree to flower, I was surprised to find a few days ago a considerable number still in bloom. It is an old inhabitant of gardens, having been introduced from China in 1763, but as yet is by no means common in cultivation. It is very ornamental either in or out of flower, as its leaves are attractive. It forms a small tree scarcely ever exceeding fifteen feet in height, while its style of growth is irregular. The leaves are deciduous alternate, imparipinnate in shape, deeply serrated on the margins, and deep green in colour. The flowers, which are deep yellow, with a striking crimson centre, are borne in terminal panicles, succeeded later by large bladdery capsules, which renders it very conspicuous in late autumn. Its culture is of the easiest, as it grows freely in any good garden soil, but flowers better if planted in a sheltered position. Propagation is effected by cuttings of the young shoots in spring, or by layers in autumn as well as by seeds sown in spring. Its handsome appearance when growing and free-flowering qualities, combined with its easy culture, should lead to it finding a place in every collection of hardy trees and shrubs. Koelreuteria bipinnata is a distinct species from the mountain regions of Yunnan, which as yet is scarcely ever seen outside nurseries and botanic gardens, although deserving of cultivation. It is of recent introduction, having been introduced to this country in 1888. The leaves differ from that of K. paniculata in being bipinnate, while its flowers are of a brighter shade of yellow. Some authorities regard this as only a variety of K. paniculata, but a description in *Revue Horticole* of 1888, p. 393, fig. 93, seems to justify our regarding it as a species.—E. S., *Woking.*

SNOWFLAKES.

ONE of the most satisfactory and interesting phases of modern gardening is the return to the natural as distinct from the formal. This is greatly evidenced by the growing tendency to plant hardy bulbs in grass amongst shrubs, beside woodland walks, in the orchard and "wilderness," in fact in every quarter where early mowing is not compulsory. The flowers springing from their verdant setting produce a charming effect, while such culture adds considerably to the available breadths of flowers for cutting, and last, but by no means least, it permits the maturing and ripening of the bulbs undisturbed and the foliage unmutilated until its particular work has been performed. Amongst the most suitable subjects for naturalisation the leucojums, or snowflakes, stand pre-eminent. Considering the attributes of this genus it has hitherto been a somewhat neglected one, though there is an inclination on the part of many to now accord it a more prominent place.

With the exception of some few of recent introduction the leucojums are perfectly hardy and non-exacting in their requirements as regards soil, &c., provided the situation be not too dry. Though, perhaps, somewhat seldom met with in a wild state, two species are indigenous, their habitat being moist meadows and shady places, as noted by Curtis in his "Flora Londinensis" (1798). The bulbs may be planted in clumps, three or four inches deep, in grass, or rather deeper in any ordinary garden soil, from September to November, and will require no further care except an occasional lifting and dividing when at rest. A few bulbs should be potted annually in good soil for blooming in the cool house, for if brought on gradually, and plentifully supplied with water during the most active period of growth, all the snowflakes are excellent for pot culture.

The following are placed somewhat in the order of flowering: Leucojum vernum (the Spring Snowflake), flowers white, tipped with green; very sweet-scented, and early, as the name implies; one of the most beautiful and best known. L. v. carpathicum, a strong-growing variety of the preceding; white, yellow spotted; very fine. These bloom in February and onwards. L. roseum has most elegant, rose-coloured flowers. L. æstivum is the well-known Summer Snowflake, but the specific appellation is somewhat a misnomer, as the flowers are produced during April and May. They are pure white, and drooping. L. pulchellum (Hernandezi), like the last named, is a strong grower, attaining a height of eighteen inches, with flowers of a similar colour and form, greatly prized for cutting; May blooming. L. autumnale is the Ladies' Snowflake; a dwarf species, flowers white, pink-tipped and veined. It flowers in August and September, and is very suitable for the rock garden. Mention may also be made of L. trichophyllum, which resembles the latter in its flowers, being pink and white, and sometimes pure white. It is a spring-flowering species, and, along with the recent introductions from Andalusia, should be grown in moist and very sandy soil.

The leucojums possess another recommendation almost stronger than their gracefulness and purity of flowers, and that is their fragrance, which resembles the delicate odour of the violet, whence the generic name—from two Greek words signifying "white violet"—though, as a matter of fact, the Snowflakes remind us much more powerfully of the snowdrops, differing from the latter only in the form of the perianth, the segments being of equal size in the former, and alternately even in the latter, besides a slight structural difference in the opening of the anthers.

Ripon. F. DIXON.

STEPHANOTIS FLORIBUNDA IN COOL HOUSES.

IT is sometimes found that certain exotic plants which come from hot countries, and are regarded here as stove subjects, will thrive in a temperature considerably below that usually afforded to the occupants of highly heated houses.

One of these is the Stephanotis floribunda, a plant which, when in bloom, is greatly admired by most persons, but one which is often passed over owing to the fear that it will only succeed where plenty of heat and moisture are at command, whereas, by a little careful treatment by way of watering during the coldest part of the year, it may be successfully cultivated in an ordinary plant house, where the temperature is not allowed to fall below 40 degrees for any length of time during severe weather.

At the recent show at Edinburgh, Mr. Lunt, Keir Gardens, gained the premier award in the flowering plant class with a well-grown and profusely flowered specimen of the above. This was trained upon a balloon trellis, about thirty inches in diameter, and although larger plants of the kind have occasionally been seen at this show, it is very doubtful whether one with healthier foliage, finer trusses, or larger individual flowers has been seen there. This plant has been grown for some years in a house that contains a varied collection of plants, useful for decoration or cutting, and at present consisting principally of geraniums, begonias, cannas, and a very fine plant trained upon the roof of Lapageria rosea, which has several hundreds of blooms now open, this showing that the temperature maintained must be very moderate. On mentioning this fact to Mr. Lunt, he stated that the house was ventilated at all times to suit the requirements of whatever class of flowering plants might be in season, with a view to prolong the flowering of the same as long as possible, and that the thermometer had been known to fall as low as 27 degrees, but no harm had ever resulted to the stephanotis.

To accomplish the cultivation of this plant successfully in a cool house water must be given very sparingly in the winter season, or when the plant is at rest, and a position should be provided where it may receive a considerable amount of sunlight to ripen its growth, which, compared with that made in much heat, will be stout and short-jointed, with large and deeply coloured leaves. The flowers also will last much longer upon the plant, which may be used for house or conservatory decoration if required, without the risk of damage, by being removed to a cooler atmosphere than that in which it has grown.

Galloway House Gardens, N.B. JAMES DAY.

WORK FOR THE WEEK.

WARM ORCHIDS.

LÆLIA PERRINI will now be commencing to flower; its segments and labellum are rather narrow, otherwise it is a very beautiful orchid, and one that is very welcome, flowering as it does at the same time as Cattleya labiata autumnalis, C. aurea, &c.; other points in its favour are its ease of culture and its longevity. Anyone who can grow orchids at all can be successful with this; it thrives well with the cattleyas if allowed plenty of water while in a growing state, and removed to the cool end of the house when resting, the water being gradually diminished until sufficient only is allowed to keep the bulbs in a plump state until growth commences. Lælia Perrini nivea, which is almost white, requires exactly the same treatment. Both the species and its variety require to be kept in a dry atmosphere while flowering, otherwise the damp will affect the flowers.

Dendrobium album is another late flowering subject that is very welcome, for its beautiful ivory-like flowers, associated in the flowering house with brighter colours, gives a very pleasing effect; a good specimen well-flowered is very pretty, as, unlike many of the dendrobiums, it flowers on the pseudo-bulbs still carrying green leaves, which enhances its beauty. This orchid must be grown in the dendrobium house, in a compost of rough peat and sphagnum, in pans or baskets suspended from the roof, and when resting, must have a few degrees more warmth than the vinery affords. Dendrobium chrysanthum is another of the same type, but will have about finished flowering; this is very easy of cultivation, enjoying abundance of water during its growing season, and occasional waterings of liquid manure; this also thrives well under basket culture in a compost of rough peat and sphagnum and should be suspended from the roof; some growers are successful with it in a cool house. Schomburgkias will have mostly finished their growth, and in order to prepare them for flowering they will require to be removed to a cooler house and placed as close as convenient to the glass.

Galeandra Devoniana is a charming orchid and well worth growing for its beauty, but like many others it is very difficult to grow successfully. and has now become scarce; this enjoys plenty of heat and a good supply of water while growing; it is a victim to red spider and thrip, and requires to be syringed. Now it has finished flowering it must be removed to cooler quarters for the resting season; teak wood baskets or pans suspended from the roof suit it well. The shading now on the warm houses is not necessary, except in the case of phalænopsis. Guard against excessive moisture and too high a temperature; keep all bottom ventilators open when convenient, only closing them against very cold winds; the top ventilators should be opened when the weather is favourable.—T. STAFFORD, *Tyntesfield Gardens.*

STOVE PLANTS.

THE stock of panax may be rapidly increased now, and should this be desired the stems may be cut into pieces from one to one and a-half inches long, pressed into pots of sandy soil and plunged in the propagating case, where they will not be long before they form roots and break into growth. The roots also may be cut into lengths and served in the same way, and with a little careful attention to potting on as required will soon produce useful plants. Specimens of Dracæna gracilis which have become bare at the base should have the top removed and inserted as a cutting, and the old stem be stood in the propagating house, where it will soon push forth young shoots from the latent eyes; these, when about four inches long, should be removed with a heel and inserted in thumb pots of sandy soil and plunged in bottom heat, where they will soon root without the loss of a leaf. Old stools of dracænas will throw out young growths more freely if laid on their side instead of being stood upright. Continue to put in a few cuttings of crotons occasionally to supply the place of those suffering injury from frequent use indoors. A few small suckers of Pandanus Veitchi also should be put in from time to time; highly-coloured plants of this are very susceptible to damp, also to injury in rooms, therefore it is necessary to have young plants in various stages always ready to take their place. Keep up a regular supply of panicum, tradescantia, and Pilea muscosa, as these are useful for house and table decorations, and the season is at hand when ladies generally say, "We cannot get to the gardens often, so we must have the gardens in the house." A few plants of epiphyllum should be now placed in the stove to bring them into flower; when the flowers expand keep moisture from them or they will soon be ruined; when fully in flower gradually harden and place in the conservatory, but be careful not to over-water.

Stove plants still in active growth should be afforded positions at the warmest end of the house, while those which have completed growth and are approaching their season of rest may be placed at the cooler end; these latter will require less water than formerly, yet they must not be neglected, but have their wants met with the same care as given during the season of growth. Success would more frequently attend the efforts of the cultivator were he to give closer attention to plants during their season of rest than they generally receive. Eucharis are growing freely and should receive a little stimulant occasionally; an application of soot water once a week will be to their advantage. We give our plants a watering once a month with lime water, and I find they are the better for it; we never rest eucharis, yet they flower freely, and though mite is not altogether absent it never causes us any inconvenience, the foliage being strong and healthy; we have our most abundant show of spikes during December and the early part of January, when, of course, they are most useful. Continue to dry off caladiums, achimenes, and gloxinias, but do not withhold water from them suddenly. A few of the earliest-rested tubers of gloxinias may now be started for affording a supply of flowers early in the year, when they will be greatly valued. Palms should receive stimulants regularly—soot water alternated with some good artificial fertilizer will supply their wants admirably; keep the fronds clean by an occasional sponging. Keep decaying fronds regularly removed from ferns, and have the watering of these attended to in the morning so that the moisture may dry up before evening. The night temperature of the stove should now range from 65 degrees on cold nights to 70 degrees on mild ones; day temperature five degrees higher from fire heat; the intermediate house 60 degrees at night and 65 by day.—J. TUNNINGTON, *Ripley Castle Gardens.*

THE FLOWER GARDEN.

THE time has now arrived when dahlia roots should be lifted and stored for the winter. A dry day should be chosen for this operation when the borders may be trodden on without fear of carrying the soil on to the paths. The tops should be cut away to within six or eight inches of the ground, and when lifted and the earth shook away, the labels must be securely fastend to the roots and not the stems, which may drop off eventually, with tarred string or thin wire. If convenience admits, the roots may be temporarily housed in some open shed or frames and laid over on their sides to allow moisture to dry out of the stems, and the stools afterwards stored for the winter in any cool place from which frost is just excluded. Choice varieties should be placed together, each variety in a box, and given a little extra attention during their time of rest. Roots of Marvel of Peru, cannas, Salvia patens, hedychiums, &c., may be stored in somewhat the same way, removing the tops partially at first. If not already done any old plants of pelargoniums or other bedders it may be necessary to save from the beds should be potted up into the smallest sized pots the roots may be conveniently placed in and stood out of the reach of frost, keeping the soil rather dry. Pelargoniums potted up at this date should not be cut back because of the liability to decay, therefore select plants that may be potted up intact, simply clearing off leaves and flower buds. These old plants are useful for filling the centres of beds the following year and for providing cuttings in spring if required. Tender plants of all kinds should be housed forthwith where this has not already been done.

The summer bedding plants, even if not injured by frost, will by this be somewhat unsightly, and may now be cleared away, especially where the beds are replanted with spring flowering subjects. Where this is practised the beds should be at once dug, first spreading a slight dressing of rotten manure on the surface, and put in order to receive the spring flowering plants, as the earlier now planted the better chances they have of becoming established before winter. Summer bedding violas may, if desired, remain in the beds, where they will usually flower profusely in spring. The old flowering growths should be trimmed off and the surface of the beds between the plants slightly loosened up, and if other subjects, as variegated pelargoniums and others have been associated, spring flowering ones may now be substituted. Myosotis dissitiflora, or the blue nemophila, may be mixed with white violas; or Myosotis sylvatica alba, yellow wallflowers or white hyacinths may be associated with violas of blue or purple shades. Pansies and violas prepared during the past month or two will also now be ready for planting and should be in their winter quarters during the present month, if possible, the weather later being very uncertain. For the same reason bulbs of hyacinths, tulips, and various daffodils should also now be planted. The beds for these bulbs should be prepared as for other bedding plants. Hyacinth and tulip bulbs may be planted with a rather bluntly pointed dibber, making the holes for the bulbs about four inches in depth at a distance of six to eight inches apart each way. A little sand may be scattered over the surface to work in with the bulbs when planted, although this is unnecessary where the soil is of a light nature. In herbaceous borders the principal flowering subjects now, excepting chrysanthemums, are the perennial asters or Michaelmas daisies, which, notwithstanding the drought, have made a brave display the past few weeks. More attention has been devoted to these of late years, and several good varieties added to the list. Seedlings are also easily raised (the seeds should be saved now) and in this way a great variety in colour and habit may be obtained with very little trouble; by sowing under glass in spring plants may be flowered the first year.—C. HERRIN, *Dropmore.*

HARDY FRUITS.

THE audit of the recent great fruit show will do much to inform growers what are the most appreciated varieties of fruit, and at this season intending planters will do well to note that Cox's Orange Pippin heads the list. In my last note I touched upon the importance of selecting trees at this season, and also of lifting to get good wood. The latter work must be yet deferred in this part of the country, for we have not had enough moisture to make lifting at all safe. Of course, when thorough soakings of water can be given it alters the condition of things, but I fear in few cases there is not enough labour at command to do this. Peaches this year have been good, both in crop and quality, indeed I never remember a better season as regards the quality; any trees that dropped their fruits badly early in the year will now be making more growth, and it will be well to see that the new wood, unless needed, does not prevent the older wood ripening. It may not be out of place to give the names of a dozen of our best peaches, some of the best nectarines, and other hardy fruits, but, of course, soils greatly influence variety; ours is a very light soil on gravel. The varieties named, however, are mostly reliable, and my list may be useful to younger fruit growers. I will place them in their order of ripening. My earliest peach is Waterloo; Amsden's June follows, and is equally reliable, as is Hale's Early, Early Grosse Mignonne, Early Silver, Royal George, Crimson Galande, Dymond, Sea Eagle, Nectarine Peach, Late Devonian, and Princess of Wales; these provide fruit from early July to the end of September, and of high quality. Nectarines are less numerous, and unless the season be a favourable one the late kinds do not always ripen. Our earliest is the Early Rivers, a splendid fruit, and, what is better, it so far has never failed to give a good crop with us; Lord Napier is our next and best; Rivers' Orange, Newton, Humboldt, and Pineapple follow in order as named. There are other nectarines, but these we find most reliable; on the other hand, many find Elruge and Dryden excellent for open walls.

Apricots do not thrive everywhere, but they are delicious fruit and well repay good culture. Breda is reliable with us, as is Shipley or Blenheim and Hemskirke; none beats the Moorpark, but it is not a good grower, the best as regards growth being Large Early; the same remarks concerning the soil apply to apricots as to cherries. Plums are so numerous that it may not be necessary to give varieties, seeing so much depends on how they are grown; for instance, the Victoria and cooking kinds do well in standard or dwarf bush forms; Rivers' Early Prolific, Diamond, Pond's Seedling, Victoria, Prince of Wales, Prince Englebert, Sultan, Pershore (Magnum Bonum), Monarch, and Grand Duke are our best croppers. For dessert Transparent Early Gage, Green Gage, Denniston's Superb, Ickworth Impératrice, Jefferson, Kirke's, Lawson's Golden, Bryanston Gage, Coe's Golden Drop, Reine Claude de Bavay, Purple Gage, and Late Transparent Gage are first-rate, but many of them should have wall shelter. Pears will need attention, and here intending planters will find the greater difficulty in selection. I fear in some cases size is preferred to quality, and readers will note that in the audit the large Pitmaston Duchess heads the list; this is a valuable pear for size, but lacks high quality. I am glad to see, however, Doyenne du Comice take so high a position, and no one will make a mistake in planting this, for it is one of the very best autumn pears grown and one that never lacks flavour. Louis Bonne of Jersey is good, for it is a free cropper and the quality is fine. An excellent early pear is the Fondante d'Automne, and in light soil Gratioli of Jersey is very useful; Williams' Bon Chrétien does well in bush or standard form; Thomson's does not do well in all soils, but on a wall it is fine, as is Marie Louise, and one cannot well omit Pitmaston Duchess, Durondeau, Beurré Diel, Beurré Hardy, Brown Beurré, and Beurré Baltel père, and though Winter Nelis lacks size it is of grand quality. For late supplies Easter Beurré, Nouvelle Fulvie, and Josephine de Malines are our best, but the new Le Lectier promises well. All collections of apples should include Cox's Orange, Ribston Pippin, Worcester Pearmain, and Duchess of Gloucester for first supplies; Lady Sudeley, Wealthy, Blenheim Pippin, King of Pippins, Peasgood's Nonsuch, all the best russets in variety, Claygate Pearmain, Reinette du Canada, D'Arcy Spice, when it succeeds, and Sturmer Pippin; whilst for cooking there are the Keswick and Manks' Codlins, always free bearers, Cellini, Warner's King, Golden Spire, Golden Noble, Bismarck, Beauty of Kent, Dumelow's Seedling, Lane's Prince Albert, Newton Wonder, Alfriston, Northern Greening, Sandringham, Bramley's Seedling, and Norfolk Beaufin. Of course others could be added.—G. WYTHES, *Syon Gardens.*

EXHIBITIONS AND MEETINGS.

FRUIT AND VEGETABLE SHOW AT LIVERPOOL, October 15.

IN connexion with the Liverpool Farmers' Club an' interesting and important exhibition was held in a large marquee near the North Haymarket on October 15, and judging from the exhibits and visitors it promises to fully maintain its position as one of the leading root shows in the North. The number of exhibitors shows an increase of two and entries 11; the total for this year being 172 and 1,062 respectively. The majority of the classes are for fruit and vegetables, which makes it interesting to the gardener. In this section potatos play a prominent part, considerably over 500 dishes in 35 classes being entered. Space will not permit to give the full list, so the first prize winners will be given excepting in the new varieties of potatos, when all three will be stated. Except in special classes six tubers were the number staged.

White early kidney, Mr. J. Halsall, Burscough, with Early Eclipse; Sutton's Early Regents, Mr. Edward Tinsley, Ormskirk (extra clean); early round, Mr. Peter Davies, Warburton, Cheshire, with Harbinger; second early kidneys, Mr. E. Tinsley, with Twist's Perfection; second early round, Mr. James Johnson, Scarisbrick, with White Perfection; second early, any other shape, Mr. James Johnson with Sutton's Seedling, Snowdrop, or Lord of the Isle; Mr. James Johnson with Satisfaction (good form); Lymm Grey, Mr. John Halsall; Reading Giant, Mr. Thomas Alty, with clean, smooth tubers, 17 entries; Satisfaction, Mr. B. B. Raymond, Ludlow, Salop, with a grand dish; Up-to-Date or General Roberts, Mr. Thomas Alty, with large tubers of the former, 32 entries; late main crop Mr. Edward Tinsley. 27 entries; Bruce, Mr. James Johnson; Fidler's Colossal, Mr. Thomas Alty; Farmer's Glory, Mr. Thomas Rimmer, Ormskirk; kidney, any other variety, Mr. James Johnson, with beautiful forms of Woodstock; late round, any other variety, Mr. Peter Davies, with Saxon's; late, any other shape, Mr. G. Ashley, Manchester, with Zion House; red or coloured, early or second early Kidney, Mr. John R. Newton, Warrington, with Peerless Rose; red or coloured, early or second early round, Mr. G. H. Colin, Ludlow, with Vicar of Laleham; red or coloured late, other than rounds, Mr. B. Bowen, Ludlow, with Edgecote Purple; red or coloured, late round, Mr. B. B. Raymond, with Vicar of Laleham; for the heaviest old or new variety, Mr. James Gordon, Holmes Chapel, Cheshire, scored with British Queen, the heaviest tuber scaling over two and a-half pounds.

NEW VARIETIES.—Early or second early Kidney, Mr. Edwin Clarke, Heatley, with Challenge; Mr. E. W. Turton, Hale, with Prime Minister; Mr. P. Davies, with Reliance: nineteen entries. Early or second early round, Mr. B. Ashton, Ormskirk, with Carter's Reliance; Mr. J. Halsall, with Daniel's Norwich; Mr. James Johnson, with Lancashire Hero. Late Kidney, or any other shape than round, Mr. J. R. Newton, with Webb's Motor; and Mr. P. Davies, with Syon House Prolific. Late, round, Mr. Thomas Almond Maghull, with Seedling Model; Mr. J. Johnson, with Mona's Pride; and Mr. E. Clarke, with Syon House Prolific. Three dishes, prizes presented by Messrs. Sutton and Sons, Reading, Mr. B. Bowen, with Satisfaction, Seedling, and Windsor Castle. Single dish, nine tubers, prizes presented by Messrs. Sutton and Sons, Mr. B. B. Raymond staged the premier lot, having fine tubers of Satisfaction. Kidney, or any other shape except round, unwashed, prizes presented by Mr. W. L. Hutton, Ormskirk, Mr. T. Critchley, Halewood, with Fidler's Queen; Mr. J. S. Gordon, with Scottish Triumph; Mr. Thomas Rimmer, with The Union. Round, six tubers, prizes presented by Mr. William Kerr, Dumfries, Mr. Joseph Draper, Lathom, with Fidler's Prize Winner; Mr. T. Rimmer, with King of Norway; Mr. T. Kerr, with The Sirdar. Special class, prizes presented by Mr. W. Kerr, Dumfries, Mr. J. Johnson, with a grand lot of General Roberts; Mr. R. Shepherd, same variety; Mr. G. Ashley, third, with Cigarette. For three distinct varieties, seven tubers each, prizes presented by Messrs. Fidler and Sons, Reading, Mr. G. Ashley scored, with Queen, Giant, and Prizewinner.

In the vegetable classes the chief awards were: Turnips, six white, table, Mr. C. Warburton, Timperly. Cabbages, two red, Mr. G. Ashley, with Monsters. Brussels sprouts, two sticks, Mr. C. Warburton. Cauliflowers, two, Mr. C. Warburton, with splendid heads. Celery, three heads, white, Mr. James Johnson. Celery, three heads, red or pink, Mr. G. Taylor, Southport. Celery, three heads, Fidler's Prizewinner, prizes presented by Messrs. Fidler and Sons, Reading, Mr. J. Johnson. Celery was well shown in all classes. Carrots, six long, Mr. W. Shepherd, with large roots. Carrots, six intermediate, Mr. B. Ashton, clean roots. Carrots, six white, Mr. W. Shepherd. Carrots, six Short Horns, Mr. J. R. Carter, Chester, with a good lot. Beet, six, Mr. G. Roughley, the best of twenty entries with Dickson's Reliance. Parsnips, six, the Rev. Canon Blundell, with large roots. Onions, six, Mr. G. Roughley, with immense specimens. Leeks, six, Mr. B. Ashton. Cucumbers, two, Mr. A. Bruckshaw, Tarporley. Tomatos, six red or crimson, Mr. A. Bruckshaw. Tomatos, six yellow, Mr. T. Brocklebank.

FRUIT.—Apples and pears predominated; there were many kinds of good size, but generally deficient in colour. Apples, six culinary, twenty-four entries, Mr. G. H. Colin, first. Six dessert varieties, Mr. W. Mackarell, Formby, first, with Ribston Pippin; same number of entries as previous class. Pears, six culinary varieties, Mr. G. H. Colin; six dessert varieties, Rev. Canon Blundell, with [illegible] Marie Louise. Apples, six culinary varieties, special, Mr. G. H. Colin. Apples, six dessert varieties, special, Mr. Thomas Lunt, Halewood, with Cox's Orange Pippin. For any other kind of fruit Mr. B. Ashton was first with grapes.

Non-competitive exhibits included: Mr. W. Kerr, Dumfries, a large selection of potatos; Dicksons, Chester, apples and potatos; Messrs. W. Kerr and Co., Liverpool, miscellaneous collection of fruit, vegetables, and salads; Mr. H. Middlehurst, The Gateacre, swedes. The arrangements were carried out in a most satisfactory manner.

ONION AND ROOT SHOW AT THAME, October 18.

HEAVY rain attended the holding of Mr. John Walker's popular South Oxon autumn exhibition, the whole of the exhibits being ranged and staged on the open footway in front of Mr. Walker's seed shop and adjoining premises. The prizes offered were fairly liberal, and a brisk competition resulted.

ONIONS.—Four prizes were awarded for a dozen bulbs each of Walker's Exhibition strain, a useful form of White Spanish. Twenty competitors entered the lists (open to all England), the awards falling to Mr. Dover, Fingest, Bucks, first; Mr. R. Lye, Sydmonton Court Gardens, Newbury, second; Mr. Bartlett, Peverill Court, Aylesbury, third; and Mr. Cross, Shabbington, Bucks, fourth, for shapely bulbs measuring an average of fifteen inches round.

ROOTS.—Of these about two hundred and fifty specimens were in competition, and a fair average size was maintained throughout. Turnips were limited to one exhibit only; swedes were good; but the mangolds proved of splendid quality. The awards were as follows: Long red mangolds (six), Mr. T. Elton, Thame, first, weight 130 lbs.; Mr. C. Rose, North Weston, second, 109 lbs. Globe mangolds (six), Mr. T. Elton, first, 109 lbs.; Mr. C. Rose, second, 97 lbs. Golden Tankard mangolds (six), Mr. G. Gale, Chilworth, first, 65 lbs.; Mr. T. Elton, second, 69 lbs. Swedes (six), Mr. T. K. Elton, first, 68 lbs.; Mr. T. Elton, second, 58 lbs. Turnips (six), Mr. H. Reynolds, Notley Abbey, second, 34 lbs. Three long red mangolds (may be garden grown), Mr. C. Bidmead, first, 74 lbs.; Mr. J. Kemp, Haddenham, Bucks, second, 65 lbs. Three globe mangolds, Mr. J. Harris, Shabbington, Bucks, first, 59½ lbs.; Mr. Kemp, second, 59 lbs.

Miscellaneous contributions included a splendid stand of eighteen varieties of show and fancy dahlias exhibited by Mr. G. Saunders, gardener to C. Aubrey Aubrey, Esq., Dorton House (Thame dahlias were all cut off last week by frost); Mr. J. Walker put up nearly one hundred specimens of his selected Intermediate carrot; Mr. M. Brown, grand dishes of Reading Russet and Reading Giant potatos, the latter very handsome, one tuber weighing 21½ ozs.; Mr. A. Briscoe, Haddenham, excellent dozens of Satisfaction, Purple Perfection, Mr. Bresee, and Wordsley Pride potatos, and three gourds averaging 50 lbs. each; Mr. Stevens, Stone, sent Giant Rocca onions averaging 29 ozs. each; Mr. H. Newitt excellent savoys, being the third crop this season and planted after two cuttings of lucerne.

NATIONAL CHRYSANTHEMUM SOCIETY.

SINCE the annual meeting of the National Chrysanthemum Society at the beginning of the year I have spent many hours thinking over the questions there raised, and have come to the conclusion:—

Firstly, that it is time the existing state of things ceased, *i.e.*, the holding of the exhibitions at the Royal Aquarium under the conditions they are at present held, and further, that it is expedient that a proper home for the committee be found in some central part of the metropolis, easy of access from all the great railway termini.

Secondly, that, in seeking to make an alteration, it is necessary to go about the matter in a very careful manner, so that it may be an improvement; as I take it the committee, and the general members of the society as well, are anxious to make every show a success, it behoves the Sites Committee to always bear in mind the absolute necessity of making, or of obtaining, a place that will be equally accessible to those living north of London as to those living south, and *vice versa*, and at the same time to keep constantly in view the fact that there are many thousands of Londoners who pay their 2s. 6d. or 1s. (as the case may be) to view the exhibitions while those exhibitions are held in London. They go, not perhaps so much from a special love of chrysanthemums, as that the society's shows afford them a change from the everlasting theatre. But were the flowers removed from their midst would they make a half-hour railway journey to support the show? Well, the few lovers of the chrysanthemum would, but you may depend upon it that the average sightseer would not, and this would incur a serious loss in receipts, which, according to the financial statement presented to us at the annual meeting, the committee must not for one moment entertain.

Thirdly, then the question seems to me to be to obtain a hall in a central position in London, north of the Thames if possible, capable of holding the exhibition, and that the society should hire it for the time required, and take its own gate, as in my opinion it is only by having an entirely free hand in this matter that the thing can be expected to pay its way. So much for 1899. But what about the twentieth century? We all hope to live longer than 1899, and we hope to see the N.C.S. march along in a manner to justify the amount of money expended on it. Where, then, are we going after 1899? This question will bear going further into. Look, for instance, at the R.H S. holding its meetings in the Drill Hall (Westminster). A Royal society, and cannot boast of a place of its own to meet in! Why cannot this state of things be altered? I suppose the reason is money. Now, if this is the cause, why do not all the horticultural societies, *i e*, all the sections, amalgamate, and see what can be done? The N.C.S. and the R.H.S. each have a goodly number of provincial societies affiliated to them. Why not convert each of these societies into collecting centres? I believe that if this were done sufficient might soon be raised to build a hall that would accommodate both the societies, and, what is more, they might to some extent choose their own position. Each society would within its walls have a permanent home, and perhaps the valuable Lindley Library might be of more general and practical use than in its present *locale*.

I wish you would make the dry bones of contention so rattle as to stir someone great in the horticultural world to move. JASON FEARS.

Hertford, October 15.

Musical Organs in Spiders.—In describing, the other day, the musical organs in spiders, Mr. R. J. Pocock pointed out that the sound organs were in many cases constructed on exactly the same principle as a musical box; and after describing the position of the sound organs and the means by which the sounds were produced, he went on to consider the use of these organs. The activities of any animal, he said, were directed towards one of four purposes—the procuring of food, the avoidance of enemies, the reproduction of the kind, or the protection of the young. The sounding organs of the spider fell into two categories. There were the cases in which the organs were equally well developed in both sexes, and appeared early in the life of the individual; and there were the cases in which the organs appeared only in the male, or were much more fully developed. The significance of the organs in the latter case was purely sexual; and the sounds might serve to assure the female of the identity of the male; for, owing to the strength and voracity of the female, the period of courtship was full of risks for the male. As to the case where the organs were equally developed in both sexes, there was no reason to suppose that they had any sexual significance whatever. Their use was to warn approaching enemies; for when these spiders were attacked it was their habit to rear up and stridulate. These large spiders were poisonous and inedible, and the stridulation was to prevent their being destroyed by enemies in ignorance of their distasteful qualities. The power to stridulate in these cases served the same purpose as the bright colouring which distinguished poisonous reptiles and insects. Where the sounding organs were equally developed in both sexes, there was no reason to believe that the spiders themselves heard the sounds which they produced.

SENTENCED TO DEATH. These are the most terribly significant three words we have in the English language. Thousands of wretched creatures, whose lives have become forfeited to the outraged laws of their country, have heard them pronounced with feelings of sickening terror. The man who has neglected the most simple laws of health feels that all is indeed lost, when the dread sentence is pronounced by the doctor, who has used all his medical skill upon him in vain. In the latter case, however, the door of hope has been opened, through the medium of Holloway's Pills and Ointment. They have effected a cure at the last moment, as thousands of testimonials being constantly received will prove.—[ADVT.]

NEW BOOKS.

Bulletin of the French Horticultural Society of London. (20, Bedford Street, Strand, W.C.)—If any evidence were needed of the vitality and continued prosperity of this young but flourishing society we could do no better than point to its annual *Bulletin* recently published. Bulletin scarcely conveys to the English mind the kind of publication which our French friends resident in England publish year by year, for it is a large sized volume of one hundred and forty-two pages, that would seem to merit a more dignified name. The issue now under notice has several illustrations to accompany the text, and offers to the reader as a frontispiece an excellent phototype portrait of Mr. Harman Payne, whose connection with the society dates back to a time when very few English horticulturists had testified to their appreciation of the society's aims. A short biographical notice by the genial president, Mr. George Schneider, is given explanatory of Mr. Payne's position in regard to French horticulture. The contents are, as usual, varied and numerous, for we find the annual report, showing that the society now counts four hundred and twenty-four members, and has a satisfactory balance in hand, the rules of the society and long lists of officers and various grades of members next appear, together with a list of what we might in English define as affiliated societies. The library, which is an interesting and instructive feature of the society, contains a representative collection of horticultural books, both in English and French, a list of which appears on page 57. Then the *Bulletin* contains concise reports of each monthly meeting held during the past year, together with a special account of the annual dinner held in January, a most enjoyable and successful function, and one that is fast increasing in popularity. The purely literary portion of this publication consists of a series of papers by the members on such subjects as anthuriums, pelargoniums, lilies, adiantums, fuchsias, bouvardias, orchids at Kew, caladiums, &c., some of which indicate considerable pains being taken by the young authors, one of the most notable being the article on the National Chrysanthemum Society's exhibitions of 1897.

Altogether the society is deserving of great credit for the style and get up generally of the *Bulletin*, which, as will be seen from the few remarks already made, contains interesting matters to others than merely members of the society. The president, Mr. Schneider, deserves the warmest thanks of horticulturists on both sides of the Channel for the earnest enthusiasm he displays in the management of the society, whose prosperity so largely depends on his tact and sympathetic appreciation of the needs of the young foreigners who come to our shores.

OBITUARY.

BRIGADE-SURGEON J. E. T. AITCHISON, F.R.S., late of the Bengal Army, whose death occurred the other day at the age of 61, was distinguished as a botanical explorer, and during the last thirty years added much to our knowledge of Oriental floras. In 1878, Lord Roberts, then in command of the Kuram field force, applied to the Indian Government for his services as botanist with the army. There afterwards appeared in the journal of the Linnean Society, in 1880 and 1881, two papers detailing his discoveries and observations in the valleys of the Kuram and Keraia rivers. In 1884, Dr. Aitchison was appointed scientific officer with the Afghan Delimitation Commission, and spent two years in Northern Beluchistan, the Helmund Valley, and the other districts in Central Asia traversed by the Commission. The results of these exploration were embodied in a paper printed by the Linnean Society in their transactions for 1887. Dr. Aitchison was an indefatigable collector. His Afghan and Central Asian collections amounted to more than twenty thousand specimens of plants, which were distributed to Kew and the other principal herbaria of the civilised world. He was accustomed to add to them valuable original observations regarding their economic value.

MR. GEORGE TAYLOR, who for so many years was associated, as foreman, with Messrs. J. Veitch and Sons at their Chelsea Nursery, died, we regret to hear, a week or so ago at Deal. Since retiring from active service Mr. Taylor has resided at Deal, and there a large number of his old acquaintances gathered to pay their last respects on Tuesday last.

Sutton's Champion Scarlet Horn Carrot.—This is a very much improved stock of the Early Nantes, and has been grown by me in a trial of several varieties this year. So far as everyone knows we have had an exceptionally bad carrot season, indeed it has been generally the worst I have ever known. That has been through no fault of stocks but entirely of weather. But on the exceedingly dry, porous soil at Richmond, where the trial took place, Champion Scarlet Horn has proved to be the very best. The roots are not large, being within about six inches long, of medium breadth, cylindrical in form, abrupt ended, of rich scarlet hue, and the flesh when cooked exceedingly succulent and delicious. It is such a carrot as I would have alone for my table had I a garden. All the large carrots, fine to look at, are not to be compared with this one for table excellence. It is good to sow in frames, on warm borders, in the open quarters in April, and not least for winter pulling in July.—A D.

A Plea for the Owl.—Owls' feathers have lately been very prevalent in hat trimmings, and attempts have been made to justify their use on the ground that the owl does great harm to pigeons, poultry, and small birds. The following statistics, quoted by the Massachusetts Audubon Society for the Protection of Birds, have been prepared to exonerate owls in general from the charges brought against them, and to enlist in their defence the sympathy of all lovers of interesting, harmless, and helpful wild life. There are five species of owls, which may be termed common in the eastern United States; of these the screech owl is by far the commonest, and probably outnumbers all the other species together. This owl has the following record: Out of 255 stomachs examined, none contained pigeons or poultry, 16 per cent. contained the remains of birds, and 80 per cent. those of mice, insects, and English sparrows. The figures for four of the common species—the screech owl, the barred owl, the long and short-eared owls—are as follows: Of 572 stomachs examined, 1 1-5th per cent. contained poultry or game birds, 9 per cent. small wild birds, 52 per cent. mice, and 26 per cent. insects. The great horned owl, it is true, has a bad record, for of 127 stomachs examined, 25 per cent. contained the remains of poultry or game, and only about 23 per cent. those of mice or insects. This owl, however, is becoming one of the rarer species, and it is unfair, to say the least, to condemn the whole family on account of one black sheep. Dr. Fisher goes farther and points out the grave injury which would inevitably result to the farmer and to the gardener if owls were persecuted. The figures given above do not, of course, give the exact proportion of good which owls do; some individuals had nothing in their stomachs, some had other mammals or spiders; but it is certainly safe to befriend in every possible way the four species whose bill of fare is so constituted that four out of every five individuals dine on mice or insects.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Dendrobium chrysanthum.—W. A., Newcastle-on-Tyne: This fine orchid flowers at various times of the year, but mostly during autumn or winter. It grows best if placed in a well-crocked teak basket, using fibrous peat and sphagnum moss as compost; suspend the basket in a stove where plenty of light can be afforded at this season of the year. New compost should be afforded or the plant re-basketed as soon as the new growths are an inch or so in length. While growing freely, plenty of heat and moisture are necessary, but when the pseudo-bulbs cease to elongate, and no more leaves form, water must be given sparingly; do not absolutely dry the plant off, however, but place it at the cool end of the stove or in an intermediate house while at rest.

Disqualification at Flower Shows.—Enquirer, Kent: Thanks for schedule. Provided your statements are correct, and we have no reason for disbelieving them, the judging at the show in question was most unfair. The exhibitor who was awarded the second prize could have legally claimed the first, provided he showed according to schedule, while the exhibit gaining first prize contained eleven instead of six sorts of vegetables. We are inclined to think, however, that some mistake has been made, though we cannot suggest where, especially as in other classes the judge rightly disqualified competitors who did not conform to the schedule. It would be interesting to know the judge's opinion in connexion with the vegetable class, and also to whom he awarded the first prize. With regard to cucumbers you were wrong; the schedule asked for three, not for two, though only a brace was needed in the cottagers' division.

Paraffin Wash.—S.T.: Paraffin should invariably be used in the form of an emulsion because of the difficulty of mixing the oil with the water. The following instructions given by the Maryland Experiment Station for the preparation of a paraffin emulsion for the destruction of aphids on peach and other trees will afford you the desired information. Take half a pound of soft soap, one gallon of water (rain water if convenient), and two gallons of paraffin. Put the water in a vessel holding four or five gallons, add the soap, place on a stove. and bring to the boiling point, occasionally stirring it to thoroughly dissolve the soap; then remove to the yard, or some convenient place away from the fire, and pour the paraffin directly into the water. This should then be pumped in and out of the vessel with a good force pump for from five to ten minutes, or until the emulsion is formed. If properly made, it will have the appearance of buttermilk, and will readily mix with water without any oil coming to the surface. It will keep an indefinite length of time, becoming a semi-solid when cold. If used when fresh it can be diluted with cold water to the strength desired; but if cold and hard, warm water should be used. Every gallon of the emulsion used should be diluted with from 10 to 13 gallons of water, and applied with a good spray pump.

Diseased Tomatos.—J. D., Carnarvon: Your tomatos seem to be attacked by several diseases, and are in such a bad way generally that there appears to be little hope of those not yet showing distress doing much good. Fungoid pests are so easily distributed that the damage is done ere the grower notices anything wrong. Some day—and the time is not far distant—every gardener of importance will keep Bordeaux mixture and sulphide of potassium in his store-room, just as now he considers it necessary to keep a stock of tobacco rag or vaporisers, whichever he may use for fumigating. For some years past the most successful growers of plants and fruits have fumigated with some degree of regularity, believing in the prevention of insect pests rather than the radical cure of a plague. So with fungoid diseases; where certain plants are grown, which by reason of their high cultivation, excessive propagation, and weak tissues, become predisposed to fungoid attack, then fungicides of known value should be used upon them occasionally in the form of spray, so that stray spores may be destroyed and prevented from germinating. Remove all affected leaves and burn them, together with all badly affected plants, and then spray the remaining plants, surface soil, walls, &c., with the fungicide, following this with other sprayings at intervals. We presume that as regards airing, watering, and feeding, the plants have been carefully tended. We should be inclined to make a fresh start, if strong plants are obtainable, after an effectual clearance.

Raising Gladioli from Seed.—S. M., Banbury: The seed should be kept in a dry, cool place during the winter. As the sample sent is not very ripe, we suggest that previous to storing it the opening pods should be laid on sheets of paper on a stage in a greenhouse, where they can be kept from damp, and have all the sunshine possible to assist in the proper ripening of the seeds. The best time to sow gladiolus seed is early in March; use large and fairly deep pans of good sandy soil, crock these carefully, and sow the seed thinly. Place the seed pans in a gentle heat until the seedlings appear, then move to cooler quarters, reducing the temperature gradually, and keeping the seedlings as near the glass as safety permits; this gradual hardening off should continue until, in the summer, the pans may be stood out of doors. If care is taken to keep the young gladioli growing steadily until autumn, and if the plants have not been overcrowded, some nice corms should be formed, and these may be carefully ripened and stored, like older bulbs, for the winter. In the ordinary way quite a number of these corms should flower the second season. The middle of March will usually be early enough to plant the corms, selecting a warm border and rich soil; six inches apart will probably suffice, but more room should be given if the corms are of a size to justify a hope of their flowering. Plant the corms from two to three inches deep, the latter depth for the larger sizes.

Early-flowering Chrysanthemums.—T. R., Hampton: One of the most useful reports upon early-flowering chrysanthemums that has hitherto been published appeared on p. 578 of our issue of September 18, 1897. This report was made after an examination of the large trial held at Chiswick; thirty-two of the best varieties are fully described, and their heights, habit, and size of flowers given. These varieties are grouped according to colour. A further report appeared on p. 650, in the issue of October 16, 1897, when all the varieties gaining an award of three marks at Chiswick on October 4 were briefly described. Appended we gave a list of the varieties then on trial, which had a few half-opened buds, or at most but two or three open flowers, on October 7 of that year; also a list of varieties that had no flowers open on that date, and consequently could have no claim for consideration as early-flowering chrysanthemums for border culture. It should be remembered that the climate and soil of Chiswick Gardens are such that varieties proving unsuitable there as early-flowering would most likely be equally unsuitable a good deal further south. The taste for early-flowering chrysanthemums is growing rapidly, and to meet the demand nurserymen have of late introduced a number of continental and other varieties, so that there seems to be a pressing need that the Royal Horticultural Society should continue to extend its trials of these beautiful autumn flowers at its Chiswick Gardens.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

W. A., Newcastle-on-Tyne: Dendrobium chrysanthum, which see.

J. S., Glasgow: 1, Cydonia japonica; 2, Berberis stenophylla; 3, B. Darwini. The Cydonia (or Pyrus) japonica fruits freely in the southern counties but not so readily in the north. A preserve can be made from the fruit. Grow the shrub against a wall.

J. C. B, Warwick: 1, Aster Novi-Belgi densus; 2, A. cordifolius elegans; 3, A. ericoides; 4, A. multiflorus.

C. G., Exeter: 1, Rudbeckia speciosa; 2, Ligustrum ovalifolium aureo-variegatum; 3, Cratægus pyracantha Leelandi.

A. B., Romford: 1, Tecoma radicans; 2, Hibiscus syriacus.

Names of Fruits.—We are pleased to assist our readers as far as it is possible to do so in naming fruits, but it is absolutely necessary that they should send us good specimens carefully packed, as it is only when characteristic examples reach us in perfect condition that we are able to determine their names. We are compelled to insist on the observance of this rule, as so many specimens now reach us. We cannot undertake to name more than six varieties at one time; and both apples and pears should be sent when approaching maturity, but before they are fully ripe, that we may have the assistance of their distinctive colours in determining their identity.

L. E. B., Uxbridge: 1, Autumn Bergamotte; 2, Marie Louise d'Uccle; 3, d'Arcy Spice.

D. B., Wellingborough: 1, Pitmaston Duchess; 2, Duchesse d'Angoulême; 3, Beurre Bosc; 4, Princess; 5, Marie Louise; 6, Nouveau Poiteau.

J. M., Botley: 1, Yorkshire Beauty; 2, Tibbett's Pearmain; 3, D'Arcy Spice; 4, Fearn's Pippin; 5, Mank's Codlin; 6, Thompson's.

R. P., Uttoxeter: 1, Northern Greening; 2, Norfolk Beefing; 3, Queen Caroline; 4, Tom Putt; 5, Blenheim Orange.

W. G., Southall: Alfriston.

F. C., Alverstoke: 1, Tower of Glamis; 2, Cambusnethan Pippin; 3, Frogmore Prolific; 4, Margil; 5, Autumn Nelis; 6, Beurre de Capiaumont.

E. K., Keston: The bulk of the apples were Calville Rouge Précocée; one apple, just going rotten, appeared to be Emperor Alexander.

A. L., Wimbledon: 1, Bishop's Thumb; 2, Beurre d'Amanlis; 3, Comte de Chambord; 4, Withington Fillbasket; 5, London Pippin; 6, Northern Greening.

G. S., Guildford: 1, a form of Blenheim Pippin; 3, Rymer.

H. W., Penshurst: 1, Cornish Aromatic; 2, Frogmore Prolific; 4, Queen Caroline; 5, Lane's Prince Albert; 6, American Mother; 7, Emperor Alexander; 9, Autumn Bergamotte.

J. S., Glasgow: You have not complied with the rules we publish concerning the naming of fruits. The fruits were not good specimens, and fixing the numbers on with tin tacks made them worse. We have named the best; if you send good samples of not more than six others we will do our best to assist you. 1, Dutch Mignonne; 2 and 5, Dumelow's Seedling; 3, probably a local seedling, a good apple, however; 7, Court Pendu Plat; 11, Blenheim Pippin; No. 2 pear is Autumn Bergamotte.

THE WEATHER DURING THE WEEK ENDING OCTOBER 15, 1898.

The mean reading of the Barometer during the week at Greenwich was 29·64 inches, and that of the Thermometer 49°·5, the latter being 1°·2 below the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 29 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 12·5 hours. The measured rainfall amounted to 0·42 of an inch.

MARKETS.

Covent Garden.

RATHER better contributions have brought the market supplies up to the average, and the demand throughout is steady and good. Prices for green vegetables are firm. Cut flower trade improving.

FRUIT.—English apples, 4s. to 8s. per bushel; Nova Scotian, 15s. to 25s. per barrel; English grapes, 10d. to 2s.; Channel Island, 6d. to 1s. per lb.; Almeria, 9s. to 16s. per barrel; Lisbon, 7s. to 10s. per case; bananas, 5s. to 9s. per bunch; lemons, 15s. to 25s. per box; oranges, 10s. to 16s. per case; pineapples, 2s. to 5s. each; English tomatos, 3s. 6d. to 4s. 6d.; Channel Island, 2s. 6d. to 3s. per 12 lb.; Bordeaux, 2s to 3s. per case; peaches, 2s. to 8s.; green figs, 9d. to 1s. 3d. per dozen; English pears (Williams), 8s. to 10s. per bushel; damsons, 2s. 6d. to 3s. 6d. per half-sieve; Spanish melons, 5s. to 7s.; pomegranates, 4s. to 6s. 6d. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 2s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 3s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. 6d. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; white gladiolus, 8d. to 1s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Valencia onions, 5s. 6d. to 6s. 6d.; Ports, 6s. to 7s. per case; Dutch picklers, 2s. 6d. to 3s. 6d. per bag; Brussels sprouts, 2s. 6d. to 3s. 6d. per half sieve; spinach, 3s. to 4s per bushel; cabbages, 4s. 6d. to 9s. per tally; endive, 1s. 4d. to 2s.; lettuce, 1s. 3d. to 2s.; French, 2s. to 3s.; cucumbers, 2s. to 4s.; cauliflowers, 1s. to 2s. 6d. per dozen; turnips, 2s. 6d. to 3s. 6d.; carrots, 2s. 6d. to 3s. 6d.; parsley, 2s. to 2s. 6d. per dozen bunches; mushrooms, 2s. 6d. to 3s. 6d. per peck; potatos, 60s. to 90s. per ton.

Borough Potato Market.

Supplies have increased, and are now fairly heavy, but the growing demand keeps prices firm. Beauty of Hebron, Snowdrops, and Up to Date, 3s. 6d. to 4s.; White Hebron, Early Puritan, Bruce Magnums, Sutton's Early Regent, Reading Giants, and Imperators, 3s. to 3s. 6d.; Black Lands, 2s. 6d. to 2s. 9d. per cwt.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, OCTOBER 24.—National Chrysanthemum Society; Floral Committee at 1 p.m.; General Committee at 7 p.m.

TUESDAY, OCTOBER 25.—Royal Horticultural Society: Committees meet at 12 o'clock; Lecture at 3 p.m. on Experimental Horticulture, by Mr. George Gordon, V.M.H.

WEDNESDAY, OCTOBER 26.—Mr. R. Sydenham's Vegetable Show at Birmingham; Two days.

THURSDAY, OCTOBER 27.—Exmouth Chrysanthemum Show; Two days.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY, OCTOBER 24, 25, 26, 27, AND 28.—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

FRIDAY, OCTOBER 28.—Imported and Established Orchids, Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

WEDNESDAY AND THURSDAY, NOVEMBER 1 AND 2.—Roses, Carnations, Begonias, Hollyhocks, Lily of the Valley, &c., Messrs. Protheroe and Morris, Hale Farm Nurseries, Tottenham, N.

WEDNESDAY, OCTOBER 26.—Laurels, Aucubas, Carnations, &c., Messrs. Protheroe and Morris, Avenue Nursery, Brondesbury Park, Willesden Lane, N.W.

WEDNESDAY, OCTOBER 26—Standard and Dwarf Roses, Shrubs, &c., Mr. J. C. Stevens, King Street, Covent Garden.

THURSDAY, OCTOBER 27.—Orchids, Mr. J. C. Stevens, King Street, Covent Garden.

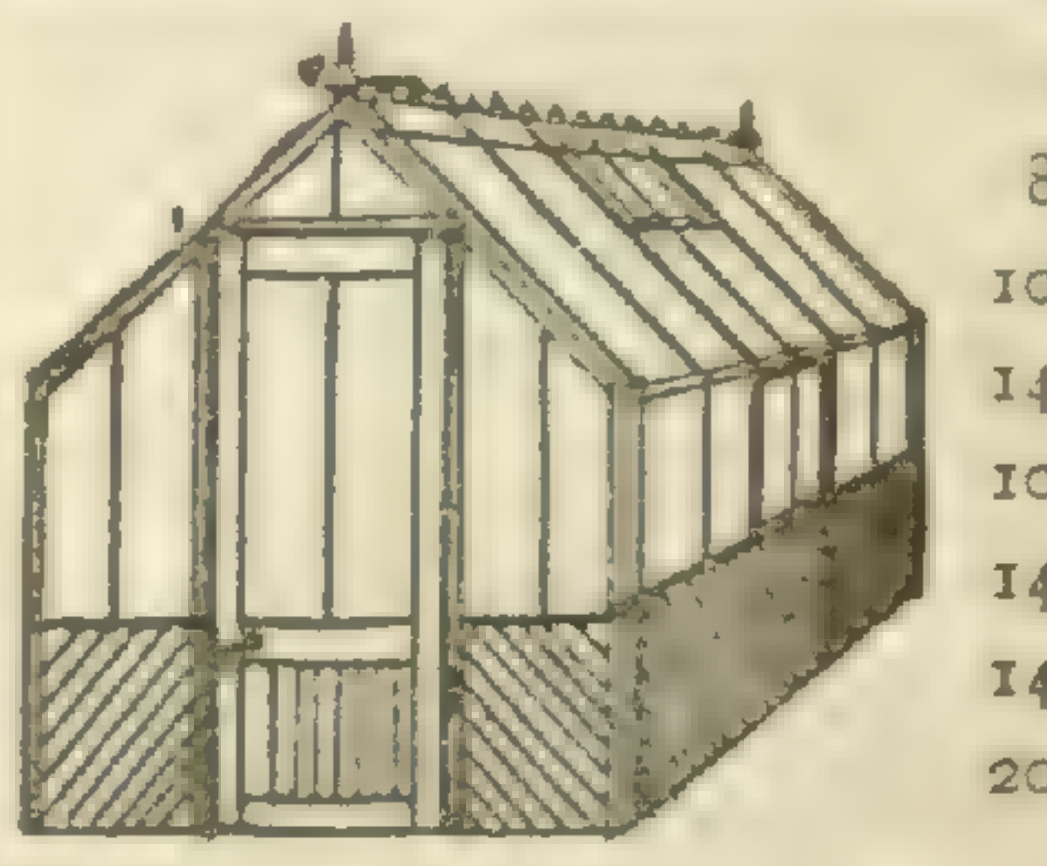
OUR CELEBRATED
NO. 4 CHECK END BOILER,
To heat from 300 ft. to 3,000 ft. of 4 in. piping.

CARRIAGE PAID on orders of 40s. and upwards to most Goods Stations.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

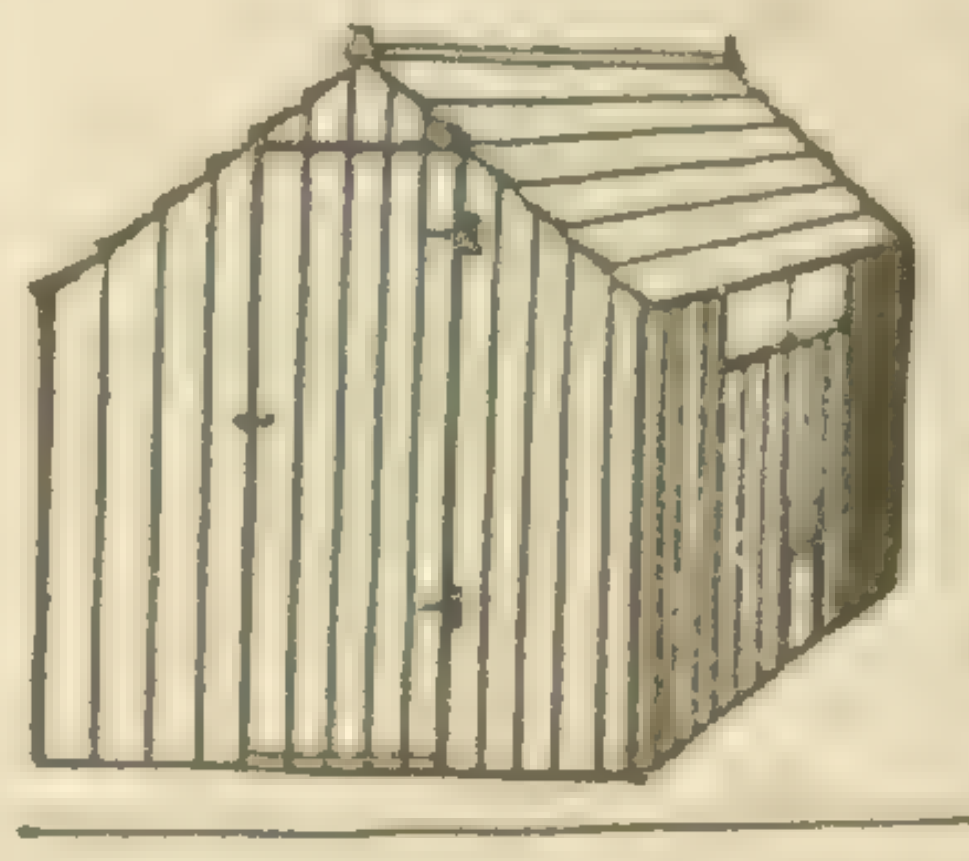


Size.	Lean-to.	Span.
8 × 5	36/-	48/6
10 × 5	48/6	58/6
14 × 6	58/6	78/6
10 × 8	58/6	72/6
14 × 8	78/6	95/-
14 × 10	95/-	£5/7/6
20 × 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison :—
£3/10/0 buys elsewhere 8 × 5 lightest possible make.
£3/12/6 buys from us 10 × 8 extra substantial make.
All sizes are in proportion. Need we say more?

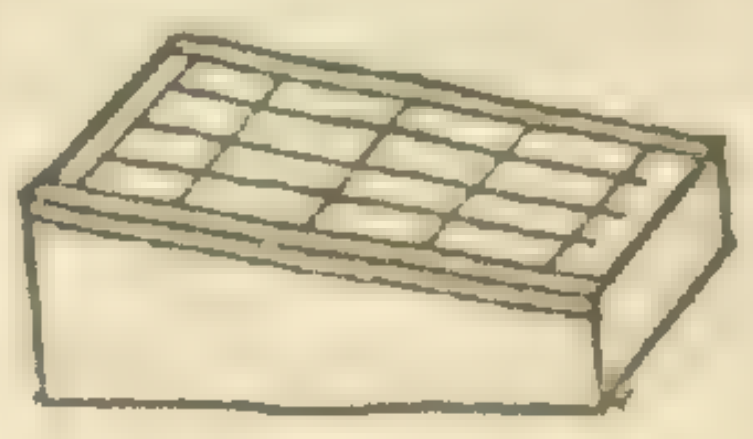
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to.	Span.
Ten	4 × 3	10/9	12/9
Twenty	5 × 4	12/9	16/6
Forty	7 × 5	17/6	22/6
Hundred	12 × 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.



Size	Price
4 × 3	8/9
6 × 4	14/6
8 × 6	22/6
12 × 6	33/-

21 oz. glass, strong lights (a few cheaper, 4 × 3 & 6 × 4 left).

Apply for List to—

HYPOLITE, DEPTFORD.

THOSE having **Houses to Let or Sell,** or Apartments to Let, whether in town or country, should send an advertisement to the "CITY PRESS." Prepared only by the Proprietor—

THOMAS BEECHAM, St. Helens, Lancashire.

A WORD OF CAUTION

SHOULD BE GIVEN TO OUR HORTICULTURAL FRIENDS.

STUDY and experience have demonstrated the falsity of the principle of Magic Stimulants. The unwise administration of crude chemicals sacrifices Vigour and Vitality in Plant-life, and disturbs and impoverishes the balance and quality of the Soil. The rational method of Fertilisation is to GENTLY FEED the Plant-life with a combination of such organic compounds as are suited to its varying requirements.

SUCH A SAFE AND GRADUAL PLANT-FOOD is our Celebrated

"LE FRUITIER."

It is HIGHLY CONCENTRATED. As quick in Action as it is safe to be, whilst its Lasting Properties are such as to have earned for it everywhere the name of—

"THE PERFECTION OF PLANT-FOOD."

The best Testimonial to this Manure, perhaps, is that Market Growers (who, of course, grow for profit) use it in preference to any other. As an instance, Mr. FEATHERBY, the well-known Fruit Grower for Covent Garden Market, has, during the last four years, ordered **28 TONS of "LE FRUITIER."** This speaks for itself.

A TRADE OPINION OF "LE FRUITIER."

"Dear Sirs,—Since 1895 I find I shall have used 28 tons of your '**LE FRUITIER**,' and my order for this season being the largest I have given you is the best evidence of my opinion that I can offer of your '**LE FRUITIER**.'—Yours truly,

"GEORGE FEATHERBY.

"To Messrs. Wm. Wood and Son (Ltd.), Wood Green."

TEST EXPERIMENTS WITH "LE FRUITIER" AT A PRIVATE ESTABLISHMENT.

"Mr. McFARLANE, Head Gardener to HARVEY DU CROS, Esq., at Cornbury Park, Oxfordshire (who has special facilities for conducting such experiments), has thoroughly tested our '**LE FRUITIER**' against three other well-known Vine Manures, under exactly the same conditions, and conclusively proved (as so many others have done) that no other Fertiliser will give such good results as '**LE FRUITIER**.'"

Single cwts. 20s, Carriage Paid to any Station in Great Britain. Special Trade and Bulk Quotations for this Celebrated Manure (carriage paid to any part of the United Kingdom), or for Export. "Le Fruitier" is packed in Sealed and Branded Bags,

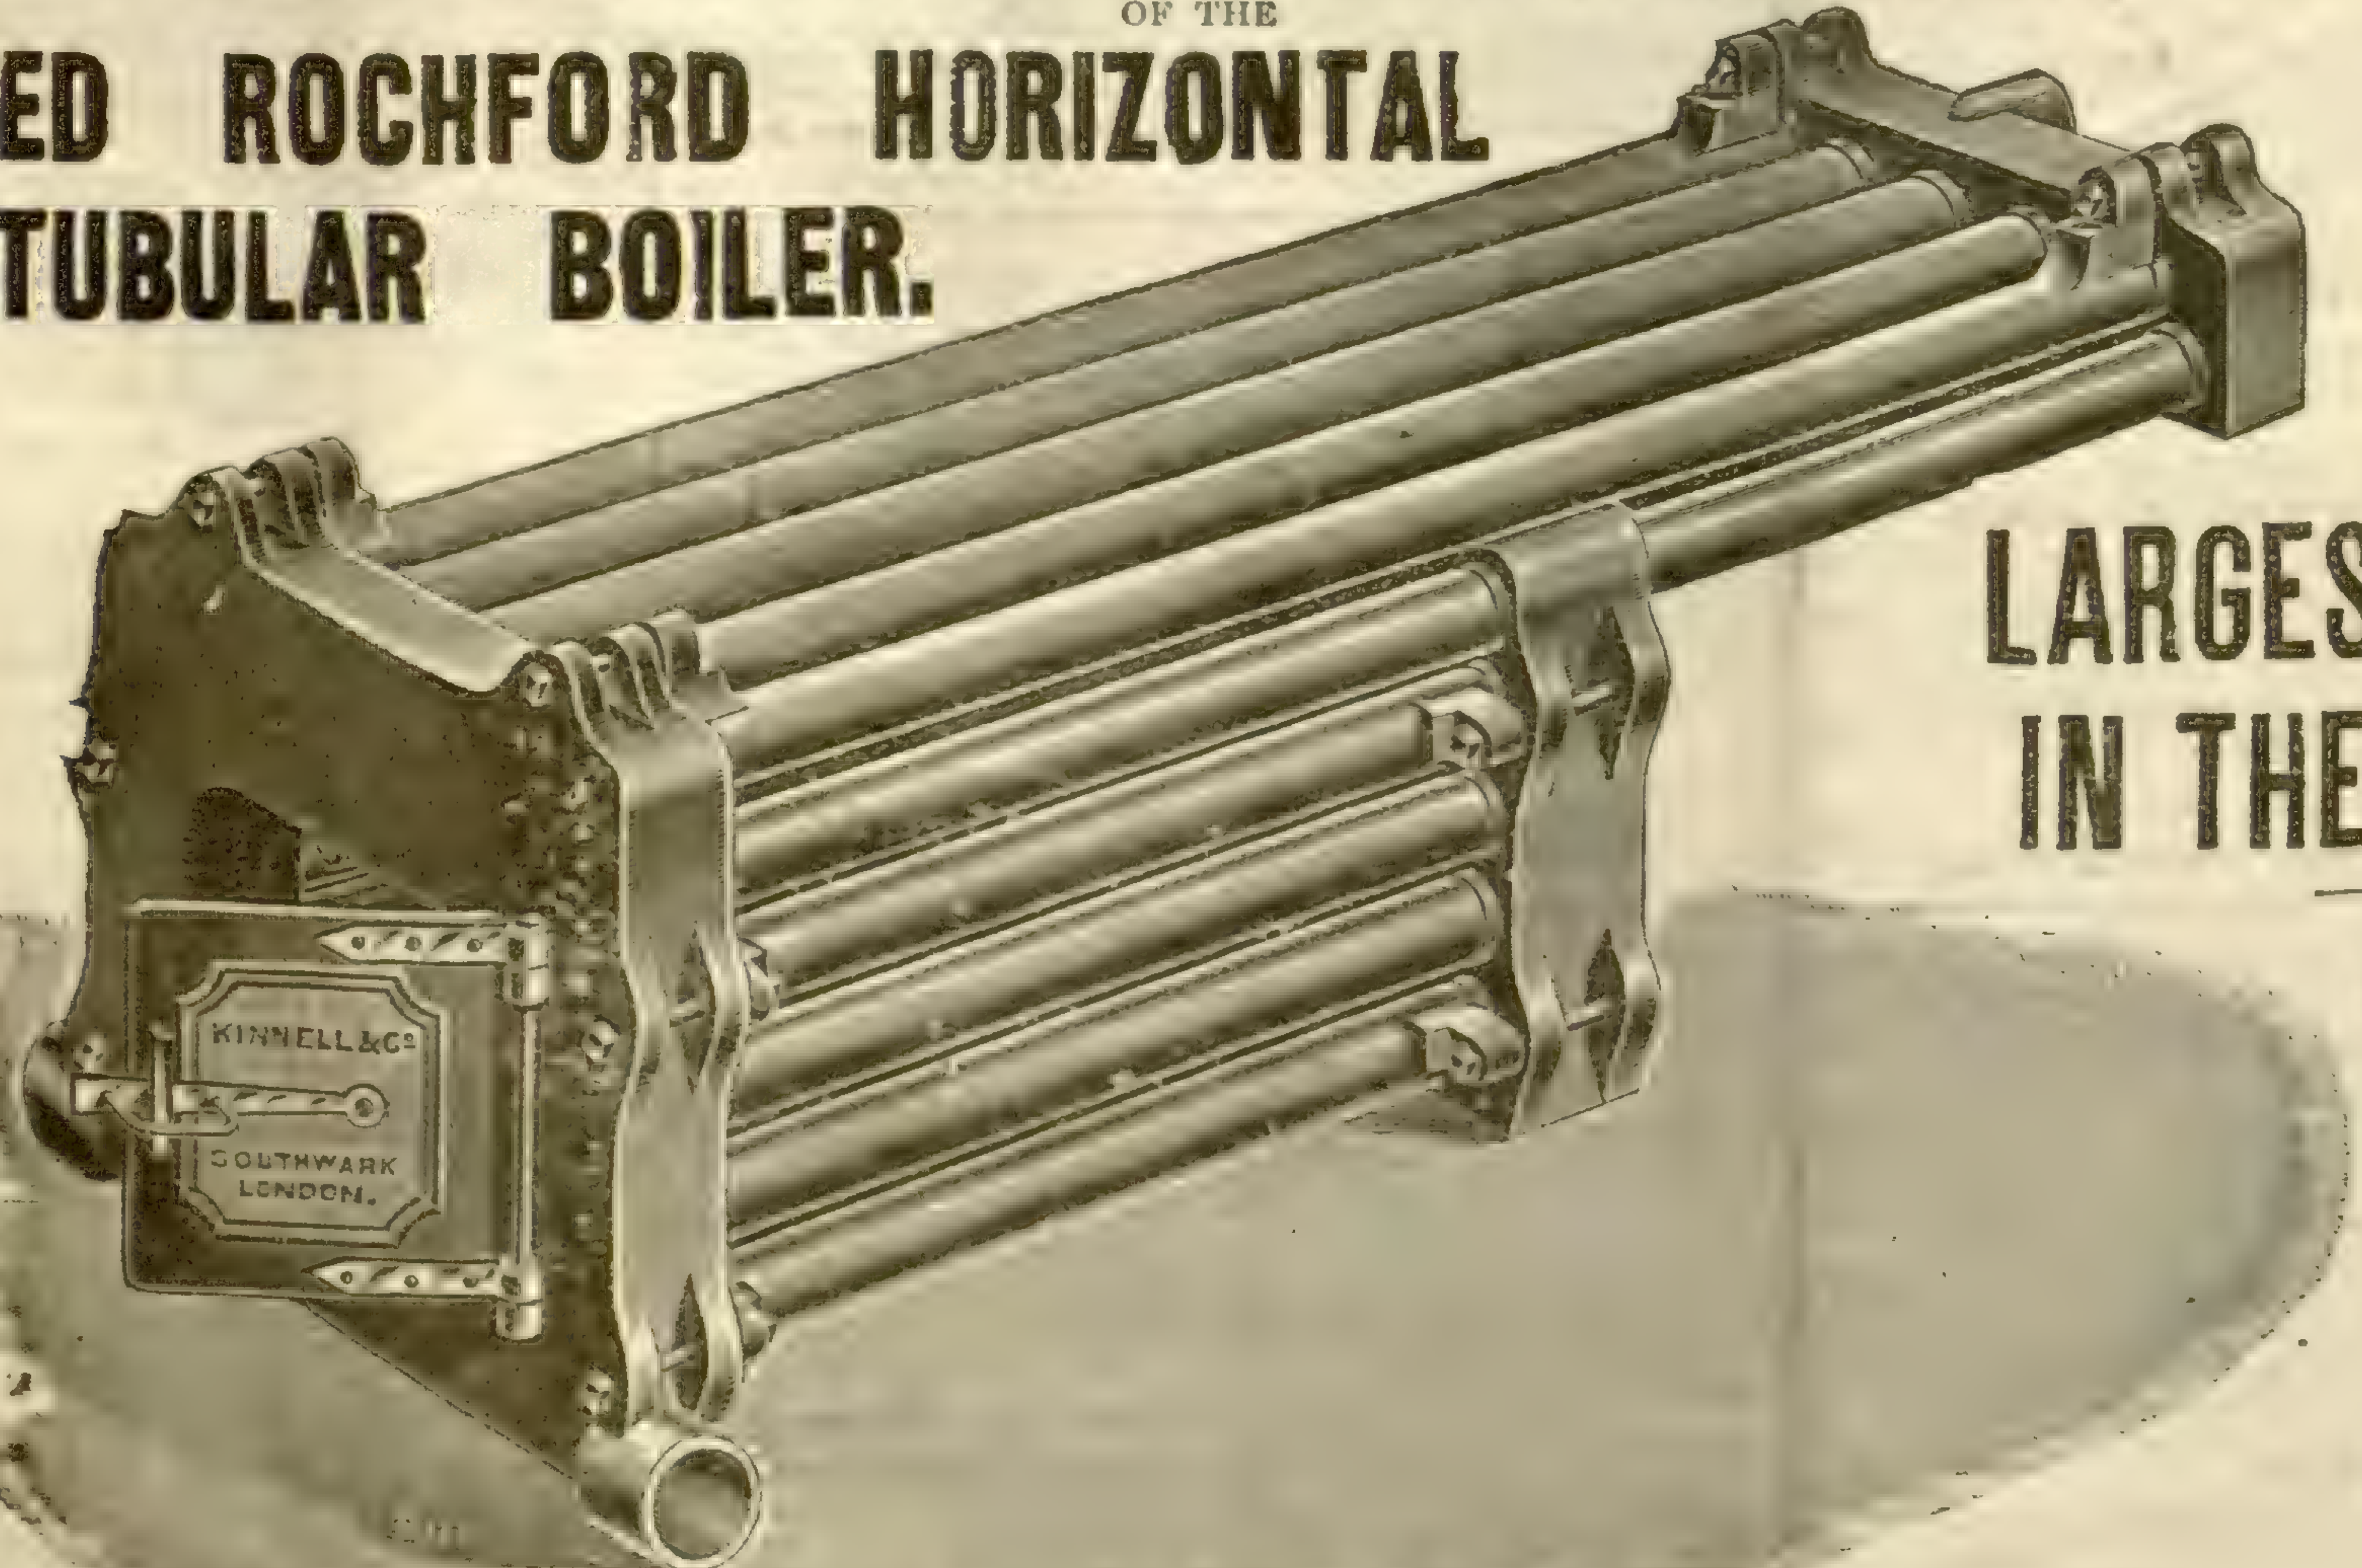
OF THE

IMPROVED ROCHFORD HORIZONTAL TUBULAR BOILER.

Specialities FOR Greenhouse Heating.



LARGEST STOCK IN THE TRADE.

ENGINEERS SENT TO ALL PARTS.

Plans AND Estimates Free.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.

To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.

Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application.

Offices and Warehouses, **SOUTHWARK STREET, LONDON, S.E.**

BARR'S DAFFODILS

GOLD MEDAL

The Most Lovely of all Spring Flowers.

SEND for BARR'S DAFFODIL CATALOGUE, illustrated with original photographs taken at the Long Ditton Nurseries, and containing a Descriptive List of all the finest Daffodils in cultivation and the latest Novelties for 1898. Free on application.

A FEW FINE SORTS FOR POTS OR OUTDOORS.

Emperor, petals primrose, trumpet full yellow, large flower of great substance. Per 100 30/-, per doz. 4/6.

Henry Irving, one of the earliest, very large flower, fine deep golden yellow. Per 100 21/-, per doz. 3/-.

Queen of Spain, very beautiful delicate soft yellow, with reflexing petals. Per 100 17/6, per doz. 2/6.

Bicolor Horsfieldii, petals pure white, trumpet golden, handsome; very early. Per 100 17/6, per doz. 2/6.

Incomparabilis Sir Watkin, a very handsome large flower, petals sulphur, cup rich orange-yellow. Per 100 25/-, per doz. 3/6.

Barrii conspicuus, broad yellow petals, cup conspicuously edged bright orange-scarlet; a beauty, and a general favourite. Per 100 17/6, per doz. 2/9

Leedsii M. M. de Graaff, broad white petals, white cup suffused orange, very beautiful. Per doz. 8/-.

Triandrus albus (Angel's Tears), a gem on rock-work, pretty cream-coloured flowers, petals reflexed. Per 100 8/6, per doz. 1/3.

Poeticus Poetarum, most beautiful of the White Poets' Daffodils. Per 100 12/6, per doz. 1/9.

BARR'S General BULB CATALOGUE containing a descriptive List of the best Bulbs and Tubers for autumn planting, and a List of Bulbs and Plants for early forcing, *free on application.*

YORK CHRYSANTHEMUM SHOW.—The NINETEENTH ANNUAL SHOW will be held NOVEMBER 16, 17, and 18, 1898. Upwards of £200 offered in Prizes, in liberal proportions, for Plants, Cut Flowers, Fruit, and Vegetables.
Schedules, &c., to be had from
J. LAZENBY, 13, Feasegate, York.
Challenge Prize, value £20, added to 1st Prize (£10) for 36 Cut Blooms. £7 and Cup (£5) for Group. Entries November 9.

HORTICULTURAL CORRESPONDENCE CLASSES.—For PROSPECTUS and LIST of PRIZES apply T H. SMITH, 13, Somerville Road, Small Heath, Birmingham

NOTES OF THE WEEK.

THE AMATEUR QUESTION.

THE solution of the amateur question has long been regarded by a considerable proportion of the committees of horticultural societies as one of the most difficult problems with which they have to deal in the preparation of exhibition regulations; yet the question is simplicity itself, for the definition of an amateur to be found in any dictionary of the first rank has the sanction of common sense and legal authority. The case of Stredwick v. Dean, heard in the Hastings County Court on Monday last, amply confirms this view, and as illustrating the law upon the subject, and also the importance of clearness of expression in rules and regulations, is of general interest. Last year the National Chrysanthemum Society decided to increase the classes at their November exhibition in which the competition would be limited to those who either grow their plants themselves or who do not employ more than one gardener. In accordance with this decision the committee provided in the schedule seventeen classes, which were arranged in two sections, one of these being for amateurs who employed a gardener and the other for those who had no paid assistance. Mr. Stredwick, who is engaged in business at St. Leonards as a horticultural builder, and is a successful cultivator of the chrysanthemum, competed in the first of the two sections, and was awarded several prizes. Subsequent to the awards being made a protest was lodged against Mr. Stredwick's qualification to compete as an amateur, and having considered the protest and ascertained that he issued a catalogue the committee withheld the prizes. Some correspondence followed, and, as stated in our issue of the 22nd, Mr. Stredwick entered a plaint in the Hastings County Court for the recovery of the value of the prizes, and the case was heard on Monday, with the result that the decision of the committee was upheld, and judgment given in favour of Mr. R. Dean, who, as secretary, represented the National Chrysanthemum Society. The question was raised at the commencement of the proceedings whether Mr. Stredwick was not debarred from taking legal proceedings by the fact that the rules stipulate that the decision of the Arbitration Committee, to whom the question had been submitted, shall be final. But the judge having ascertained that Mr. Stredwick had not been invited to attend the meeting of the Arbitration Committee when the protest was considered, decided to hear the case, observing that in accordance with a well-known principle of common law no decision in cases of this kind should be decided without both parties having an opportunity of being heard. Mr. Stredwick readily admitted, in the course of his evidence, that during 1897 he had issued a catalogue and sold plants and cuttings; but he contended that he was still an amateur, and as fully entitled to compete in the amateurs' classes in 1897 as in the year previous to his issuing a catalogue, as he sold plants and cuttings "for the purpose of recouping the expense to which he was put in the purchase of novelties," and with a view "to make a business for his son." The judge said an amateur might be permitted to occasionally sell a few surplus cuttings or plants, but immediately he issued a catalogue he became a nurseryman, and was barred from competing in classes limited to amateurs. The judge commented on the regulations relating to the definition of amateurs in the N.C.S. schedule, and strongly advised the representatives present to take the necessary steps to have them amended and rendered more intelligible, and with this advice we heartily concur. The ambiguity has arisen in consequence of a want of appreciation, on the part of a section of the committee, of the fact that all cultivators who do not grow for sale are amateurs. The erroneous view is held that an amateur is a cultivator with limited resources, whereas, both from the common sense and legal point of view, the owner of a garden under the charge of a skilled head gardener with a large staff is just as much an amateur as the cultivator who owns a small plot and does all the work himself. What is much required in the Society's rules is a clear declaration that no one who systematically sells cuttings, plants, or blooms shall be allowed to compete as an amateur, and this having been provided it will be a very easy matter to so arrange the sections as to enable the several classes of cultivators to compete under conditions as nearly equal as it is possible to make them.

INFLUENCE OF MANURES ON POTATO DISEASE.

IT is a matter of common knowledge that the weather is the most important factor in determining an attack of the fungus causing the potato disease, and it is desirable that it should be equally well known that manures have a direct influence in its development. In the report on the Rothamsted experiments in the cultivation of potatos it is conclusively shown that during the period over which the investigations extended the proportion of diseased tubers was the smallest where non-nitrogenous manures were used; or, in other words, the crops which made a short sturdy growth, and attained maturity at a comparatively early period of the season, suffered the least from the attack. On the other hand the crops growing in soil supplied with nitrogen made a luxuriant growth, which was continued until late in the season, and in consequence of the softness of the tissues enabled the mycelia of the fungus to rapidly spread over the whole plant. In these crops were found the largest proportion of diseased tubers. It was, indeed, proved that when unfavourable climatic conditions are experienced, those tubers suffer the most which have the richest juice; or, to put it in another way, which have the least fixity of composition. In all these cases there was a higher, and sometimes a considerably higher, percentage of nitrogen in the dry substance of the diseased than in that of the sound tubers, indicating a loss of potash and other mineral substances. The still white and also the separated discoloured portion of the flesh of the diseased tubers were analysed, and the analyses demonstrated the fact that while the juice of the white flesh contained approximately the normal amount of nitrogen, that of the discoloured portion contained considerably less. The washed "marc" of the white portion, on the other hand, contained a very small proportion of nitrogen, while that of the discoloured portion considerable quantities. The distribution of the mineral matter followed to an appreciable extent that of the nitrogen, and justifies the opinion that the juice had been deprived of a material proportion of both its nitrogenous and mineral matter during the growth of the fungus. There was also more sugar in the diseased than in the sound tubers, and it is assumed, and rightly so, that this materially aided the growth of the peronospora. The first material change in the development of the disease appears to be the destruction of starch and the formation of sugar. There is also a considerable loss of organic, and chiefly non-nitrogenous, substance, due in part to the evolution of carbonic acid, as a coincident of the growth of the fungus at the expense of the available organic substance, this being a characteristic of the growth of the fungi of which the species attacking the potato is the type. It will therefore be seen that the results obtained in the course of the investigations are quite consistent with the fact that the fungus attains to the highest degree of development in tubers produced by plants grown with the aid of highly nitrogenous manures, and having a juice rich in nitrogen. A full available supply of mineral matter is essential to the successful growth of the potato, but these being provided, the amount of produce depends in a large measure upon the available supply of nitrogen. The soundness of the practice of successful cultivators is amply confirmed by these experiments, for they conclusively prove that nitrogen used in proper proportions is of immense advantage, while when applied in excess it predisposes the plants to disease by encouraging the production of luxuriant haulm, through which the fungus is able to extend with extreme rapidity.

Chrysanthemum Exhibitions increase in number year by year, and the coming month will be a very busy one both for amateur and trade growers who do much exhibiting. Whether this excessive multiplication of exhibitions is an unmixed blessing it is rather difficult to say; we think not, and would much prefer to see district rather than purely local shows, shifting the venue year by year throughout the district. Our diary shows that not less than one hundred and forty chrysanthemum exhibitions will be held in the United Kingdom during November, and we do not pretend that ours is a complete list; doubtless the secretaries of small and comparatively insignificant societies have not taken the trouble to send in their show dates; it contains, however, all the leading displays in the four countries. The month opens with ten exhibitions, followed by eighteen on the 2nd, fourteen on the 3rd, three on the 4th, two on the 7th, ten on the 8th, nineteen on the 9th, seven on the 10th, thirteen on the 11th, one on the 12th, one on the 13th, eleven on the 15th, thirteen on the 16th, six on the 17th, four on the 18th, three on the 19th, one each on the 21st, 22nd, and 23rd, and two on the 25th of the month. No less than twenty-eight really good chrysanthemum displays will be open to the public on Wednesday, Nov. 9th; these, of course, including two-day shows that opened the day previous; a similar number will be open on the 10th, counting the third days of the N.C.S., Highgate, and Birmingham; but on Thursday, November 3, there are thirty-two shows to choose from, provided one has not been visiting on the 2nd. Our list gives the dates of shows as wide apart as the Lizard and Aberdeen, Colchester and Carnarvon, London and Dublin, Dunfermline and Waterford, and comprises ten exhibitions of three days' duration, one hundred and nine lasting two days, and twenty-one that keep open but one day.

Fruit Growing in the Colonies.—It is stated in the circular recently issued by the Emigrants' Information Office that there is an excellent opening in the colonies for men with a little capital, who can take up land for fruit-growing, dairying, or general farming. In Ontario and the North-West of Canada free homesteads are given to settlers on simple conditions of residence and cultivation, the 160 acre grants in the North-West being open land, requiring no clearing. Western Australia is the only one of the Australasian colonies which gives free homesteads—the Free Homestead Act there dates from 1893, and has lately been much used; 562 of such farms, of an average size of 151 acres, besides 54 homestead leases, representing nearly 72,000 acres, were taken up in 1897. In the other colonies land (mostly uncleared) can be bought from 2s. 6d. an acre. But settlers must remember that the conditions of culture are necessarily very different from those they have been accustomed to here, so that they should not buy or rent land immediately on arrival, but should work for 12 or 18 months with some colonial cultivator till they have acquired experience of soil, climate, and other local conditions. If a man has a working family he could, it is stated, cultivate a ten-acre block for fruit-growing, without the expense of hiring outside labour.

Manures for Potatos.—An interesting competition for prizes offered by the Sulphate of Ammonia Committee, with a view to demonstrate the value of sulphate of ammonia in the cultivation of potatos, has been brought to a conclusion within the past few days. The competition was arranged in the Arbroath district, and there were originally eleven entries, but owing to the extreme drought and the disappointing nature of the crops seven withdrew. Competitors had to enter three acres, which could be treated with farmyard manure, phosphates of any kind, and potash, but the only artificial nitrogen had to be from sulphate of ammonia. The first prize was awarded to Mr. James Kydd, Scryne, with 15 tons 15 cwts. per acre; the second to Mr. John Brown, Peasiehill, with 14 tons 11 cwts.; the third to Mr. W. C. Swan, Inverpeffer, with 13 tons 11 cwts.; and the fourth to Mr. D. Morgan, South Mains, with 10 tons 17 cwts. Mr. Kydd grew the Bruce variety, and used sixteen loads of farmyard manure per acre in the drills, 2 cwt. of sulphate of potash, and 1 cwt. of sulphate of ammonia. Mr. Brown grew Up-to-date and Farmer's Glory, manuring with twenty loads of farmyard manure and 2 cwt. of sulphate of ammonia. Mr. Swan grew Up-to-date, and dressed with sixteen loads of farmyard manure on the stubble and 1 cwt. of sulphate of ammonia in the drills. Mr. Morgan grew Saxons, and applied sixteen loads of farmyard manure in the drills, with 2 cwt. of sulphate of potash and 1 cwt. of sulphate of ammonia.

Watering Window Boxes.—A very interesting case was heard in the Westminster County Court the other day in which the plaintiff sought to restrain the defendant from watering the plants in his window boxes in such a way as to annoy other tenants. It was stated by counsel, in opening the case, that defendant had seven years' lease at £180 a year of a flat on the fourth floor, with a frontage to Victoria Street and Prince's Street. He had a considerable number of windows, and in each of these windows was a box which was filled with flowers. He took a great interest in the flowers, and watered them copiously, so copiously that the water dripped on to the window-sills below and damaged the curtains when the windows were opened. When pastry and puddings were left on the table by the kitchen window these were soaked, and so was any linen that happened to be there. The Judge said it had been a very hot summer, and not likely to occur again, and considered it to be a case which should be settled. It was stated by counsel that defendant had tried to settle it, and had linings put to his boxes. In the result the case was adjourned with a view to some arrangement being come to by the parties.

Horticultural Exhibition at St. Petersburg in 1899.—From May 17 to May 27, inclusive, there will be held in 1899, at the Palais de la Tauride, St. Petersburg, the third International Horticultural Exhibition organised by the Russian Imperial Horticultural Society. At the same time the society also celebrates its 40th anniversary. The schedule we have received shows that the exhibition will be conducted on similar lines to those that obtain in Belgium, Germany, and France. It provides two hundred and ten classes, and in every instance the prizes are medals. These medals are of six grades, there being large, medium, and small ones, both of gold and of silver. Ten classes are provided for new plants, while there are ample sections for ferns, orchids, plants for dwelling-rooms, aroids, palms, crotons, and dracænas, conifers, cacti, bromeliads, hyacinths, tulips, amaryllis, lilies, azaleas, rhododendrons, roses, forced and preserved fruits and vegetables, models of horticultural buildings, garden designs, pottery, tools, heating apparatus, &c. One cannot find fault with the compilers of the schedule on the ground of lack of comprehensiveness. The foreign section will be under the presidency of M. A. Fischer de Waldheim, director of the Imperial Botanic Gardens of St. Petersburg; and Mr. W. Ender is secretary. As our readers have already been informed, Mr. James H. Veitch, Chelsea, has been appointed Commissioner for Great Britain and Ireland, and he will give any information required in connection with the forthcoming exhibition.

Berries of Daphne mezereum are generally considered to be poisonous to animals, but according to some recent correspondence in *Nature* birds eat these berries without fatal results. A Loughton gentleman wrote: From repeated observations in my own garden, I know that song-thrushes will eat ripe mezereon berries greedily. In the winter of 1896 they cleared a small bush containing, perhaps, two hundred berries, in the course of a week or two, returning at once when driven away, and becoming half stupefied; so that they might, apparently, have been caught with the hand. Dr. Withering states ("British Plants," ed. 1812) that six berries of this shrub (Daphne mezereum) will kill a wolf. Another correspondent, from Bedford, remembered a young blackbird, some years back, that used to frequent the garden of the house in which he was staying, and who eagerly swallowed the berries of Daphne mezereum. He was rather tame and would take the berries when thrown to him, following them as they rolled along the ground, as a chicken would go after peas. Sowerby confirms the ordinary opinion as to the poisonous nature of these berries: "The whole plant is a powerful irritant, both bark, leaves, and fruit acting poisonously if taken in large quantities. A few of the berries have been known to cause death when swallowed. The blackbird, however, did not seem the worse for them."

Experimental Horticulture.—A lecture on this subject was given by Mr. George Gordon at the meeting of the Royal Horticultural Society, over which Dr. Masters, F.R.S., presided. In the course of his lecture he pointed out that, in consequence of British horticulturists having in the past been so impressed with the importance of practical knowledge, the great value of experimental work had not been fully recognised. As the result of a want of appreciation of the utility of carefully conducted experiments there were now but few experimental stations in the United Kingdom, the most important being the gardens of the Royal Horticultural Society at Chiswick and the experimental orchards on the Madresfield Court and Woburn estates. Experimental plots and gardens had been formed by County Councils, and these, it was believed, would prove useful; but it was felt that they were too few to produce a distinct impression upon the advancement of horticulture, and he feared that an adequate return would not be obtained from them unless they could be brought into close touch with each other through the medium of some central body, such as the Royal Horticultural Society, to ensure carefully planned and systematic investigations and exact records. In contrast with the means available for the investigation of matters of horticultural interest in Great Britain, the liberal provisions made in America for conducting experiments were briefly alluded to. While we have a very limited number only of experimental stations, there are fifty-four stations in the United States, with a staff of about five hundred persons and an annual income of £678,000. The scope of the investigations at the American stations was referred to, and it was stated that much of the information available in this country on insect infestations and fungoid diseases had been obtained as the result of the activity on the other side of the Atlantic. Mr. Gordon urged the importance to British cultivators of a thorough investigation of the conditions under which the several fertilisers can be most successfully employed, under varying conditions of soil and climate, in the cultivation of the several fruit and vegetable crops; of plant diseases and methods of prevention, and of insect infestation and the most effectual remedies. The desirability of comprehensive trials of fruits and vegetables was suggested, and the opinion was expressed that to render such trials of the highest possible degree of utility the records must be more exact than has hitherto been the case, and that in the case of novelties a careful comparison should be made between them and standard varieties allied to them and grown under precisely the same conditions. The great need the Royal Horticultural Society has for a large experimental garden in the country, as supplementary to or in the place of the Chiswick Garden, was pointed out, as also was the necessity for co-operation of experimentalists, that investigations, which to be successful must be conducted under varying conditions, might be carried out. Suggestions for the improvement of existing varieties of plants were made, and asparagus and the blackberry were mentioned as possessing great possibilities. Sir John T. D. Lewellyn, Bart, M.P., said he was so deeply interested in experimental horticulture that one of his chief objects in coming to London on that occasion was to hear the lecture, which had given him much pleasure. The importance of experimental horticulture could not be overestimated, and as one proof of this he pointed to the great improvements that had been made in the potato. Several points in the lecture having been commented upon by Mr. A. Dean, Dr. Masters made some interesting references to the experiments that had been made at Chiswick, and pointed out that to carry out experiments on the lines suggested in the lecture the services of a director of experiments would be required.

A Bad Year for Fungi.—It is many years since mycologists have had such a disappointing season as that of 1898. Even the homely mushroom has been very scarce this autumn, and many a farmer who usually adds to his income by marketing this unsown (by him) crop will have to make good a deficiency by other means. Mr. G. Massee informed us a few days since that the fungus forays of this year in Yorkshire, Epping Forest, Burnham Beeches, and elsewhere, have proved singularly unproductive—and yet the chrysanthemum grower considers there never was such trouble with fungus as he has had this year.

Horticulture at Richmond, *Surrey*.—The Mayor of Richmond recently invited the committee of the Horticultural Society of that town to dinner, and the function was altogether a great success. Success to the society was proposed by the Mayor, and responded to by Mr. Skewes-Cox, M.P., for sixteen years past chairman of the society, and Mr. Algernon Chancellor, hon. secretary, and son of the Mayor. Mr. Chancellor stated that the society had never been in a more flourishing condition, both financially and otherwise. No less than fifty-five new guinea subscribers had added their names to the list last year. Sir Henry Irving's three guinea subscription showed that people outside as well as in the borough appreciated it. The last show had been the best and largest of the series. He was sorry that the cup given by his father and mother for roses had not been retained in Surrey, but had gone to Colchester; but he hoped that others might be offered. Regretting deeply the death of the Duchess of Teck, he hoped that the Duke of Teck might be able to be amongst them next year. He returned thanks to the many contributors to the prize list, and expressed his belief that the Richmond society would soon pass the Royal Horticultural Society.

The Famous Thorn Tree of Prestonpans suffered considerable damage during the storms of last week, a large limb being broken off about nine feet from the ground. It was near the tree that Colonel Gardner received his fatal wound at the battle of Prestonpans in 1745. A few years ago a limb was wrenched from this old thorn by the fury of the elements, and so, to preserve it, Lord Wemyss had each limb girt with a strong iron band and the whole connected with steel wire; the strain of the recent gale, however, proved too much for even such supports, and now there is one more limb the less.

Local Horticultural Societies.—The horticulturists resident in the Hornsey district are somewhat perturbed by the question as to whether or not it is desirable to establish a dahlia society at Hornsey. We are much gratified to find that so much interest is taken in the cultivation of dahlias in the north of London, but having regard to the fact that there is already a horticultural society in the village we are strongly of the opinion that some effort should be made to combine a display of dahlias with the exhibitions of the existing society. The multiplication of small societies is undesirable because of the heavy outlay involved in proportion to the amount of work accomplished. One strong society in a district has an opportunity of contributing to the advancement of horticulture, but several small societies can do but little to encourage cultivators, and the continuous canvassing for subscriptions has, in many instances, the effect of inducing gentlemen to refrain altogether from contributing to the funds of horticultural associations. In commenting upon the question at issue the *North Middlesex Chronicle* very properly observes, "The Hornsey Horticultural Association covers very useful ground, and it would be well for all interested in horticulture to confine their attention and interest to this society. It needs help in more than one respect, and almost entire reorganisation, in order to avoid a repetition of the recent regrettable result of the prize distribution. If everybody would unite in the matter the Horticultural Society would go ahead with a swing, and a dahlia society could be formed when the necessity arose. There is more need at present for assistance to the existing society than there is for the establishment of another association."

Junipers from the West Indies.—Dr. Masters recently exhibited some specimens of a juniper, native to Jamaica, which he had received through the kindness of Mr. W. Fawcett, the Government botanist of the island. This species had been referred to the J. burmudiana of Linnæus, with which J. barbadensis of the same author is taken to be synonymous. On comparison the Jamaica juniper is seen to agree very closely with J. virginiana, the so-called Red Cedar of the mainland of North America from Canada to Florida. This species furnishes the best "cedar" wood for pencils, and many forms of it are cultivated in English gardens. The resemblance of the Jamaica plant to the American is so close that Dr. Masters does not hesitate to include them both under the same name of J. virginiana.

Lee and Blackheath Horticultural Society.—This society has in accordance with its usual custom arranged a series of meetings for the reading of papers and discussion during the autumn months. The programme is as follows: October 28, "Garden Roses," Mr. George Gordon; November 25, "Mistakes in Gardening," Mr. T. W. Sanders; December 23, "Chrysanthemums," Mr. E. Dove; January 27, "Artificial Manuring," Mr. E. O. Greening; February 24, "Herbaceous Calceolarias," Mr. James Martin; March 24, members' night for discussion.

Herr Ernst Virchow, a son of Professor Rudolf Virchow, has been appointed director of the Royal Gardens at Wilhelmshöhe.

Orchard and Small Fruits.—A new instalment of the agricultural returns for the current year includes the acreage of orchards and small fruits. From the returns we learn that the area under orchards in England is 220,220 acres, against 218,261 for 1897; 3,690 acres in Wales, against 3,707; 2,149 acres in Scotland, against 2,148; and 226,059 in Great Britain, against 224,116. Of small fruits there are 63,438 acres for England, compared with 63,535 in 1897; 1,044 acres in Wales, against 1,043; 5,271 acres for Scotland, against 5,214; and 69,753 acres for Great Britain, against 69,792 in 1897.

Forestry at the Cape.—Mr. D. E. Hutchins, conservator of forests at the Cape, has been showing how great a need there is for an extension of the area at present under forests in the colony. While the colony has produced £100,000 worth of fruit during the past two years, it has, during the same period, imported not less than £269,349 worth of timber, and yet almost the whole of such an amount could be produced in national forests 50,000 acres in extent. He shows that in many places where agriculture is difficult or impossible forests might do well, as instanced by the richly-wooded slopes of the lofty Amatolas, the similarly beautiful forest with its gigantic yellow-wood trees in the barren Knysna country, and, perhaps most striking of all, the cedar trees of Clanwilliam, growing on the absolutely bare rocks of the stupendous Cedarberg Range; while at Genadendal an introduced tree, the Cluster Pine (*Pinus pinaster*), hardier than any of the indigenous trees, is spreading itself self-sown up the rocky mountain-side, in spite of fires, drought, hot winds, and climatic vicissitudes, that are too often the despair of the agriculturist. By means of comparison Mr. Hutchins indicates clearly the position of Cape Colony in relation to other countries with respect to forest area, giving the acreage under forest in each country, followed by the percentage under forest of the total area of each country. The figures are: European Russia, 527,427,000 acres, or 42 per cent.; Sweden, 42,366,000 acres, or 42 per cent.; Austria, 46,856,000 acres, or 31 per cent.; Germany, 34,350,000 acres, or 26 per cent.; Norway, 18,920,000 acres, or 25 per cent.; India, 140,000,000 acres, or 25 per cent.; France, 20,750,000 acres, or 16 per cent.; Portugal, 1,666,000 acres, or 5 per cent.; Great Britain and Ireland, 2,790,000 acres, or 4 per cent.; Cape Colony, 353,280 acres, or 0·29 per cent.

Messrs. J. Laing and Sons have been awarded a diploma and gold medal for the display of flowering and other plants they have made at the Earl's Court Exhibition during the past season.

The New Addition to Epping Forest.—Yardley Hill, recently added to Epping Forest through the generosity of Mr. E. N. Buxton, is about twenty-eight acres in extent; it is a timbered ridge projecting into and commanding a fine view of the Lea Valley. Chingford station is the nearest point to Yardley Hill by rail, but the road passing through Chingford to Waltham Abbey skirts the estate on the east side. Davis Lane links the addition to Bury Wood, while Gillwell Lane connects it with Sewardstone Green. The letter to the Lord Mayor in which Mr. Buxton makes the gift to the City Corporation is as follows: "I have for a long time past been impressed with the importance (if not the necessity) of securing the picturesque vantage ground known as Yardley Hill as an addition to Epping Forest. It is a timbered ridge which projects into the Lea Valley basin, from which river its highest point is distant about four hundred yards. From its prominent position it commands many miles of the valley, along which a manufacturing population is steadily assembling, as well as such distant points as Hampstead, Barnet, and the high ground near Broxbourne. A more practical consideration is that it would connect that charming outlying portion of the Forest called Gillwell Lane—at present, owing to its isolation, rarely visited—with the main block near Hawkwood. My efforts, more than once renewed, have at length been successful, and I have now the pleasure of offering your Lordship, as Chief of the Conservators of Epping Forest, to accept twenty-eight acres of this land for the public use. In making this offer may I once more express to the Corporation over which you preside my abiding gratitude for their spirited action in the past, and my confident hope that, in conjunction with residents, upon whom a duty also lies, they will lose no reasonable opportunity in the future to consolidate, extend, and complete the precious inheritance of which they are trustees."

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

I HAVE an announcement to make this week which will, I feel sure, afford much satisfaction to readers of this paper. Peter has been induced to take up the question of chrysanthemum rust. Knowing that in a matter of current interest such as this no expense ought to be spared I acceded to his request for a few days' holiday, and the amount of a bicycle hiring, and despatched him Londonwards. His gyrations on the bicycle were not a bit more amusing than Mr. Riddell's among the roots, but they were far more destructive, particularly in the case of a heavily laden furniture van that was thoughtless enough to get in his way and suffered for its neglect. However, he duly reached St. Stephen's Hall, and once there my knowledge of him tells me that he must have made his presence felt in a very singular degree.

When Peter returned he was labouring under the weight of a great secret, and so much did it engross him that I had some difficulty in getting him to discuss the rust at all. Eventually, however, he unbosomed himself. "Now, the first thing about this rust," he began, "is that them there chaps don't know anything at all about it. What do you think most of them was doing when they was talking? Why nothing no more than saying a lot to hide what they didn't know. Now——" But here I interrupted. "Remember, Peter, that it is the rust and not the root critics you are discussing. I fear you are confusing the two." "There is a bit o' confusion about, I must confess," returned Peter, grimly. "There's the name for one thing. It seems to me as there's an idea about in some quarters—for they talks in a fatherly way of having started the MAGGIEZEEN on it—that it won't do to have a name given in our paper, but they must find another. Now I can tell you the name o' this rust. It isn't Journalia Abbeyi, nor yet it isn't Maggiezeenia Masseei. It's Hardbrediana Peteri."

My excellent but erratic helper surveyed me with much complacency as he propounded this startling suggestion. It evidently afforded him very great satisfaction. Perceiving an enigmatical something in his manner, I patiently awaited the continuation of his remarks. "There's a lot o' people," he resumed, "who'd never understand the meaning o' that name. I was going to get up and tell 'em it at the Aquarium, and then I thought to myself, why, poor chaps, they'd not like me to show 'em all up afore their friends, so I won't. But that's it, sir, right enough." "And Hardbrediana, I suppose, conveys, Peter, that ——" "Of course it does; nothing else. There's these people been a-doing nothing but a-breeding and a-cross-breeding the chrysanthemums till they've knocked the constitution out of 'em, same as they did with potatos an' hollyhocks, and same as they will with dahlias before they've done. You mark my words. Well, now they've done it, what do they do? Why, they start arguefying about names, an' one recommends a wash which another says is no good, and so they go on, one a-contradicting the other. All the lot of 'em won't do any good till they give the plants the constitution they've been a-robbing them of, an' that's all I've got to say about rust."

As I am well aware that it is useless to argue with Peter when he comes to the decision that a subject is closed, and as I perceived that he was still oppressed with his secret, I changed the subject in order to give him an opportunity of unbosoming himself. He was, however, wary. I have reason to believe, notwithstanding this reserve, that there is serious risk of my losing him. Strange as it may appear, this is closely connected with the recent leader on the future of the N.C.S. I gather from his guarded hints that he has been approached with a view to ascertaining whether he would, in case of certain eventualities, interest himself actively in organizing exhibitions at a great place of entertainment in London. What can this mean but that the directors of the Royal Aquarium mean to run a society and shows of their own if the N.C.S. packs up and departs? With Peter as sub-manager things would certainly boom. But think, gentlemen, what it means. Two "national" societies and two "national" shows. Can both succeed? It is as plain as a pikestaff that cleavage is in the air, and only the most wise and resolute diplomacy can unite the disunited. Who is to be the Chrysanthemum Bismarck?

If there is no error in the report, our onion champions are making still further headway. On page 676 we are told that Mr. Fife exhibited twelve Lord Keeper weighing 30¼ lbs. That, of course, means 2½ lbs. per bulb. I had no idea that the variety (a semi-flat one) could be grown to this enormous size. It has not the physical advantages of Ailsa Craig, and if it has really been produced of the same size as that more globular variety Mr. Fife has achieved a remarkable triumph. If he gets them much bigger than this we shall have a drum and fife band of a new sort. Where, however, is Mr. Bowerman? Is he retiring from the field of battle, and leaving the fray to younger bloods?

In reading the report of Mr. J. Wynne's paper on exhibition vegetables (page 676) I was struck by the coincidence of his taking up the very crop which Mr. Riddell and I have been sparring about for the purpose of suggesting root mutilation as a means of hastening growth, viz., celery. Partially relifting the plants, and breaking off some of the roots, will, he says, often spur on sluggish celery. I haven't tried it, but I fancy sewage would help on this result. A good many people have had neither water nor sewage this season, and it is therefore quite open to Mr. Wynne to retort that his plan is the more practicable, since you can't apply liquids if you don't possess them, while it is always possible to make a raid on the roots.

This root question is full of interest, and Mr. Riddell throws some new and weird light upon it. He scouts my idea of food creating roots. We have all read of the root that went twenty or thirty yards to a wall, climbed the latter, passed through a hole, and went straight to some decaying matter. And some misguided and obscure scientists (I am not sure whether one Charles Darwin was not of the number) have been so crassly ignorant as to suggest that the food drew the root, the latter being—to speak practically and without quibbling—created by the former. But it was a knowing root, a wary root. It was just fooling the scientists. What really happened (see Mr. Riddell) must have been something quite different. No doubt, the root "created" the food in some quiet corner, and carried it through the wall to a secure hiding-place—just as a dog will take away and hide a succulent bone. How that hoary-headed impostor of a root must have laughed at us all till Mr. Riddell came along and showed it up!

I must thank Mr. Riddell for giving to the world in general so accurate a description of, and to me in particular, so excellent a weapon about trees in undug soil. The very best that he is able to claim for them is "growth short and small, fruit scanty and under the average size." A truly tempting picture, is it not? Something admirably calculated, we must all agree, to stem the tide of foreign fruit. No matter that the digging and cultivating system gives the healthiest of trees and the most magnificent of fruit, we must still cling to worn-out theories and leave the soil alone. When I read about Mr. Riddell's hundreds of ruined trees I could not help thinking of a certain summer day when our editor took me to see some southern orchards, and one, above all, which has been often talked about from the splendour of its produce. This orchard is annually dug and surface cultivated, and the "mutilated" specimens were pictures of health and laden with superb fruit. "Growth short and small, fruit scanty and under the average size." This, then, is the ideal set up for growers in Britain. Mr. Riddell has given his case away.

LUX.

NEW PLANTS AND FLOWERS.

LÆLIA PUMILA COLMANI.

A fine form with almost pure white sepals and petals and a violet-purple coloured apex to the white-tubed lip. The flowers measured just over five inches across and have a white stripe down the centre of the apex of the lip. A.M., R.H.S., October 25. Mr. W. King, gardener to J. Colman, Esq., Gatton Park, Reigate.

LÆLIA PERRINI LEUCOPHÆA.

A handsome and distinct form of this popular winter flowering orchid. The flowers are very broad, the sepals and petals being of a pale lilac shade. The lip has a long, white tube and white throat, but a deep reddish-rose apex. A.M., R.H.S., October 25. Mr. W. H. Young, grower to Sir F. Wigan, Bart., East Sheen.

CHRYSANTHEMUMS.

Soleil d'Octobre, a fine early-flowering, golden Japanese chrysanthemum, already described. A.M., R.H.S, October 25. Mr. H. J. Jones, Lewisham; and Mr. J. Hudson, Gunnersbury House Gardens.

Golden Queen of the Earlies, a bright yellow-flowered sport from the well-known Queen of the Earlies, and quite as valuable for decoration and market work. A.M., R.H.S., October 25. Mr. H. J. Jones.

Nellie Brown, a most useful early-flowering, decorative variety, making bushy plants covered with bright, bronzy-orange flowers. A.M., R.H.S., October 25. Mr. W. Wells, Earlswood; and Messrs, H. Cannell and Sons, Swanley.

Baronne de Veillard, a large incurved chrysanthemum of a soft bronzy-buff colour; the inner surfaces of the florets are deep crimson. A.M., R.H.S., October 25. Mr. W. J. Godfrey, Exmouth; and Mr. R. Owen, Maidenhead.

Major Matthew, a small-petalled but large-bloomed incurved variety of a soft but not over bright rosy-mauve colour; inner surfaces purple. A.M., R.H.S., October 25. Mr. W. J. Godfrey, Exmouth.

Ettie Mitchell, a useful decorative variety with pretty yellow flowers faintly streaked with scarlet and so giving an orange effect. A.M., R.H.S., October 25. Mr. W. J. Godfrey, Exmouth.

Mrs. W. Seward.—A large, finely-built Japanese, and, like many of Mr. Seward's seedlings, very rich in colouring. It is deep in build, the florets are flat and of good substance, and very regularly arranged. The colour is deep rosy-cerise, with a reverse of gold, and the florets are tipped an edged gold. F.C.C., N.C.S., October 24. Mr. W. Seward, Hanwell.

Market White.—Decorative Japanese. A pretty little flower; colour pure white, tinted sulphur in the centre. F.C.C., N.C.S., October 24. Mr. W. Wells, Earlswood.

Jules Mary.—A decorative Japanese; florets narrow, stiff, and neatly disposed; colour deep bright crimson, reverse golden; very effective. F.C.C., N.C.S., October 24. Mr. W. Wells.

Mrs. W. Cursham.—This is another of the big battalion. The florets are broad and deeply grooved, twisted and intermingling, and curly at the tips; the ground colour is white, shaded pale lilac mauve. F.C.C., N.C.S., October 24. Mr. W. Wells.

Mrs. Wingfield.—A very pretty decorative Japanese, and something resembling the Christines in form; colour deep bright pink. F.C.C., N.C.S., October 24. Mr. W. J. Empson, Ampthill.

Ada Owen.—A very nice looking, regularly built incurved, close and compact; florets broad and stiff; the blooms are of good size; colour pure white. F.C.C., N.C.S., October 24. Mr. R. Owen, Maidenhead.

Lady Phillips.—An incurving Japanese, big, bold, and solid; florets very broad; colour pale mauve, with a reverse of silvery pink. F.C.C., N.C.S., October 24. Mr. R. Owen.

Mrs. George Hill.—A pretty little decorative Japanese, with white drooping florets, centre shaded yellow; very free and useful. F.C.C., N.C.S., October 24. Mr. H. J. Jones, Lewisham.

President Bevan.—Japanese incurved. A big mauve flower of exceptional build; florets grooved and pointed; colour deep golden-yellow, shaded bronze. F.C.C., N.C.S., October 24. Mr. W. Wells.

Major Matthew.—Incurved; rather narrow florets, but closely incurving; a globular, well-built, medium-sized flower; rich rosy-pink. F.C.C., N.C.S., October 24. Mr. W. J. Godfrey, Exmouth.

CEROPEGIA WOODI.

A quaint little climbing plant with pairs of heart-shaped leaves, silver variegated, and small white flowers tipped with crimson. B.C., R.H.S., October 25. Mr. W. Bull, Chelsea.

HYBRID MONTBRETIAS.

THE flowers commonly known as hybrid montbretias, which would more correctly be called hybrid tritonias, have lately been the subject of a good many notes in gardening papers. They were most of them raised by Messrs. Lemoine, of Nancy, from a cross between Crocosmia aurea and Tritonia Pottsi. He now offers upwards of thirty varieties. That they may be very ornamental when well grown seems to be generally agreed, but there is one statement about them concerning which a timely warning should be attended to—the statement that they are perfectly hardy in the open border. The cultivation of these bulbs is in most gardens comparatively recent, and gardeners speak of their experience of the last three or four unusually mild winters. Besides this, the term "hardy" should always be qualified by defining the county or soil of which it is spoken, otherwise it may be very misleading. I began the cultivation of these hybrid tritonias more than ten years ago, having had a longer experience of both the parents, neither of which I have ever found quite hardy in severe winters without protection. When I first dealt with Mr. Lemoine I asked him his experience of the hardiness of these hybrids. He told me that none of the hybrids, and neither of the parents, were hardy in the open ground at Nancy without a thick coat of litter on the surface during the winter. The winter of Nancy is, it is true, more severe than that of England; but most of us who grew these bulbs before the beginning of 1892 know that all of them that were left in the open ground unprotected were killed outright by that winter, except in warm and favoured situations; and they will always be killed by three weeks of continuous frost where the ground is frozen hard to the depth at which the bulbs are growing.

But hybrid tritonias are so very easily dealt with in such a way as to exclude danger of losing them by frost, that it is not worth while to run any risk in the matter. Even when winter spares them, many of the kinds, especially the type T. Pottsi and T. crocosmiæflora, increase so rapidly, that if left to themselves for more than two years they exhaust the soil and strangle one another, and produce a dense forest of leaves with little or no flowers. Some amateurs to whom I have given them have been so alarmed at their rate of spreading as to dig them all up and consign them to the rubbish heap. But there are several ways of dealing with them by which the increase may be checked, and the flowers made very ornamental in the mixed flower border.

It is the habit at Edge at any time before the ground is frozen deep, say about the middle of November, to get together a hundred five-inch or six-inch pots, and, digging up the clumps, to put three or four bulbs in each pot, which may be filled with any refuse soil, and well watered. Then they may be put away under the trees in any shrubbery or waste ground, and covered two feet deep with any light litter which will neither heat nor blow away. They should have all the rain the sky gives them, for it may be noted that they cannot stand drought, either when growing or at rest, as they belong by nature to rather wet ground. Any attempt, therefore, to store them dry during winter like the corms of gladiolus, will end in their certain death. As for the large number of surplus bulbs, it is well to reckon for how many bunches room can be found; if more are wanted than the number of pots filled, it is very easy to save the surplus by burying them in any waste corner, and littering them over to exclude frost. None should have the tops cut until replanted in March. At the end of that month they are safe from damage by frost. Those in pots are then planted in rich soil which does not dry up, about six or eight inches deep. The buried clumps may then be divided, so that each new clump has not more than eight or ten growing points. It is better, however, to throw away thousands than to plant or leave any crowded clumps. Treated in this way, they begin to flower early in July, and continue until late in October.

It will often be found, some varieties being far worse than others in this respect, that whole clumps turn brown and wither prematurely before all the flowers are open. I cannot assign this to any preventable cause—either soil or situation, or too much or too little water—but I conclude that these bulbs will not ripen well for next year, and throw them all away. The best soil is rich, open loam, and the best situation sunny, but partly overgrown by dwarf shrubs, so that the surface of the soil does not get burnt. If grown entirely in the shade, though they make luxuriant leaves, they do not flower; and, however fine these bulbs look when dug up, they require a season's growth in sunshine before they consent to flower again.

As for the varieties, upwards of thirty in number, most of which I obtained from the raisers soon after they were first offered, the commonest, next to the type Tritonia Pottsi, is called crocosmiæflora. These increase so rapidly as to tempt the grower to consign them all to the rubbish heap, but there are great improvements on both these being of the same colours, and moderate growers. For the first of them, Etoile de Feu, has the same scarlet flowers of larger size, and increases very moderately, and has a very good constitution, seldom withering prematurely. Instead of the other, I should recommend Bouquet Parfait, a fine shaded orange, and equal in constitution to any of the set. For a dark yellow, I find Aurore possesses the same desirable qualities as the others recommended, and Pluie d'Or, as a lighter yellow, equally good. The palest in colour is Solfaterre. These five represent the most distinct contrasts of colour, and make a very good selection. There is a small flowered variety exactly like T. Pottsi in size, but having the inside of the flower bright yellow and the outside scarlet. It does not spread like its namesake. It is called Pottsi grandiflora, an unsuitable name, as the flower is smaller than any other of the hybrids.

In recommending the above treatment and varieties, I speak entirely from my own experience. Other cultivators, where the soil and conditions are different, may perhaps have a different story to tell. Here they thrive in retentive, rich, well-worked soil. I must not conclude without speaking of two very fine flowers of which the treatment is nearly the same, and which are generally associated in catalogues with so-called hybrid montbretias. They are named Crocosmia imperialis, and C. maculata, and are both, I believe, varieties of the old C. aurea, which has for long been in cultivation as Tritonia aurea. Their flowers are twice as large as any of those described above; they are produced rather later, and the bulbs are perhaps rather less hardy. They increase more sparingly, making flowering stalks at the end of stolons a foot or more long, so that if left in the soil they do not make a compact bunch. For this reason it is more difficult to protect them against frost unless they are taken up and potted, a plan I generally adopt. They are excellent for greenhouse ornaments in September and October. In lifting them to pot great care must be taken not to break off the long shoots, of which there are seldom more than two or three to each bulb. They are very fragile, and, if broken, no fresh growth is sent out, and the bulb is useless. In potting, the points of some of the shoots should be brought to the centre of the pot, and not all be left to grow up against the rim.

Edge Hall, Malpas. CHARLES WOLLEY DOD.

VINE CULTURE IN THE OPEN.

"R. D." DOES well to call attention to this matter. Vines are mostly worth growing on houses, walls, and up trees, both as foliage and flowering plants. For fragrance, fineness, and, in many cases, colour of foliage, we have few equals and no rivals to grape vines. Several of our grapes, such as Alicante, West St. Peter's, Barbarossa, Madresfield Court, Lady Downes, &c., colour their foliage, though they may not ripen their fruit in the open air. Then two of the hardiest vines and grapes for the open air—and these will ripen freely in the south and east of England without the help of walls—are Miller's Burgundy (or the Dusty Miller) and the Claret, the leaves as well as the fruit of the latter being dyed a deep purple. These are two of the best and hardiest vines, and grown in the open like raspberry canes, in rows a yard apart, or as dwarf standards or cordons about eighteen inches or more from plant to plant, alternate rows of these two varieties give vivid pictures of purple interleaved with silver. Among hardy vines these two grapes are also good wine makers. The Dusty Miller takes its name from the mealiness of the leaves, rather than the bloom of the grape, though the latter is supposed also to add to the piquancy of the grapes and their resulting juice. Though the leaves are so densely covered with down as to be always white during most of their growth, the grapes finish off a deep dark colour, distinguished not only by the depth and density of their bloom, but the excellency of the small berries for eating, and the rich bouquet of their wine.

The Black Cluster is not seldom confounded with the Dusty Miller, though readily distinguished from it by the absence of mealiness on the leaves, and the larger bunches of berries. It is, however, an equally hardy and good grape for the open air, on walls, and is perhaps the most popular vine on the Moselle or the Rhine as laying the foundation of the finest brands of burgundy or champagne wines. The Claret may be best described as purple all over, and therefore it is recommended in the open, and on walls, alternately with Dusty Miller and Black Cluster, and, as a contrast to both, the Parsley-leaved Muscadine. This vine is about as deeply laciniated in the leaves as is the Cut-leaved Bramble (*Rubus laciniatus*), while the variety is as hairy as the common White Muscadine or Sweetwater. There is also a Black Sweetwater and Black July. The Espiran is the largest and perhaps most certain of all our hardy grapes for walls. The Cambridge Botanic Garden is another hardy black grape, which forms an excellent companion to the Espiran on warm walls. The Black July bears small grapes, full of refreshing juice, fit for eating or the press. The Purple Fontainbleau, as well as Black Prince, Black Hamburgh, and Black Sweetwater, will also often ripen in sheltered gardens on warm walls.

Among white grapes, the delicate, sparkling Chasselas Musqué, Chasselas Vibert, also the Frontignans, white, black, and grizzly, have been perfectly ripened on warm walls. There is one very noticeable and encouraging feature that has distinguished most, if not all, the attempts made to grow Frontignan grapes in the open air on our walls. Under cool treatment the grapes have neither shanked nor shrivelled, and the flavour has equalled, or excelled, those grown in heat. The Early Saumer Frontignan, as its name implies, ripens earlier than any of the others, but the Grizzly, alike out of doors as in, is the highest flavoured. Other white hardy grapes well worth growing are the Scotch White Cluster, Stillward's Sweetwater, perhaps the hardiest and freest setter of all the Sweetwaters; The Early Smyrna, and the Early Malvasia. These and others may yet be met with in various parts of the country.

Our hardy vines are however, greatly in need of rigid selection as well as improved culture. Some years since there was a considerable run on hardy American vines, as well as for bigger blackberries, and with little more successful results. If County Councils would use their influence to bring these out-door grape vines under the notice and management, for a year or two, of their horticultural lecturers, the character of the grapes and the quality and quantity of the wine produced might speedily be enormously improved. Improved varieties would do much, but rational treatment and youthful vigour might do more in both directions, for with a few rare and notable exceptions, which only prove the rule, the worst treated plant in all the garden or orchard is the grape vine. Too generally it is a mere crush of fruit, foliage and shoots, allowed to run wildly to waste instead of being planted, trained and cultivated into a thing of plenty and of beauty, and a joy for a generation, if not for ever, for the entire family. Sweetness and beauty the vine cannot help giving, but the amount of pleasure and profit it will yield to its possessor depends upon the care, the skill, and the love of the cultivator. D. T. FISH.

HOMOLOGY OF PLANTS.

By Professor F. O. Bower, D.Sc., F.R.S

(Concluded from page 684.)

Dorsiventrality.

INTERESTING questions arise in connection with dorsiventral structure. In the Equisetineæ, and almost all Lycopodineæ, the strobilus is of the radiate type, therein corresponding to the radial structure of typical sporogonia. While certain ferns are of the radiate type, others are conspicuously dorsiventral, even from their earliest embryonic state. Dorsiventral structure also appears in the vegetative region, and sometimes, though rarely, in the strobilus of *Selaginella.* Professor Goebel, in a chapter of his "Organographie," the publication of which may be recognised as the leading event in the morphological studies of the year, discusses the origin of the dorsiventral state in a number of examples, and his results have a most interesting bearing on our theory of the strobilus.

He shows in the case of *Vaccinium myrtillus* how the first shoot of the seedling is orthotropic and radial; the lateral shoots, formed after the apical growth of this is arrested, are also orthotropic, but the lateral shoots of higher order become plagiotropic with leaves in two lateral rows. He points out the intermediate steps from one condition to the other, and how finally the growing point itself is influenced by the external agency (apparently light), which leads to a change of the leaf arrangement. This seems to be the case in many other Phanerogamic plants.

A particularly interesting account is also given of similar changes in *Selaginella.* Some eight species are orthotropic, radial, and isophyllous. *S. sanguinolenta* shows a direct response to external conditions, being upright and isophyllous in bright and dry situations, plagiotropic and anisophyllous in damp and shady situations. The bulk of the genus are, however, either plagiotropic and anisophyllous throughout, or some may have an early orthotropic stage. But he concludes that even in "habitually" anisophyllus *Selaginellas* we have to do with an adaptive character, induced probably by light.

We see then good evidence that in certain cases the dorsiventral shoot is a result of adaptation, and the radial probably the primitive. Was this always so? We need not discuss the case of the gametophyte, as the problem there is even more varied and difficult, and does not at the moment engage our attention. But the question whether in the sporophyte the radial was in all cases the primitive type is clearly related to our theory of the strobilus. The sporogonia of Bryophytes are, with few exceptions, orthotropic, and almost uniformly radial; exceptions, such as *Diphyscium* and *Buxbaumia* have been shown to have an interesting relation to the incidence of light, and are readily recognised as derivative. The distinctively strobiloid Pteridophytes mostly maintain this radial structure; this may be so both in strobilus and vegetative organs, as in *Equisetum*, *Isoetes*, in most species of *Lycopodium*, and in some *Selaginellas*; or the vegetative region may be dorsiventral, and the strobilus return to the radial type, as in some species of *Lycopodium* and most *Selaginellas*; but in some *Selaginellas* even the strobilus may be dorsiventral.

In the Ferns the case is less obvious; the large size of the leaves, combined often with a dorsiventral structure of the shoot, makes a comparison with a radial strobilus less easy. Goebel has pointed out that in many dorsiventral Ferns the dorsiventrality is already defined in the *punctum vegetationis*, and does not depend upon a subsequent shifting of the parts. But it should be remembered how many Ferns are orthotropic and radial; that almost all the large genera include species with simple unbranched leaves. Further, the series of the Ophioglossaceæ, possibly a distinct phylum from the true Ferns, may be held to illustrate a progressive elaboration of the leaf, from smaller-leaved forms which are orthotropic and radial, to larger-leaved forms, which are sometimes orthotropic and radial (*Botrychium*), sometimes plagiotropic, and dorsiventral (*Helminthostachys*). It is not, I think, improbable that these, and also the true ferns, are referable in origin to an orthotropic strobiloid type, with radial structure. This opinion was in substance suggested in 1894 at Oxford; these recent observations of Goebel on the derivative nature of dorsiventral shoots strengthen the position then taken up, while they supply us with fresh examples of homoplastic development.

Conclusion.

This discussion was entered on with a view to finding whether phylogeny as a basis of morphology would lead us. However unprepared we may be to pursue it with certainty into detail, or to apply a terminology to the sequences which we recognise, we must, I think, accept phylogeny as the natural basis for morphology. I do not think that any middle course between this and an artificial system is possible or reasonable. But here we launch ourselves upon a sea of uncertainties on which we must keep our course with care. Following it, we think we espy certain great movements in Nature. We may recognise what we believe to be a true evolutionary sequence, but who is to say whether it is a progressive or a retrograde sequence? It may even be one divergent from some middle point. Our best friend may read the sequence in opposite order to ourselves and arrive at a diametrically opposite conclusion. There is no finality to this judging of probabilities, a fact which should be always before the mind, especially in the warmer moments of discussion.

It is interesting to trace the parallel between the progress of classification of plants as a whole, and that of the classification of their parts. In each case the earlier symptoms were artificial. We may compare the Linnæan system of taxonomy with the Hofmeisterian organography; in both the rigid application of a preconceived method placed incongruous things in juxtaposition, in each case a widening of the basis of the classification has resulted in a redistribution on more natural lines. The present ideal of taxonomy is the same as that of the phylogenetic organography, viz., to group according to descent. The limitations are alike: systematists and morphologists both find their greatest difficulty in the incompleteness of the record, and the frequent isolation of the things to be classified.

But, without following the obvious parallel further, we may now briefly review our position as regards organography, and the following categories are to be recognised, though they graduate almost imperceptibly into one another:—

Homogeny.—(*a*) *Repetition* of the individual part in successive generations, with the same number and position. This is exemplified by the cotyledons, the foot, and the first root.

(*b*) *Essential correspondence* of parts varying in number and position, but corresponding in character and development, produced in a regular sequence; *e.g.*, most cases of continued embryology.

(*c*) *Transferred position* of parts, similar in origin and structure to those produced in regular sequence; *e.g.*, roots, adventitious buds, sori of *Aspidium anomalum*, aposporous and apogamous growths, many monstrosities; these we may believe to result from a transfer of inherited developmental capability.

Homoplasy.—This may be recognised with varying degrees of probability; starting from cases where the question of community of descent is open (as with nearer circles of affinity), and proceeding to those in which distinct evolution is virtually certain. It remains for future investigation to clear up doubtful points. Meanwhile, taking the case of leaves for the purpose of illustration, we may contemplate the following possibilities:—

(*a*) A possible origin of two homoplastic series of leaves in the same plant, and the same generation (*Phylloglossum*).

(*b*) Two homoplastic series in the same plant, but in different generations (*Lycopodium cernuum*).

(*c*) A possible distinct origin of homoplastic leaves in distinct phyla, but in the same generation (sporophyte of Ferns, Lycopods, Equiseta).

(*d*) A distinct origin of homoplastic leaves in distinct phyla, and distinct generations (*e.g.* leaves of Bryophyta and of Pteridophyta).

Now *Homology* has been used in an extended sense as including many, or even all, of these categories. It seems plain to me that this collective use of the term homology carries no distinct evolutionary idea with it; it indicates little more than a vague similarity; the word will have to be either more strictly defined or dropped. The old categories of parts based upon the place and mode of their origin are apt to be split up if the system be checked by views as to descent. Comparison, aided by experiment, supersedes all other methods, and the results which follow raise the question of terminology of parts which have arisen by parallel development.

In parts which are of secondary importance, such as stipules, pinnæ, the indusium, hairs, glands, the inconstancy of their occurrence points to independent origin by parallel development in a high degree; in parts of greater importance, such as leaves, a parallel development may also be recognised, though in a less high degree; in the case of sporangia their acceptance as a category *sui generis* dispelled the old view of their various origin from vegetative parts; but we must remember that this does not by any means exclude a parallel development also in them, by enlargement and septation from some simpler spore-producing body, though this is not yet a matter of demonstration. Finally, the sexual organs are probably homogenetic in all Archegoniate plants, but we have no proof that sexuality arose once for all in the lower plants; the probability is rather the contrary. Thus we may contemplate as very general a polyphyletic origin of similar parts by evolution along distinct lines, but resulting, it may be, in forms essentially similar.

There are two extreme courses open to those who wish to convey clearly to others such matters as these: the one is to use a separate term for each category of parts, which can be followed as maintaining its individual or essential identity throughout a recognised line of descent—in fact, to make a polynomic terminology of members run parallel with a polyphyletic development; the other course is to make it clear always in the use of terms applied to parts that they do not convey any evolutionary meaning, and to use them only in a descriptive sense. Perhaps the former is the ideal method, and it may be a desirable thing, as polyphyletic origins of parts become more established, that the terminology should be brought to reflect at least the more important conclusions arrived at. How this may be done we leave for the future to decide, though I have indicated a first step in the case of the leaves of Mosses and Ferns.

But, for the present, the whole matter is still so tentative that it is well to be content with something which falls short of the ideal, and to maintain the usual terms, such as stem, leaf, root, hair, sporangium, &c., as simply descriptive of parts which correspond as regards general features of origin, position, and nature; but with no reference either, on the one hand, to conformity to any ideal plan, or, on the other, to any community by descent; in fact, we shall preserve the original pre-Darwinian sense of these words, which was purely descriptive, and avoid any attempt to read into them any accessory meaning.

A special interest attends those cases of transfer of inherited developmental capability where a part appears with its normal characters, but in a position which is not usual, such as the transfer of the sori of *Aspidium anomalum;* comparable with these transfers on the one hand are those apogamous growths where roots, leaves, ramenta, sporangia may arise independently out of the usual succession. These may be compared, on the other hand, with those interpolations of extra parts, such as the accessory stipules in the stellate Rubiaceæ, the extra stamens in Rosaceæ, &c. We are unable as yet to say what it is which determines the position and mode of origin of parts; I do not myself think that Sach's hypothesis of "Stoff und Form," involving ideas of material differences which have not been demonstrated, will advance the question so much as a careful following of the details in the origin of the parts, say in some of these apogamous growths. Here we see the plant body in a sense analysed before us ; any one part may be produced separately from any other. An elucidation of how any one of these is imitated and determined should lead to a knowledge of the influences which act also in the normal sequence, and determine the origin of parts in the plant body at large.

I have attempted to touch upon some of those questions in the Morphology of Plants which specially interest us at present, and I dare say in doing so have revealed to you some of the special weaknesses of this branch of the science. The want of finality in this unravelling of history without documents, the ample latitude for difference of opinion, according to the relative weight attached by one or another to the same facts ; these are difficulties inherent in the very nature of our study, while to many minds they increase rather than diminish its attractions. Nevertheless the progress of morphology in late decades has plainly been towards a truer appreciation of how divers forms have originated, and so towards a better recognition of affinities. Seeing that this is clearly the main trend, we may take heart as to the advancement of morphological knowledge. We shall not allow ourselves to be deterred by reason of the want of finality or the deficiency of evidence, however strongly we may feel the weight of these difficulties. We shall rather try to make the best of such evidence as we possess, with the full confidence that, however insoluble the problem of descent may really be, inquiry along scientific lines will at least lead us nearer to the goal.

CANNAS.

During the last few years cannas have come wonderfully to the front, and are now indispensable in most establishments for the beautifying of beds or borders. They are strikingly pretty even as single specimens, but it is when they are grouped in fairly large masses that they produce the most telling effect. The groups, too, are most effective when confined to one variety, or varieties very much alike in colour of flowers and foliage. Perhaps the most suitable places for cannas are the margins of shrubberies, fairly large beds, and mixed borders. In such positions the clumps can be well separated. In filling very large beds clumps of ten or twelve dotted over it, and the intervening spaces filled with Bartonia aurea, or something of this kind, are very effective. For smaller beds cannas might occupy the centre, and be surrounded with Coreopsis Drummondi, edged with some dwarfer plants. These isolated beds look well both at a distance and near at hand, but cannas are most conspicuous when employed to give a little colour to the margins of shrubberies. Here the varieties with pale green leaves and bright flowers give a pleasing tint to the whole, and liven up the rather sombre hues of rhododendrons, yews, &c. Cannas are well worth growing for their foliage alone during the summer months, as a variety of tints, from pale green to dark purple, can be obtained.

For indoor decoration the cannas are also exceptionally valuable, either as pot plants or cut flowers. As pot plants nothing can be better for grouping round the base of palms or forming banks of foliage and flowers for filling recesses or corners. Although the taste for cannas has led to a great increase in the number of varieties in recent years, yet in gardens rather remote from large establishments the old and inferior kinds are still to be found. In order to bring themselves abreast of the times gardeners should once a year, at least, visit some place or places where the cream of recent introductions can be seen. The lesson thus learned will well repay the time and money spent. For choice, perhaps, some large up-to-date nursery establishment would be best, as greater variety is more likely to be grown to meet varied tastes than at any private one, be it ever so large. In the larger private gardens the best kinds of certain decided colours only are likely to be met with, as the special tastes of the owners have to be gratified. In verification of this I might remark that recently in the gardens of his Grace the Duke of Westminster at Eaton Hall I saw Königin Charlotte extensively grown. It is a very strong-growing variety, with broad green leaves, and rich velvety blood-red and yellow flowers, which are produced freely. The individual blooms are unusually large and of good substance, and the plants are apparently of a hardy constitution, for they were growing luxuriantly at Eaton. Besides this variety there were several others admirably grown under glass at Eaton by Mr. Barnes, his Grace's head gardener.

At Dickson's huge nursery establishment at Chester two large pieces of ground were filled with cannas of all colours during this season, and here the most fastidious could be satisfied. For general purposes I noted a few of the most distinct, those with dark-coloured flowers and foliage and those having exceptionally huge flowers and green leaves. Among the dark foliaged and flowered section Colonel Dodds stood out conspicuously ; it is also a tall-growing, robust form. J. Bichon has orange and red flowers of unusual size, even amongst the large-flowered section. Doyen J. Sisley is a salmon-scarlet, just a little paler in colour than J. Bichon ; Madame Crozy, a brilliant scarlet, edged yellow ; and Progression, golden yellow, spotted chestnut-red. These six varieties are the best I have seen ; in fact, I might say the cream. Of course, opinions might differ, but so far as a strong constitution, free flowering proclivities, and decided colour are concerned they would be hard to beat.

J. Riddell.

Some New Potatos.—Challenge, one of Mr. Finlay's productions, bids fair to become a popular round, for it is a great cropper, excellent in quality, and is very handsome. Devonian, an old-fashioned shaped kidney, sent me for trial by Mr. O. Thomas, is a capital cropper also and of superb quality. I regard this variety as a great acquisition to our best eating potatos. Iva is very much like the preceding in appearance, and as it came originally from the Canaries I rather think it may be the same as is the variety we can purchase in the shops from Teneriffe in the spring. It, too, is of first-class quality. Pride of Tonbridge has also been remarkably good with me, giving a capital crop of handsome white kidneys. My own trial this season has been a fair one, but drought terribly baked the soil.—A. D.

SOUV. DE LA MALMAISON CARNATIONS.

During the past few years large flowering carnations have attained to an exceptional degree of popularity, and are now grown with more or less success in most gardens. Some measure of this increasing popularity is doubtless due to the excellent new varieties which have been raised by Mr. Martin Smith at The Warren House, Hayes. This gentleman has, by careful cross fertilization, produced a large number of distinct improvements in carnations of several types, and especially amongst the large flowered or Malmaison section success has attended his efforts. Besides the delightful fragrance and the charming colours introduced by these new ones, the very essential quality of a sound and vigorous constitution is characteristic of them all. Their cultivation is thereby much more easily managed, and under reasonable conditions the plants yield most satisfactory results.

Many people have found by experience that the cultivation of the old lovely pink and blush varieties is by no means an unmixed pleasure, chiefly owing to their susceptibility to disease, and, unless under the best of management, their weakly and uncertain constitution. Neither of these two old sorts, however, are altogether superseded, and they should not be given up. The fascination of their lovely flowers, and probably, too, the gratification obtained in mastering any intricacies of culture, is continually increasing the number of those who determine to have a house wholly or in part devoted to carnations.

The accompanying illustration will give some idea of the beauty of a number of plants in full bloom, though it cannot convey the pleasing associations of colour or the delicate perfume which combine with the capital lasting properties of the blossoms to ensure their appreciation by all lovers of flowers. The plants in the foreground of the picture are from layers rooted the previous autumn, and are carrying but one flower each. Those in the centre and at the back are one year older, and give from a dozen to fifty blooms, according to the number of growths and the amount of disbudding practised. The group is mainly composed of the two original Souvenir de la Malmaison forms, but includes the ten new ones sent out previous to 1898. This autumn twelve more are being distributed, making a total of twenty-two directly emanating from Hayes. They have an excellent reputation, and from the appearance of the young plants are all good growers, a fact which will commend them to beginners.

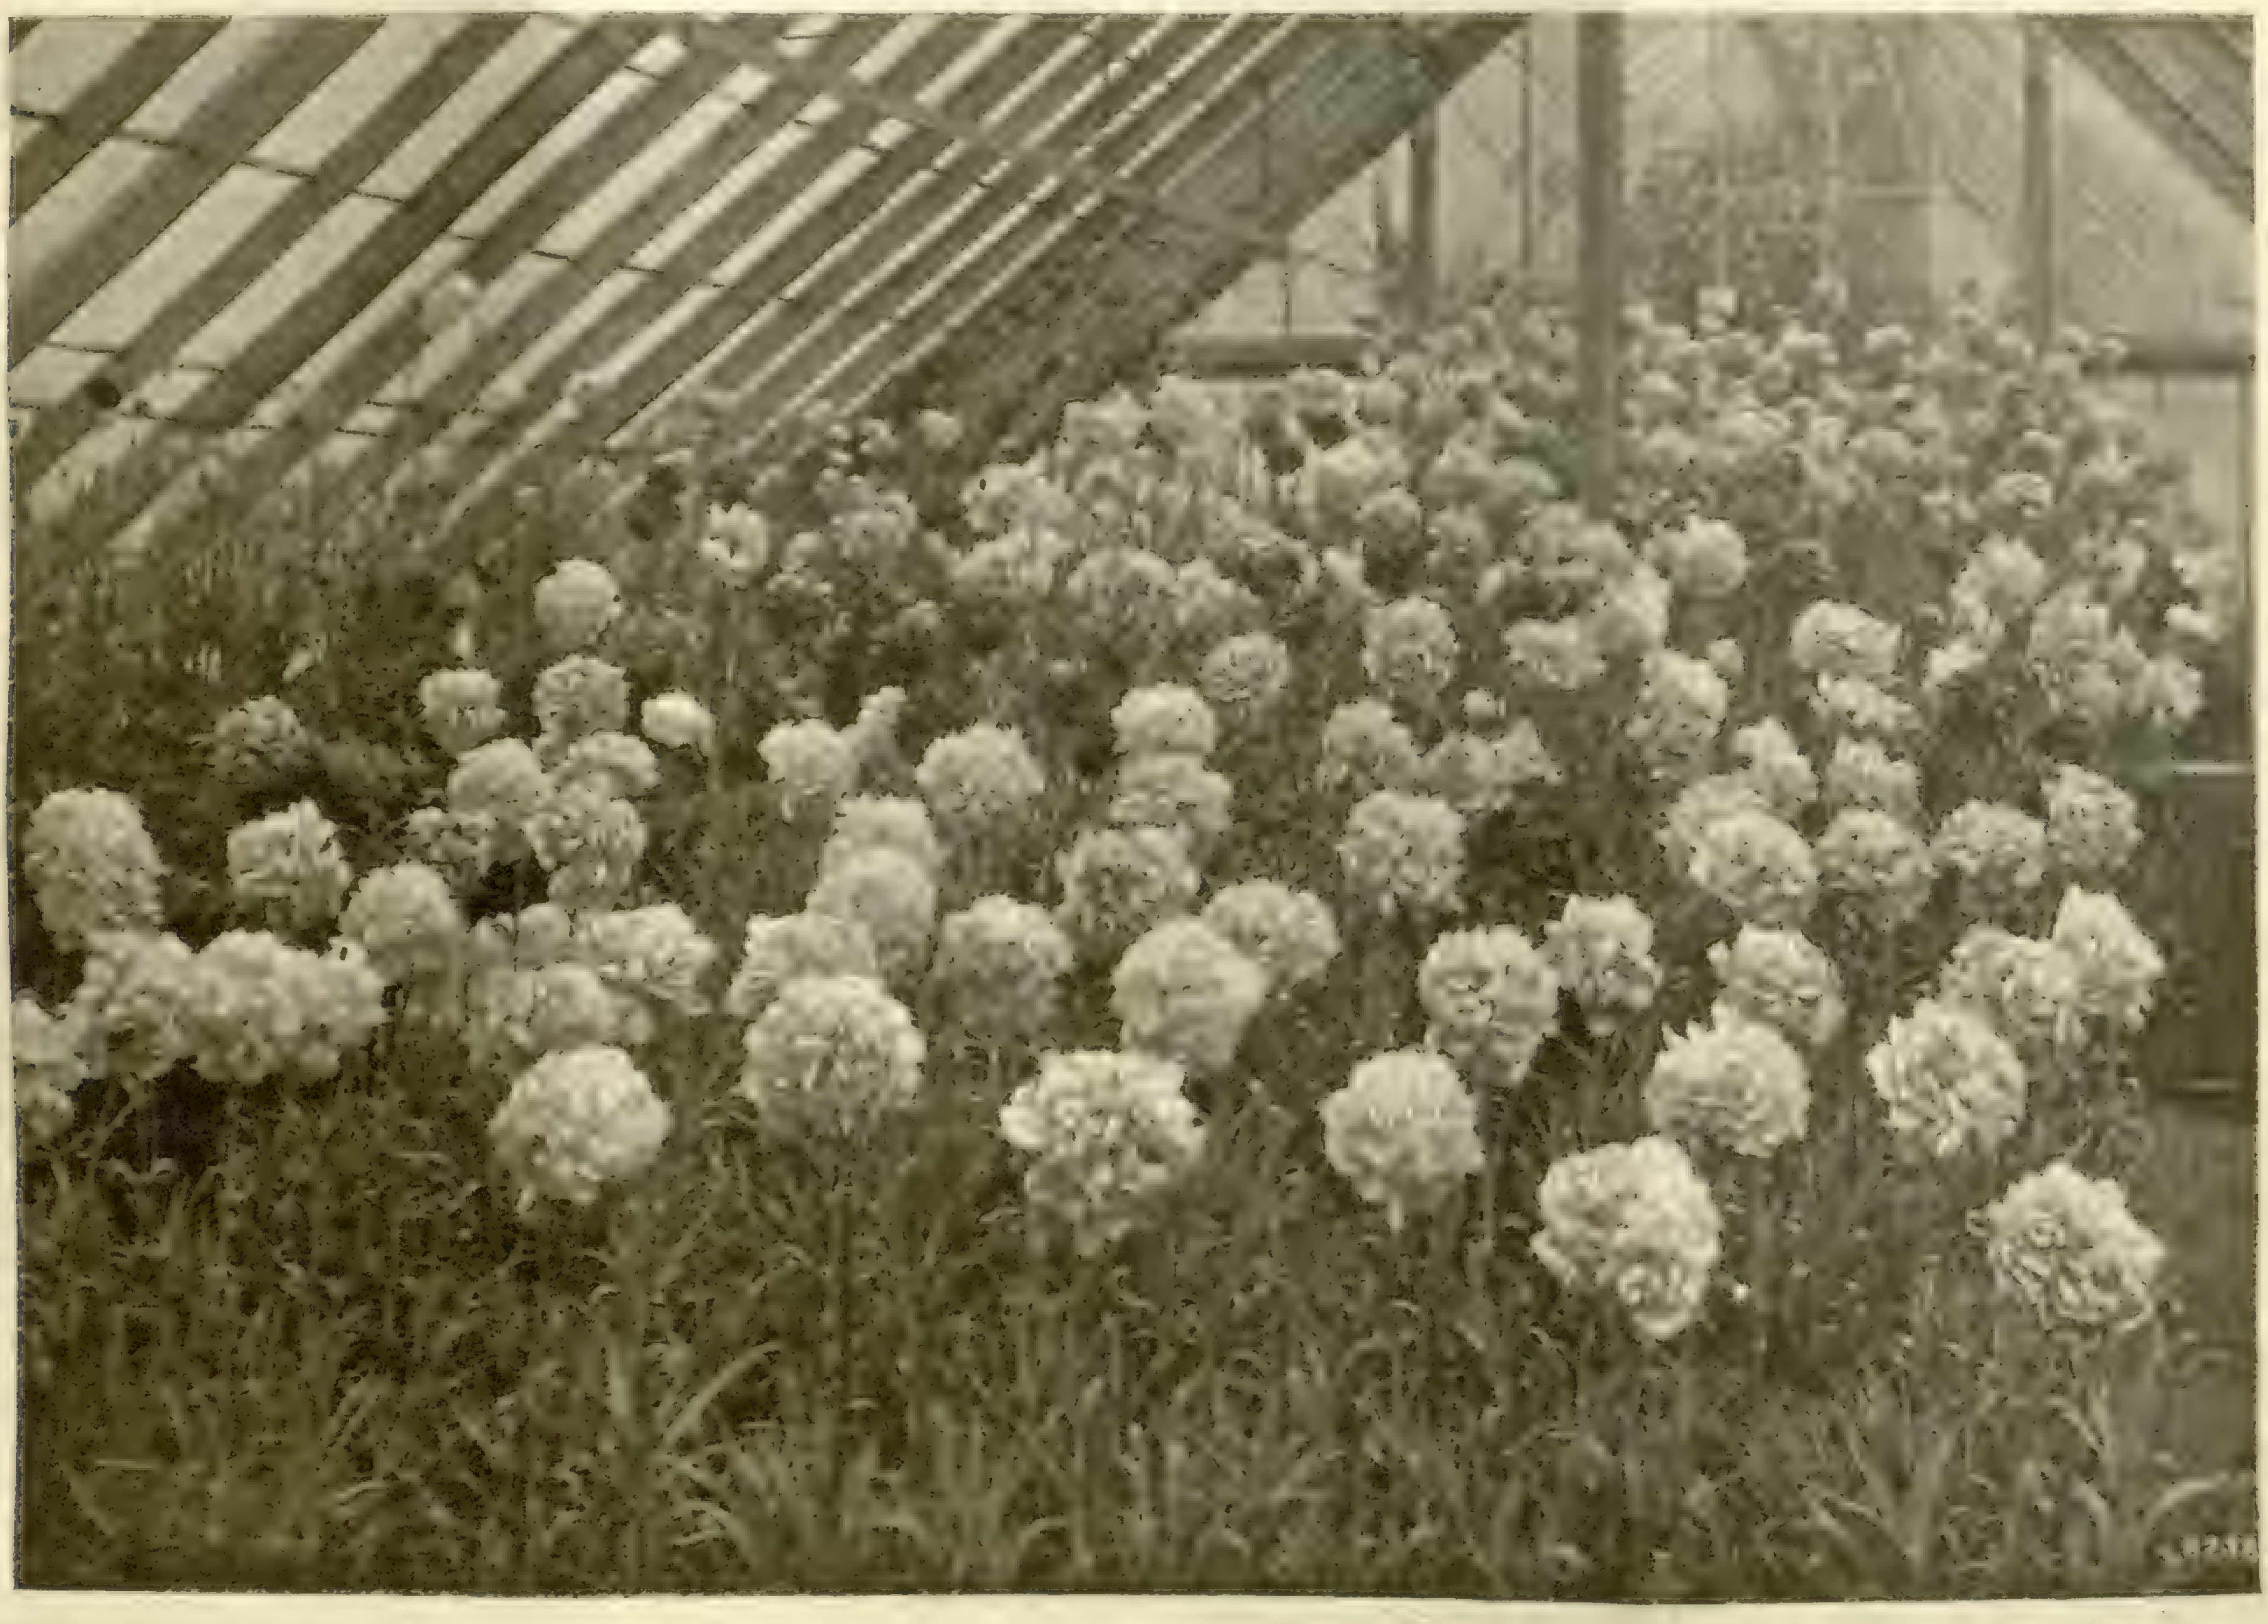
As the details of cultivation may be helpful to some who have not hitherto been so successful as they could wish, I have been asked to give an outline of our own treatment, and a brief description of the several new varieties which have already flowered here may also be acceptable. The largest flowered form is Sir Charles Freemantle ; its blooms are enormous, and though it does, like most of the others, burst its calyx, there are such a number of petals that the flower does not become loose or unshapely. The colour is good, a deep rosy pink. Lady Grimston is very sweet; the colour is a flaked mixture of white and rose, whilst the habit of the plant is exceptionally good. Princess May is the earliest to bloom; the flowers are of medium size, bright rose in colour, and produced on good long stalks. Nell Gwynne is white, and though yet only flowered on small plants, it promises to be first rate. Lord Rosebery is excellent ; it is described in the lists as dark rose, but nearly approaches crimson in colour. The Churchwarden is a fine crimson ; its habit is dwarf, and it produces many growths. Prime Minister, bright scarlet, is a splendid plant ; the flowers are large and nicely scented. Trumpeter is rather tall in growth, and comparatively short in the leaf ; the flowers are very good, sweet scented, and dark crimson in colour. Sir Evelyn Wood and Mrs. Everard Hambro are perhaps the least desirable of the set, though they may be included in a collection. Their flowers are borne on rather short stalks, though the growth of both is vigorous. The former is a striped flower, pink on a white ground, and the last-named is crimson, but with us soon loses its brightness. Perhaps none of those named have quite the rich and powerful fragrance of the two well-known old varieties, hence these should be largely included in all gardens.

The chief points to bear in mind in cultivating the plants are that they must always have abundant ventilation, a cool, comparatively dry, buoyant atmosphere being most essential at all times, but especially must this be provided during winter. The soil should be a free, open mixture, mainly composed of the best turfy loam obtainable. In potting, provide ample drainage, and press the soil quite firm and even throughout. Then the watering—a frequent cause of failure, even where it might be least expected. No plants are more sensitive of too much moisture, and during the dull months of the year it is surprising how little they require. It should not be given unless the ball of soil is parting from the sides of the pot, and a sharp ring is discernible when the pot is rapped. The right condition is not difficult to ascertain after a little experience ; but, of course, it is possible that the plants may suffer for lack of water, though in a cool house in winter time this is not likely to occur. Whilst the plants are in full growth, and during the flowering season, they naturally take much water, and the risk of giving too much is not so great. The frequency of supply then will be governed by the condition of the roots, whether the soil in which they grow is fully occupied or not, and outside influences of weather.

The season for propagation is during July and August, and increase is made by layering. Usually the two-year-old plants complete the cycle, as it were, and after flowering in June are immediately used for propagation. This is best done by plunging the old plants in a bed of soil under an ordinary garden frame, because here the layers may be shaded from bright sun, and also sheltered from heavy rains. As soon as they are well rooted, and have been severed from the parent plant about ten days, they are potted into sandy soil in three and a-half inch pots. They are still kept under the frame, ventilated slightly for the first few days until established, and shaded. After this the lights are only used as a protection from rain, and through the heat of the day are well raised above the frame to carry shading, but otherwise are removed entirely. Light syringings are given during very hot weather until September. A capital place to winter these young plants is on a shelf near the roof, in a peach-house, or any similar place, where they may have abundant light and ventilation. Early in the new year they need potting into five or six inch pots, still giving them a similar light and airy position. The soil used depends entirely on the nature of the staple loam. The silky, fibrous loam from the Epsom district of Surrey is a good sample, and to two-thirds of this may be added the remaining portion, equally composed of leaf-mould, well-decayed horse manure, and good fibrous peat. Mix with the whole a little finely-broken old mortar rubble and plenty of some coarse sand, with just a dusting of the best quality bone meal. Ordinary details of potting will naturally receive careful attention.

From this stage the plants will go on steadily till the flower spikes develop. Then comes the question of disbudding. Whether all or part of the side buds are removed is entirely a matter for the grower to decide. The choice lies between one finely formed, large flower, or several medium to small-sized ones. Shade from strong sunshine should always be given, and especially while the flowers are opening. As soon as flowering is past a repotting will be necessary into eight or nine inch pots, using similar soil to that already advised. A first-rate position for the remainder of the summer is provided by removing the plants to the open, and plunging them two-thirds of the depth of the pots in ashes or leaves, with just a board round to keep these together. Then a rough framework, some two feet above the plants, should be arranged to carry lights, in the event of heavy rains, or shading when required. Ultimately, as the pots become filled with roots, liquid manure may be given in moderate quantities, and at alternate waterings, until the plants have passed out of bloom again, when they are generally used for propagation instead of for larger specimens. Insects which may be troublesome are aphides and thrips; both are readily destroyed by fumigation indoors, or, if only a few of the former are present, a dusting with tobacco powder will remove them.

Trent Park Gardens. W. H. Lees.



HOUSE OF SOUV. DE LA MALMAISON CARNATIONS AT TRENT PARK.

Amaryllis Belladonna.—The Belladonna lily has flowered unusually well this autumn, and its culture is very simple, and entails but little trouble. Although it is not desirable to lift the bulbs frequently, yet where some time established and become crowded it is prudent to lift them and select the largest to replant, utilising the surplus for another site. Directly after flowering is over will be found the best time for this operation. In planting anew, a warm position should be selected, a narrow border against the front wall of stoves, vineries, or greenhouses with a south or west aspect has been found a very suitable situation to ensure a free-flowering and good growth, the bulbs to be planted almost close to the front wall. A fairly good and rich soil is needed, and the bulbs should be planted at least three inches under the surface. Where not lifted, a little of the old top soil should now be removed, and a rich top-dressing be given to induce a vigorous growth.—C. Herrin, *Dropmore Gardens.*

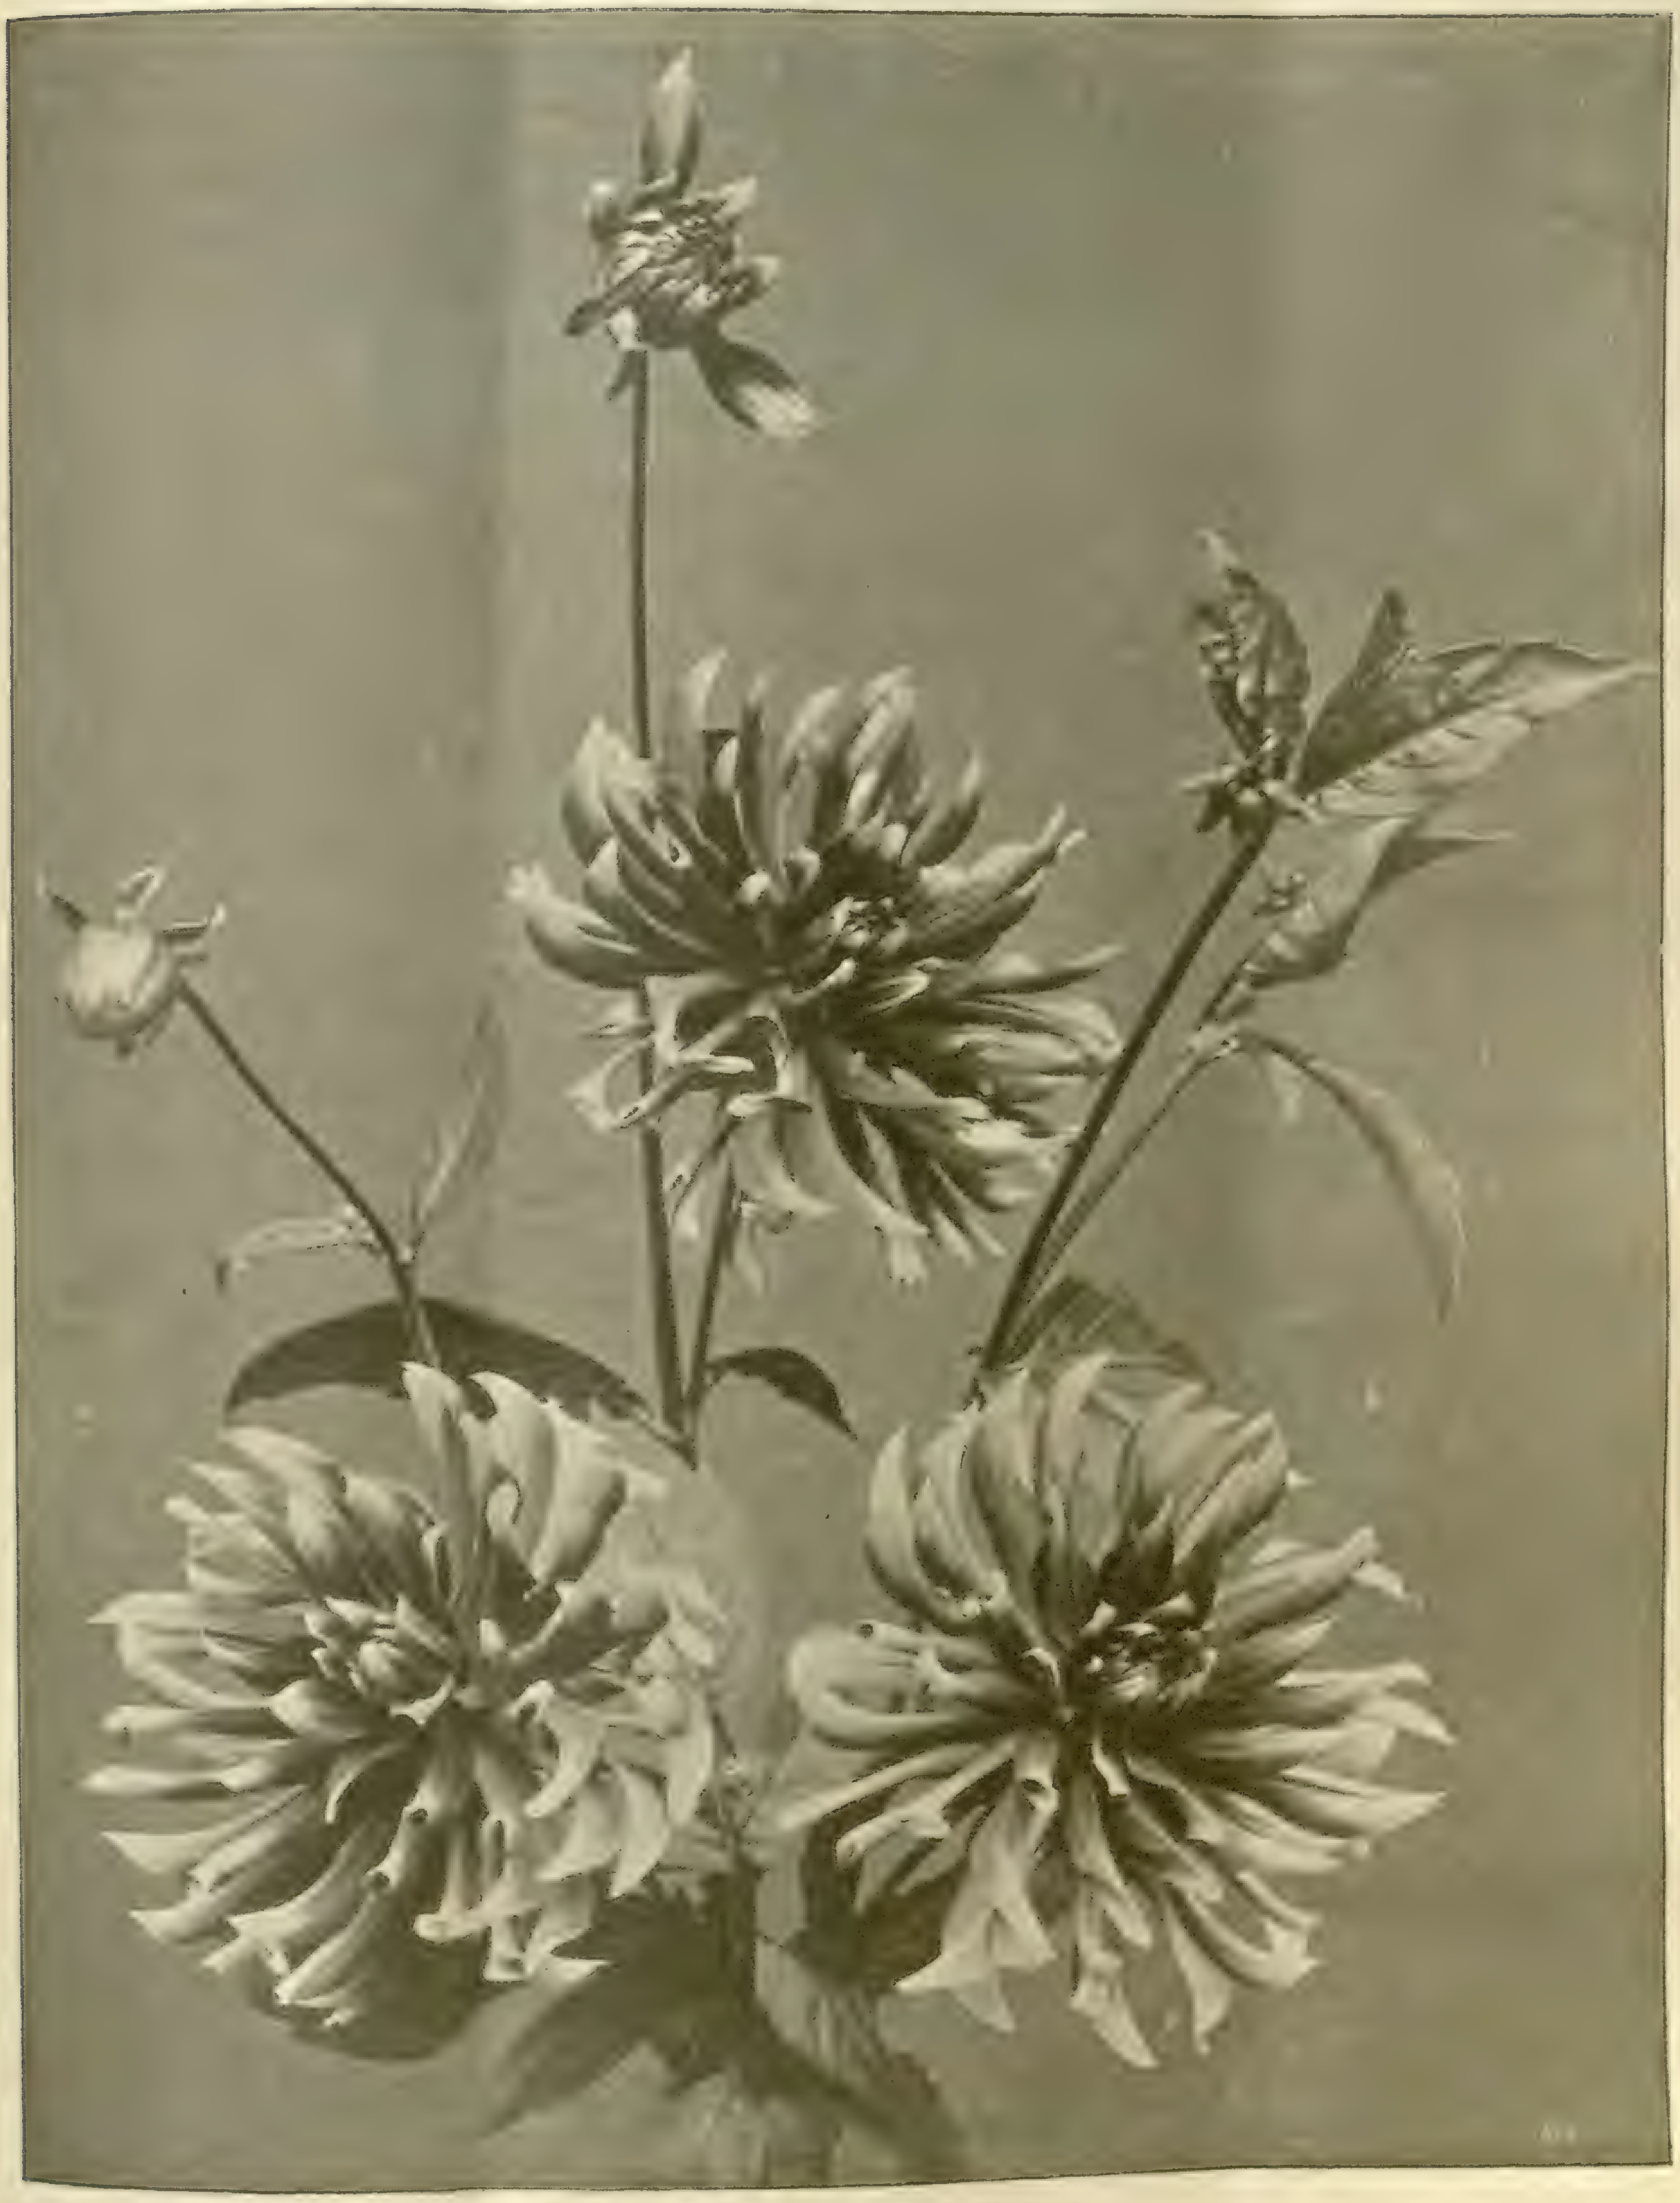
CACTUS DAHLIA THE CLOWN.

Quite a distinct type of cactus dahlia, both as regards form and colouring, was introduced by Messrs. Keynes, Williams, and Co., of Salisbury, when they produced the pretty variety named Arachne, and, considering the popularity this had and has, it was only natural to anticipate further developments in a similar direction. The variety named The Clown has followed Arachne, and while it is not more beautiful than the latter it has a bolder flower and is a better grower. Our present illustration, reproduced from a photograph, admirably represents the new form, and shows the curious disposition of the white and scarlet colouring; but whereas Arachne—which gained two first class certificates and an award of merit in 1897—has the flowers very much narrowed and pointed by the reflexion of the lateral edges, The Clown has broader segments, with just a sufficient turn to the margins to produce a quaint and distinct effect. Then also the colours are disposed in curious but effective mottlings on The Clown, and doubtless this peculiarity suggested the name given it by Mr. Wyatt, the genial head of the firm of Messrs. Keynes, Williams, and Co. The variety is of fair but not excessive size, and the flowers are carried clear of the foliage on stiff, wiry stems. When exhibited before the Royal Horticultural Society on September 20 last The Clown was considered worthy of an award of merit.

FOREIGN CHRYSANTHEMUM SHOWS.

These are probably more numerous this year than ever, and some of them are events of considerable importance. At Lille there will be a conference and show of international interest, another is also promised at Troyes, under the auspices of the French N.C.S. The Paris show also promises to be one of the best and largest in extent.

American shows are advertised to be held at Boston, Brockton (Mass.), Buffalo, Chicago, Elmira, N.Y., Germantown, Hartford, Indianapolis, Morristown, N.J., New Bedford, Newport, R.I., New York, Philadelphia, Poughkeepsie, Providence, St. Louis, Syracuse, Toronto, Walo (Texas), and Worcester, while nearer home Continental and adjoining countries announce the following:—Alexandria (Egypt), November 5; Algiers, October 28 to 30; Amiens, November 19 to 21; Arras, November 13 to 15; Antwerp, November 12 to 14; Bourges, November 3 to 7; Bordeaux, October 29 to November 3; Cette, October 29 to November 3; Chambéry, date not fixed, but during the first fortnight of November; Cognac, October 28 to 30; Clermont Ferrand, November 10 to 13; Cairo, November 4 to 6; Grenoble, October 28; Geneva, date not fixed, but early in November; Hanover, November 6 to 13; Lyons, November 4 to 13; Lille, November 10 to 15; Langres, November 12 to 14; Le Vésinet, date not fixed; Moulins, November 3 to 6; Milan, November 10 to 14; Nimes, October 28 to 31; Paris, November 9 to 14; Pau, November 10 to 12; Turin, October 22 to 29; Villafranca, November 12 to 14. C. H. P.



NEW CACTUS DAHLIA, THE CLOWN.

APHIDES.

THE season of 1898 has witnessed an unusually widespread attack of aphides, or "green flies," as they are commonly called, upon trees, plants, and flowers of many kinds. (Aphides are termed "green flies" indiscriminately, as if they were of the same species, though each kind of tree, plant, and flower has its peculiar species, with as well-defined distinctions as the host upon which it is found.) It is believed that the mildness of the winter and the absence of sharp frosts preserved the hibernating aphides of species that are generally affected by normal winter weather; while the abnormally small rainfall also favoured, without doubt, the preservation of these species.

The *Board of Trade Journal* states that among the trees most seriously attacked by aphides were limes and beeches. The foliage of the former trees, in some cases, shone with the honeydew falling from the numbers of aphides on the under surfaces of the leaves; their fragrant blossoms were materially lessened by the injurious action of the insects; and many of the leaves withered and fell prematurely. Varieties of ornamental limes in gardens and shrubberies, such as *Tilia argentea*, *T. europea*, and *T. euchlora*, suffered particularly from the continuous action of aphides in the past season. The aphis infesting limes is known as *Pterocallis tiliæ*, of the family *Lachninæ*, whose wingless viviparous female is yellowish-green with a black head, and a long and narrow body with black stripes upon the abdomen. The winged female is yellow with dark legs, and ample iridescent wings with forked cubital veins. Boussingault states that in Switzerland these aphides often kill lime trees by their persistent attacks.

The beech aphis (*Phyllaphis fagi*) belongs to another genus of the *Lachninæ*. It seriously injures the common beech (*Fagus sylvestris*), as well as the "Copper" or Purple beech. There were many complaints of harm caused by aphides to Purple beech trees in gardens and shrubberies. The insects swarmed on the under sides of the leaves and changed their rich glossy colour to dull sombre tints. This aphis covers itself with a waxy exudation resembling white cotton or silk, which with the "honeydew" forms a nasty, sticky mass on the lower parts of the leaves. The wingless viviparous female is green when deprived of its cottony coat, with a rather narrow body, large red eyes, and a short beak or rostrum.

With regard to remedial measures against these aphides infesting trees, it is impossible to adopt any in the case of fully-developed and large trees. Young trees and fair-sized trees in gardens, public parks, and in shrubberies may be syringed with soft soap and quassia by means of specially constructed garden engines, having strong pumps. In several instances purple beeches were syringed in this way with very great advantage. The mixture used was 7 lbs. of quassia chips and 7 lbs. of soft soap to 100 gallons of water.

Peach and Nectarine Aphis.

Peach and nectarine trees were infested with the aphis named *Aphis amygdali*. As the fungus *Exoascus deformans*, causing what is termed the "curl," was abundantly present in many gardens, this aphis was not always held to be the author of much harm, though, in fact, it did incredible mischief to the trees as well as to the crop of the present year. Spraying and syringing with soft soap and quassia, in the proportions of 6 lbs. of soft soap and 6 lbs. of quassia chips to 100 gallons of water, was successfully adopted in the case of this insect. Spraying, too, with a weak solution of sulphate of copper and lime, at the rate of 5 lbs. of sulphate of copper and 2½ lbs. of lime to 100 gallons of water, was useful against the "curl" fungus.

Plum and Hop Aphis.

The "blight," as the attack of aphides is termed in Kent, sorely beset the hop plants. There has seldom been such a persistent visitation. As fast as the hop growers washed off the insects fresh swarms appeared, and, where spraying or "washing," as it is called in the hop districts, was neglected, the leaves turned black, and the cones were black and full of filth. The hop aphis (*Phorodon humuli*) is distinguishable by the lowest joint of the antennæ being toothed, and each of the frontal tubercles is also furnished with a tooth. A remarkable feature in the life history of this aphis is that it migrates from trees of the *Prunus* tribe to the hop plants in the spring, returning to the former to lay eggs upon them, in which state the winter is passed. Clouds of winged aphides may be seen in September leaving the hop grounds on their way to the plum, damson, and sloe trees in the neighbourhood, and, in the spring, flights of winged females are again seen coming from the plum and damson trees. It was long ago believed that there was a migration of these aphides from plum and damson trees to the hop plants, and Professor Riley determined this by close observation made near Maidstone in 1887. There is little doubt that besides the hibernation of this insect in egg form upon trees of the *Prunus* tribe there are some wingless viviparous females, which hibernate in the ground close to the hop hills, if the weather is not abnormally severe, and produce young upon the first approach of spring. In many hop districts, notably in Kent, where there are numbers of damson trees, and where the plantation of these trees is gradually extending, aphis blight regularly recurs, and with increased intensity, entailing enormous expense in washing the plants, which operation frequently has to be done five and even eight times.

But this hop aphis—which comes from plum and damson trees in the spring and returns to them in the winter, when eggs, to be seen easily with a pocket lens, are laid on the twigs and branches—must not be confounded with the plum aphis (*Aphis pruni*). This insect remains upon plum and damson trees throughout the year, and is quite a distinct species from the hop aphis. It makes its appearance in the form of wingless females, popularly known as green lice, the products of eggs laid in the autumn. These bring forth living young, which again give birth to lice and multiply in a remarkable manner, there being, according to Westwood, nine generations. In seasons of bad attacks, notably in the last (1898), by the time the damsons are formed they are beset by aphides which suck up the juices from the stems and the leaves near them, and cause them to drop off, or to be stunted and misshapen. Plum trees are also often seriously injured in the same manner, but not so much as the damson trees. As a rule, prudent fruit growers spray or "wash" damson and plum trees, before the fruit is formed, with solutions of soft soap and quassia, made of the extract of 6 or 7 lbs. of quassia chips and 6 lbs. of soft soap to 100 gallons of water. This solution, thoroughly applied, was very efficacious in the past season in cleaning off the aphides and their filth. It is found that Paris green, mixed with the quassia and soft soap solutions, makes them far more effective. Only a very small quantity of Paris green is used for this purpose, four ounces to 100 gallons of this solution being found sufficient to affect insects without injuring the blossoms and leafage.

Apple Aphis.

The apple aphis (*Aphis mali*) makes its appearance as soon as the leaves show signs of coming forth, and it follows up the blossoms from their earliest development. It is very destructive to the blossom of certain kinds of apple trees whose leaves are hardly out when the blossom is formed—as a rule, the blossom of apple trees appears before the leaves are perfectly developed. The aphis attacks the blossoms, which are sweet, and either prevents fructification or so attacks the tiny fruitlets that, weakened by the extraction of their juices, they do not "set" properly. Those that manage to set rarely attain to full size and perfection. As the leaves of the trees come out they are covered with aphides and curl up, become black, and finally fall.

The winged viviparous female has a light green body with black markings, and wings with peculiar neurations. The egg-laying females are somewhat round in shape, they deposit little black eggs between the folds of the rind near the buds at the end of the summer. These are hatched in the early spring and produce wingless viviparous dark green females, called by German entomologists *Stammütter*, and "adult queen aphides" by Mr. Buckton, from which are produced many generations of lighter green larvæ, the main cause of the active injury to the leaves and blossoms. These larvæ have long rostra, or suckers, and are covered with fine white powder. It is considered that in some cases, and when the winter season is mild, wingless viviparous larvæ hibernate as in the case of the hop aphis. Washing or spraying apple trees is of great benefit if it is done early and well. It not only clears away aphides, but at the same time materially checks the winter moth and other allied caterpillars, as well as the apple sucker (*Psylla mali*) and the apple weevil (*Anthonomus pomorum*). The materials used for spraying apple trees are the extract of 6 lbs. or 7 lbs. of quassia chips and 6 lbs. or 7 lbs. of soft soap to 100 gallons of water. Paris green added to this in the proportion of 4 oz. to 100 gallons of the mixture is of great advantage, as it poisons the food of the insects and does not hurt the foliage or blossoms.

The multiplication of pests like the apple aphis and of other insects is much influenced by the neglected and unpruned condition of the apple trees. Where the bark is thick and full of deep fissures, and the branches are thickly twisted together, and when lichens and mosses are allowed to cluster densely upon the boughs and twigs, insects are generally far more numerous and destructive than upon trees that have been pruned properly, well scraped, and cleared from foreign growths. The lamentably neglected condition of many of the apple orchards of this country serves to intensify and to perpetuate the visitations and injuries of the apple aphis, the woolly aphis, the whole tribe of winter moths, the ermine moth, the apple blossom weevil, the *Psylla*, the codlin moth, and other pests, to say nothing about equally dangerous fungi. Other insects also depend upon these neglected apple trees for their subsistence, or make them their shelter and refuge, from which they emerge to blight or destroy other crops.

Currant Aphis.

Among aphides which were particularly abundant and troublesome to black and red currants during the past season was the *Rhopalosiphum ribis*, the currant aphis, which makes galls, or swellings, upon the surfaces of the leaves of black or red currant bushes. The galls are usually of a red colour, and upon examination of the under surfaces it will be seen that there are companies of larvæ engaged in sucking up with their club-shaped syphons the juices from the leaves, causing them to blister, curl up, and eventually fall. The currants in these circumstances often "shank" and "run off," like grapes in vineries where the conditions are unhealthy. The winged viviparous female has large, long translucent wings, and is prettily marked, having a yellow body with black and green bars and spots, a black thorax, and yellow legs with black feet. At the end of the season wingless egg-laying females are evolved which lay long large eggs, and fasten them to the stems and twigs of the currant bushes. In this aphis, which is green in colour, the wingless viviparous female, or adult wingless female, has large cauda projecting beyond the cornicles.

Cherry Aphis.

Myzus cerasi is another aphis infesting currant bushes as well as cherry trees, but there are several and important differences between this and *Rhopalosiphum ribis*. The wingless female is much broader and has a somewhat squat form, being dark in colour with yellow legs, and the winged female's body is also much broader with different venation of the wings.

This insect does not make galls upon the leaves, but the swarms of larvæ congregate under the leaves and suck out their juices. They also emit quantities of the curious secretion known as honeydew, which falls upon the leaves below them, also upon the bunches of fruit, covering them with sticky filth. The other currant aphis, *Rhopalosiphum ribis*, does not emit honeydew.

The action of *Myzus cerasi* upon cherry trees is the same as upon currant bushes. The leaves are pierced by countless beaks, or rostra, and the fruit is covered with honeydew.

It is almost impossible to use remedial measures for the attacks of these insects upon currant bushes. The leafage is so thick that spraying is a most difficult operation, and could hardly be performed so as to reach the aphides upon the leaves within the bush, especially in the case of red currant bushes. It might be attempted early in the season, when the aphides are first discovered and the leaves not so dense. After infestation black currant and red currant bushes should be pruned more closely than usual. The cuttings should be taken away and burned. Spraying with kerosene emulsion might be tried, before the leaves appear, upon bushes infested in the previous season, as it might make the surroundings of the aphides unpleasant for them when they come on the scene.

Cherry trees fastened to walls may be easily sprayed, and small standards also, either with garden engines or knapsack machines. Large trees would require special machines with powerful pumps. The quassia and soft soap mixture, as prescribed above, would be the best to use. Spraying should be done early—as soon as aphides are seen.

Aphides on Vegetable Crops.

Carrots and parsnips were much infested by an aphis, the former being injured somewhat seriously in various market garden districts and in allotment and private gardens. The leaves of many of the plants became quite shrivelled, and the roots were consequently stunted and deformed. The mischief was generally not quite so great in the case of parsnips, though in a few instances the roots were very poor and "spindly" from the exhaustion of the leaves by the aphides. Celery plants were also infested by the same aphis and somewhat injured. The species of aphis found upon the carrots and parsnips was that defined as *Siphonocoryne pastinaceæ*. The winged viviparous female is yellowish green with a dark green head and yellow legs. The wingless female is green, with long vasiform cornicles. The legs and the antennæ are short; the rostrum is also short, club-shaped towards the end, and finally terminates in a sharp, black point. When very young the larvæ are often of a light brownish hue, but they soon turn to green.

It is obviously difficult to spray carrots and parsnips, as they are so full of foliage, and the leaves of carrots are often close to the ground. It is not so difficult to spray celery plants if a knapsack machine is used, and if this is done early, with quassia and soft soap, in which a little paraffin is mixed, churned up well together, it would also keep off the celery fly, a far greater pest than the celery aphis. Swedes and turnips were infested by the *Aphis* (*Rhopalosiphum*) *rapæ* in some parts of England and Scotland.

Field and garden beans were much infested by *Aphis rumicis*, the "Black Dolphin," and their crops in some places were seriously lessened. This aphis is black in all its forms, except in the very early stage, when it is brown. Little or nothing can be done to check this attack in fields; in gardens it is possible to spray infested beans.

Rose and Lily Aphis.

Aphides were abundant upon rose trees, and upon several species of garden lilies. In the former case they were easily cleared off by spraying with quassia and soap solutions, but this was nearly ineffective with the lilies, as the aphides were covered by the folds of the buds.

SPRING FLOWERS.

AT a recent meeting of the Devon and Exeter Gardeners' Association Mr. Andrew Hope read an interesting paper upon the above subject. Proceeding to describe the various flowers as they appear in spring, the essayist appropriately referred firstly to the aconite, which gives a warmth of colour at a cold time of the year, say early in January. Sweetest of spring's children was the snowdrop. As a rule—

> "The snowdrop in purest white arraie
> First rears her hedde on Candlemas Daie,"

as an early Church calendar has it. Of the snowdrop, many of the best varieties are grown in, and exported from, Palestine. The flower has been dedicated to the Virgin Mary, from the fact of its being so often found in the gardens of old nunneries. In many parts of Devonshire a single blossom when taken into a house is considered to be a death-token from its pure white shroud-like colour and form. Whilst the snowdrop speaks to us of gentle repose and shyness, the crocus breathes an air of exuberant gladness. The ancients dedicated the crocus to St. Valentine, and in an old Church calendar of flowers it is referred to in the lines:—

> "The crocus hastens to the shrine
> Of primrose love on St. Valentine."

Milton employed this gaily amorous flower to stud the retiring bower of Adam and Eve before the Fall. One of the most dainty of spring flowers, and one that is too little known, is the Glory of the Snow (Chionodoxa Luciliæ), which is absolutely hardy and has been seen blooming in the hard frosty ground of February. It likes sandy soil, and some of the finest specimens have been grown between Budleigh Salterton and Sidmouth. Scillas or squills used to be more popular than they are now, which is a pity, because their blue flowers are none too plentiful. Daffodils are perhaps the loveliest of spring flowers. The grandest of all the varieties of the daffodil is the Narcissus maximus, which has been truly described as "like a vase of beaten gold." One of the most satisfactory of all the Narcissus family is the Sir Watkin, of which, near Falmouth last spring, some were cut with stalks about four feet long and flowers of enormous size. The daffodil is indeed, as Keats describes it, "A thing of beauty and a joy for ever."

The hyacinth he described as the queen of spring flowers, and the title is not inapt. Its bulbs are only grown for sale in one country—Holland—and in only a small part of that not very large country, for it might be comprised in the area between Heavitree and Exmouth and the estuary of the Exe on one side, with a distance as far as Sidmouth for its breadth. This is a perfectly level plain, and the soil is a kind of sticky black sand, the nearest approach to which is the land near the village of Newton Poppleford. The process of reproduction is by scooping out the base of the bulb, and making incisions across the exposed part at right angles, and replanting with the cut part downwards. Then there comes out a very large number of bulblets which nestle and grow like chicken under a brood hen. These bulblets are properly dealt with until in the fourth or fifth year they are ready for sale as flowering bulbs. Tulips make a grand show in the spring, and at a small cost. Those who had seen the public parks in our great cities knew what an effective display is made, and he hoped to see the public gardens of Exeter similarly treated before long. Ten pounds spent on Northernhay would be a good investment, and would be a certain attraction for citizens and visitors. During the last few years the anemone has become popular, especially the large brightly-coloured sorts. Anemones are most useful as cut flowers, for they last a long time in water, and to the end retain a gay and not ungraceful appearance. There was a time when the ranunculus was much grown, but lately they have been neglected for the less formal, much larger, and more brilliantly coloured French ranunculus.

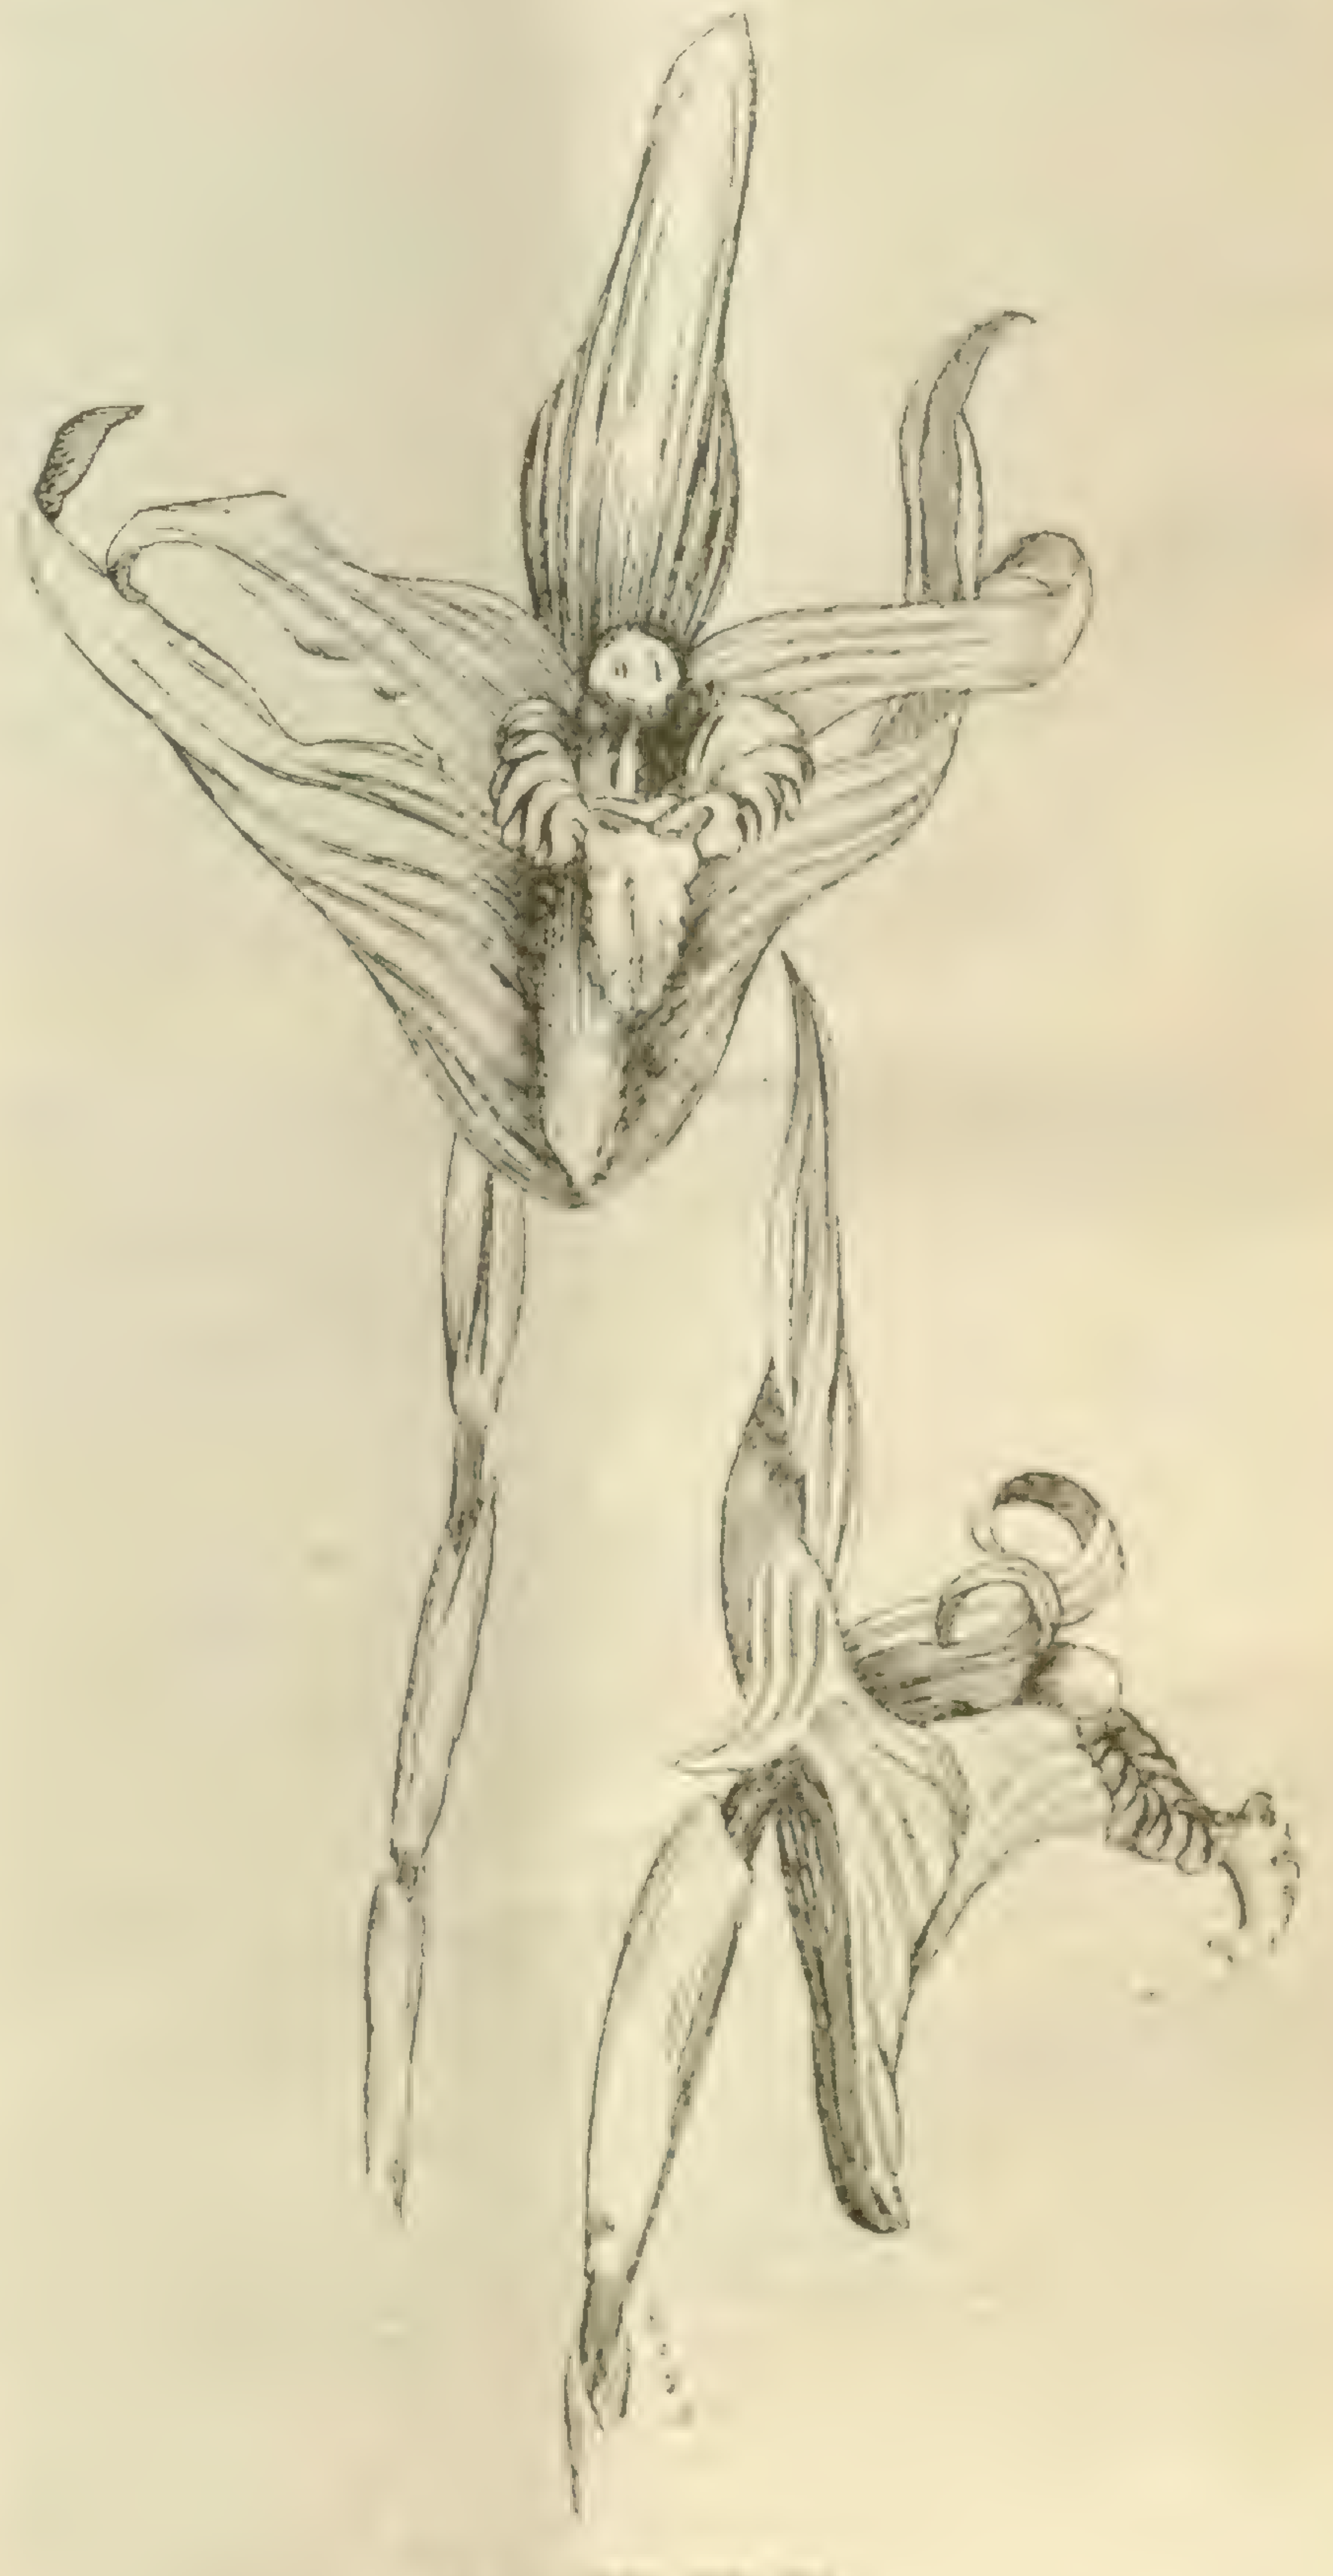
Though his remarks had been confined to bulbous-rooted flowers, Mr. Hope did not forget their spring companions so beautifully referred to by Nature's poet, Thomson, in "The Seasons." There were some spring flowers which were too rarely seen. For instance, there was the Crown Imperial, one of the noblest and handsomest, with its flowers, bell-shaped, hanging down in a circle like a bejewelled crown. The fritillary is another old-fashioned and very beautiful flower. It was given as a wild flower occurring in the east and south of England, and it is said to have been found in our county "about East Down" many years ago by the Rev. J. H. Townsend. The irises are a large and scattered family, but all are beautiful and interesting, and few flowers that bloom in the spring can compare with them for general usefulness and interest. The taller varieties have a majestic appearance, and from that cause possibly the iris was adopted as a symbol of power. We have it on the sceptre and as a national emblem on our coinage—the fleur-de-lys or luce.

Besides out-of-door flowers there were many very beautiful subjects which brighten the conservatory and greenhouse of the early months of the year, and of this the Gardeners' Association had afforded ample evidence in the excellent spring shows held under its auspices for two or three years. Among the most popular and useful for Christmas decorations are the Roman hyacinths, which are grown in the South of France. Of the lily of the valley, by far the finest is the Berlin variety. Another very useful conservatory flower is the Polyanthus narcissus, of which there are now many charming kinds. Freesias are highly serviceable plants, for their perfume is delicious, they occupying small space and are easily grown. He had not treated upon other spring favourites, such as cyclamen, spiræas, genistas, dielytras, primulas, auriculas, &c., and he hoped others would supply the deficiency on some future occasion. They might not be able to turn the "winter of their discontent" into "glorious summer," but they could by judicious arrangement and forethought secure a wide choice and have an array and a succession of lovely spring flowers in the winter months until "the rain is over and gone, and the time of singing of birds is come, and the voice of the turtle is heard in the land."

NOTES ON ORCHIDS.

MAXILLARIA STRIATA.

THIS pretty Peruvian orchid is still somewhat scarce in collections, although introduced by the Messrs. Linden and Co., L'Horticulture Internationale, Brussels, about 1892, and flowered for the first time, in cultivation, at their establishment in August of that year. So far as shape is concerned the species is intermediate between M. venusta and M. grandiflora, having a labellum very much like that of the former. The sepals and petals are rather attenuated, and in some forms the tips recurve somewhat; they are yellowish-green with regular striations of reddish-purple, the lines fading, however, towards the apex of each segment, leaving a bright greenish-yellow tip. The lip has a white ground colour, and the curved, central lobe is almost pure white; the side lobes recurve prettily, and so show off to full advantage the handsome veinings of bright purple. The extreme diameter of a good form of Maxillaria striata may be as much as five and a half inches, but in the majority of instances coming under our notice the flowers measure a little over four inches across. The blooms are borne singly at the apex of stout, six to eight inches long, scapes, and when several are expanding at once a most effective and elegant plant is the result. M. striata is not so gorgeous as Cattleya Mossiæ, but then we should get tired of nothing but cattleyas in our collections of orchids.



MAXILLARIA STRIATA.

EULOPHIELLA PEETERSIANA.

This splendid orchid from Madagascar was described and figured in these columns when it flowered for the first time in England at Burford Lodge, Dorking. We refer to it now in connection with the two coloured illustrations that appear in the *Bot. Mag.*, t. 7,612, 7,613, as the text states the discoverer of the species was Johannes Braun, who died at Antananarivo, but who sent specimens of leaves to Dr. Kranzlin, these measuring two feet in length. At a later date Mr. Mocoris sent living plants to M. Peeters, the well-known orchidist of St. Gilles, Brussels, where one flowered and provided Dr. Kranzlin with the necessary material for completing his description. It is to be sincerely hoped that plants of this grand eulophiella will be forthcoming in quantity now that Madagascar is less turbulent than formerly, for such an orchid should be in every collection.

WORK FOR THE WEEK.

COOL ORCHIDS.

THE time is now at hand when the application of water to cool orchids will require the most careful attention. To give a hard and fast rule as to the amount of water each species requires is impossible; what one requires is discretion and keen observation regarding the state of the weather, the size and health of the plant. A plant in a large pot with a huge mass of material about the roots will not need water nearly so often as one in a smaller pot. It is generally understood that orchids should be kept in a rather dry state whilst inactive, but even this must not be overdone, for I have seen plants so shrivelled by drought as to be beyond recovery. Ada aurantiaca is a species that requires little water during the winter months, but the soil should never be allowed to become thoroughly dry; this species thrives admirably in company with the odontoglossums during the summer months, but should now be placed in a slightly warmer house for the winter, for if kept cool the leaves become spotted on the under surface and a check is given. Lælia harpophylla will only need sufficient water during the dull months to keep the pseudo-bulbs from shrivelling, and it is also much better if removed into a warmer house. Epidendrum vitellinum having now made up its new pseudo-bulbs should have a much smaller supply of water at the roots until the flower spikes commence to push forth next spring; this species, like Odontoglossum Rossi, will stand the cold better than most cool orchids, but if subjected to too much moisture during winter the leaves spot badly.

Odontoglossum madrense is a very distinct and handsome cool house orchid, the deliciously fragrant flowers lasting several weeks in perfection, and plants of it have formed a special feature in our houses for many weeks past; usually, by the time the flowers fade, the pseudo-bulbs are fully made up, but if the spikes are removed as soon as the flowers are fully open the bulbs are then about half-grown, therefore the plants should be generously treated until growth is complete, after which only sufficient water must be afforded to keep the roots from perishing and pseudo-bulbs from shrivelling. The Brazilian oncidiums, as O. varicosum, and its fine variety, Rogersi, O. crispum, O. tigrinum, and O. Forbesi, are now throwing up their flower spikes, and it should be remembered that it is an easy matter for these plants to exhaust themselves by abundant flowering; indeed, this is often the cause of plants gradually dwindling away. The best practice, even with strong plants, is to cut the spikes off as soon as the flowers are open, placing them in water, where they will keep fresh for a good length of time. With regard to small, weakly plants the spikes should be pinched out as soon as they make their appearance. Oncidium concolor will not require much water now, the compost being kept just moist until the flower spikes appear. Cattleya citrina is now growing freely, and should be kept moderately moist at the root; it should be given the warmest position in the house, or better still, if convenient, be removed to a warmer house.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

THE season has arrived when the plantsman must be ready for sudden changes of temperature, and once more it has become necessary to have the heating apparatus in proper working order, so that the necessary amount of warmth may be given at nightfall not only as a preventive against frost, but also against a low, sluggish atmosphere. All available space under glass in many gardens will be crowded with a variety of plants which require such protection directly frost threatens, but unless a buoyant atmosphere is maintained many of the occupants soon show the evil results of overcrowding and the want of pure fresh air, causing many to damp off. It is far safer to maintain a gentle warmth in the pipes with a certain amount of ventilation at the highest point of the house or pit for the escape of condensed moisture, thereby keeping the ventilation closed, with a view to saving fuel. Damp during the prevalence of November fogs proves most destructive to plant life and the lasting properties of bloom. The condition of the atmosphere in the conservatory may be kept slightly warmer than that in the greenhouse to suit the requirements of palms and other things; moreover, for some weeks to come banks of chrysanthemums, bouvardias, primulas, and such like will be giving a gorgeous display, and to retain the flowers in a fresh condition as long as possible the greatest care should be exercised in watering the plants. The roots should never lack moisture, but in applying it see that as little as possible is spilled about the stage and floor. As regards syringing, this should be curtailed as much as possible, and the palms and other foliage plants need only be slightly dewed overhead on bright mornings, allowing time for the dampness to pass off before sunset.

Some little anxiety is caused the last thing at night to determine whether it is necessary to turn on a little heat in case of frost. We have always found it better at this season—especially with houses where the occupants are kept as cool as possible to retard their flowering—to turn on sufficient heat to nicely warm the pipes, and then shut it off the last thing. This, as a rule, is sufficient to ward off 10 degrees of frost, and there is not the danger of the temperature rising too much, making it higher at night than perhaps it was during the day; or, what is worse, to find that the "chink" turned on over night was not sufficient to cause circulation, and so have the mortification of finding Jack Frost had made an entry. Unheated pits may still be used for cinerarias and other things which it is necessary to retard for succession, providing double mats are available for covering the glass when their use becomes necessary. These and many other tender foliage plants soon fall a prey to green fly, when the ventilation has to be reduced. It is a great mistake, and proves anything but a saving in the cost of fumigating, to defer doing so until the pest has gained a foothold. A slight fumigating once a week or ten days will keep the foliage clean at a trifling cost. As the days are now getting very short, with only a few hours' sunshine at the best, any shading which was used on the glass during the summer should be washed off at once, so that all the light possible can reach the plants below. Creepers, too, that have been trained to the roof might be thinned somewhat with advantage, as these not only obstruct light, but the long trails of foliage are apt to hold the condensed moisture from the roof glass, and perhaps cause a drip to fall on other things situated beneath them. It is almost impossible to keep plants healthy, or to preserve bloom, unless the roof is drip-proof.—RICHARD PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

WHERE early forced vegetables are in request leaves should now be collected for making hot beds. Good oak, beech, or chestnut leaves are the best, as these, if collected when dry, will retain the heat for a considerable period. As the growth of asparagus has now ripened, this may be cut down and the roots taken up for forcing. Asparagus does not require a great amount of heat to cause it to start into growth, therefore it will not be necessary to make very substantial hot beds to generate sufficient warmth to promote a healthy and vigorous start of the crowns. If leaves and stable litter are mixed together in equal portions and turned over a few times to allow the rank steam to pass off, the bed may then be made up and the soil placed on. As the roots are lifted they should be taken and placed thickly together on the bed and covered with about four inches of light rich soil. Care must be taken not to allow the fermenting material to become over-heated or the roots will be burned, at the same time a genial temperature must be maintained or growth will be stunted. After the first sharp frost the foliage of seakale will begin to fall, the roots may then be lifted and the crowns prepared for forcing. To grow tender and crisp seakale too much heat should not be employed, and if forcing can be done without the aid of fire heat so much the better. A temperature of from 55 to 60 degrees suits the growth of this admirably, but perfect darkness must be secured if a crisp sweet growth is to be produced.

Mushrooms will now be in great demand, and as the outside temperature is reduced their growth will be less rapid, therefore artificial means must be resorted to if a supply is to be maintained. Where beds were made up during the summer, in a cellar, these will now be ready for bearing, so that if a little water be given, heated to about 70 degrees, just sufficient to moisten the surface of the beds, which should afterwards be covered to prevent evaporation, the mushrooms will soon make their appearance. Collect and prepare more material in readiness as other beds become exhausted. We have at last had some rain, which has moistened the soil, therefore those who have not previously been able to put out their spring cabbage may now do so, and the sooner such work is completed the better. Pay particular attention to vegetables in frames. Do not allow them to become drawn for want of air, or frosted owing to neglect to put on the lights.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

POT vines for carrying the earliest crop of grapes are a great relief to the early vinery proper, which may be kept back for a few weeks yet, and thus escape the hard forcing during the dullest part of the year which is necessary to produce ripe grapes early in April. Such hard forcing has a bad effect on permanent vines, and the produce is never really first class. It is time now to put the earliest pot vines into position for forcing, as a slow start with moderate heat is better than delaying later and then pushing growth on rapidly. Good light pits with a sunny aspect are the best quarters that can be given, the pots being stood on piers or some other rigid foundation near, but not close up, to the front wall, and surrounded with a good body of oak or beech leaves which have already fermented slightly in a heap outside. Some growers use stable manure with the leaves, but this is often the cause of too rapid fermentation, producing too much bottom heat to begin with and over-stimulating the roots, which is one of the worst things that could happen. Leaves, on the contrary, if well prepared and sweet, give off a gentle heat which lasts for a long time. They should be packed tightly round the pots and brought up nearly to the rims. Test the bottom heat frequently, and if it should rise much above 70 degrees pull away some of the plunging material for a day or two, replacing it when danger of overheating has passed. In cases where it is impossible to use plunging material in the usual way some means must be devised for keeping the pots moist at an equable temperature, and not subjecting them to the sun's rays. Quite the best lot of pot vines I saw fruited this year had their pots placed in others a few sizes larger, at the bottom of which were placed a few inches of good, rich soil, the remaining space being filled up with green moss, which was kept damp all through the season. It is not always convenient to provide extra pots in this way; but rough-made boxes, or even a plank or two set on edge, would answer the purpose intended, and should be easily available. The vines should not be at once tied up in position, but should be bent round so that the middle part of the canes, which generally produces the weakest breaks, is most elevated, as this will help to induce regularity in breaking. No cutting of the vines must take place now, as this would induce bleeding; if any of the lateral growths have not already been removed they should be left intact for the present, and have their buds rubbed out as the vines break into growth; this is a very good way of dealing with vines that have been a little backward in ripening, for, though the short lateral growths which some vines produce more freely than others make the rods look a bit rough, they do no harm whatever, while cutting them away now, or within a few weeks of starting the vines, might cause bleeding. The proper temperatures for the pits to commence with will be 50 degrees by night and 55 degrees by day, allowing the usual 10 degrees rise above this with sun heat. These temperatures should be the maximum for the present, and no harm will accrue if a degree or two less occur in very cold weather, as this will be better than firing hard to keep to a fixed standard. Syringe the vines once or twice a day when the weather is fit, but not late enough in the day to have moisture hanging to them during the night; also keep the walls and plunging material moistened on the surface. The roots, of course, must be supplied with tepid water as they need it, but they will not require much until growth is being freely made, so that care is necessary not to give overdoses of water at the start. Ventilate slightly on all favourable occasions, but exclude draughts and close up the pits early in the afternoon before the temperature begins to fall.

Fruiting vines will need careful attention in the matter of heating arrangements. The bottom heat should not fall below 85 degrees, and should be kept at that as nearly as possible. It is at this time of the year when bottom heat from hot-water pipes is most valuable, as it is not possible to regulate the heat properly with plunging material alone. The top heat may range from 70 to 75 degrees by night, and a good rise allowed with sun. Damp down between and round about the plants freely in fine weather, but avoid overhead moisture, and leave off watering at the roots when the fruit begins to colour. Allow a fall in the night temperatures for successions to arrest growth during the winter, 60 to 65 degrees is quite hot enough at night, and the plants will require but little water.—J. C. TALLACK, *Livermere Park Garaens.*

Tree Leafage in Towns.—How well in the autumn thick-leaved trees, &c, such as the plane, fig, vine, and ivy, amongst other things, demonstrate their exceeding value as producers of town greenery. On the other hand, thin-leaved trees like the lime, elm, acacia, and others soon look very brown and miserable. It is astonishing with the experience now possessed of the unsuitableness of the lime for town planting it should be still largely employed. No doubt early in the season it wears a very pleasing appearance, but certainly in the autumn it presents then a very ragged and deplorable aspect. The plane carries superb green leafage several weeks after that of the lime has become browned, and largely fallen. Doubtless the excretions of lime leafage, commonly called honey dew, not only early exhaust the leaves, but because rendering them glutinous cause dirt rapidly to accumulate on them, and thus renders the stomata incapable of performing natural functions. In the country limes remain green much longer, but still are amongst the earliest to show the effects of root drought. The fig is one of the very best of autumn town trees. Late in showing leaves it carries them in vigorous condition very late into the autumn. So also does the vine. The rich crimson coloured variety Coignetiæ should make a capital town climber. Certainly any common vines are good ones, keeping foliage late. Ivy does remarkably well, too, where established, but it well repays an occasional washing. The tulip tree also keeps its leafage very late and green, and is an admirable town tree.—A. D.

EXHIBITIONS AND MEETINGS.

ROYAL HORTICULTURAL SOCIETY, October 25.

An altogether first-rate exhibition was held at the Drill Hall on the above date, and no one could complain of lack of variety among the exhibits. Chrysanthemums were largely displayed, orchids were good, and fruit was especially fine. In the afternoon Mr. G. Gordon, V.M.H., delivered a lecture upon Experimental Horticulture, the chair being taken by Dr. Masters, F.R.S.

Floral Committee.

Mr. W. Wells, Earlswood, Redhill, put up a large and showy group of orchids, showing a fine lot of early flowering varieties of widely different shades of colour. Among these were staged single-flowered specimens of President Nonin, General Pacque, Mrs. White Popham, a grand variety; and numerous good seedlings, including one provisionally named R. H. Pearson. Among the cut flowers were fine flowers of Le Grand Dragon, Pres. Bevan, Werther, and General Pacque. Among the early flowering varieties we noted Mychett Beauty, golden; Jules Mary, crimson; Mychett White, Madame Marie Masseé, Mons. Dupuis, Claret Bell, and Crimson Pride as especially good; Nellie Brown, rich bronzy scarlet, was also very handsome. Mr. Wells was awarded a silver Flora medal. Mr. A. Kingsmill, Harrow Weald, showed prettily fruited growths of Vitis heterophylla humulifolia carrying plenty of bluish berries. Mr. T. S. Ware, Tottenham, had a large and most attractive exhibit of dahlias and early chrysanthemums; the dahlias were especially fine for so late in the season, and in the cactus varieties we observed fine bunches of African, Fusilier, Beatrice, J. T. Barber, Blanch Keith, Mrs. W. Fell, Matchless, Sylvia, Harmony, and Starfish; silver Banksian medal. Messrs. J. Waterer and Sons (Limited), Bagshot, Surrey, sent a handsome lot of conifers, all shapely specimens, and many of them having variegated foliage; Retinospora filifera aurea variegata, Thuiopsis dolobrata variegata, Libocedrus decurrens aurea variegata, Juniperus chinensis aurea, Thuiopsis borealis aurea variegata, and Cypressus Lawsoniana lutea were a few of the brightest forms shown; silver-gilt Flora medal.

From Mr. W. J. Godfrey, Exmouth, came specimens of a golden-orange decorative chrysanthemum named Ettie Mitchell and bunches of Emily Grunnerwald, a beautiful soft golden variety suitable for decoration; several stands of cut flowers of exhibition sorts came from Exmouth, and these included Halcyon, a large Japanese anemone; Gold Standard, Japanese; Madame W. T. Budde, pink; Le Grand Dragon; Autumn Glory, flesh pink; Reginald Godfrey, crimson and gold, very handsome; and Werther, deep red; all Japanese varieties remarkable for good form and colour. Messrs. W. Cutbush and Sons, Highgate, contributed a group of ericas, Skimmia oblata and S. japonica, Begonia Gloire de Lorraine, Pernettyas in variety, and Nerine Fothergilli major. Mr. H. B. May again made a pretty display, staging Begonia Gloire de Lorraine in first-rate style, and associated in small groups with bouvardias, chrysanthemum Mutual Friend, and carnation Mrs. Leopold de Rothschild; surrounding these numerous small groups were ferns in great variety, charming crotons, palms, acalyphas, phryniums, &c., the whole display occupying the length of one table down the hall and producing a fine effect; silver Flora medal. Mr. Robert Owen, Maidenhead, sent several stands of fine chrysanthemums, the varieties including Suzie, soft yellow; W. Towers, yellow; Lord Boston, blush; President Nonin, yellow; Soleil d'Octobre and Madame Louise; Mrs. W. Smith, golden; Brossillon, white, all good Japanese forms; Baronne de Veillard, a bronzy incurved in the way of Egyptian, was also well shown by Mr. Owen. M. Leschalles, Windlesham, showed Miss Mary Leschalles, a white sport from Reine d'Angleterre.

Dahlias were splendidly shown by Mr. S. Mortimer, Farnham, who put up ten dozens of clean and bright show dahlias, as well as first-rate bunches of the leading cactus forms, such as Arachne, E. J. Deal, Harry Stredwick, Starfish, Mrs. J. Goddard, and Miss A. Jones; silver Flora medal. Mr. J. R. Box, Croydon, sent blooms of tuberous begonias from the open ground; these were of high quality, but laid flat on moss were not attractive. Messrs. J. Cheal and Son, Crawley, sent a few bunches of handsome autumn-tinted foliage; Quercus coccinea, Rhus typhina, Rhus glabra laciniata, Cratægus crus Galli, Pyrus arbutifolius, Liquidamber styracifolia, and Berberis Thunbergi. Messrs. J. Hill and Son, Edmonton, showed ferns in variety, mostly large plants of great beauty, such as Cheilanthes elegans, Darallin Mariesi, Adiantum trapeziforme, Microlepia hirta crustata, Gymnogramma calomelamos, &c.; silver-gilt Banksian medal.

The largest display in the hall was a fine group of foliage plants staged by Mr. W. Howe, gardener to Sir Henry Tate, Park Hill, Streatham; there were huge Kentias, bamboos, big and bright crotons, Platycerium alcicorne finely grown, ferns, alocasias, graceful dracænas, and other useful stove plants, all tastefully associated, although somewhat crowded; it was an imposing display, and merited a silver-gilt Banksian medal. Messrs. H. Cannell and Sons, Swanley, showed cut chrysanthemums in variety; Mons. Bahuant, Globe d'Or, and D. B. Crane being the best incurved, and Thos. Wilkins, Reine d'Angleterre, G. C. Schwabe, Pres. Borel, G. W. Childs, Phœbus, and R. Powell among the best Japanese forms.

Mr. W. Bull, Chelsea, showed Limosa argentea, Ceropegia Woodi, Dracæna Victoria, a beautiful variety in the way of Lindeni, Maranta picta, and Ficus radicans variegata, all new and interesting plants. Messrs. F. Sander and Co. showed Ptychosperma Sanderiana and Kentia Kirsteniana, the latter more like a Caryota than a Kentia. Mr. R. Galzow, Bexley Heath, showed a grand specimen of the variegated Anthurium crystallinum, named Illustré; it was shown in a Wardian case, and was generally admired. Mr. G. W. Piper, Uckfield, showed a pretty coppery-buff tea-scented rose, named Sunrise, a new form of great beauty. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, sent chrysanthemums in variety, the most attractive forms being General Pacque, Lionel Humphreys, Soleil d'Octobre, Rayonnante, Queen of the Earlies, Werther, and Madame Robert de Massey. Mr. Boyce, Marsh Farm, Dartford, sent specimens of a second crop of horse chestnut flowers. Messrs. H. Cannell and Sons sent Polygonum molle, a graceful white-flowered species; they also showed the new decorative chrysanthemum, Nellie Brown. Mr. J. Prewett, gardener to C. A. Pearson, Esq., Farnham, staged fine blooms of Mons. Bahuant, Globe d'Or, and D. B. Crane incurved chrysanthemums, and also fine blooms of such Japanese forms as Thos. Wilkins, Mons. Pankoucke, G. C. Schwabe, Pres. Borel, G. W. Childs, Emily Silsbury, M. Chenon de Leche, &c.; silver Banksian medal.

Orchid Committee.

A pretty display of orchids was arranged by Messrs. J. Veitch and Sons, Chelsea, who were awarded a silver Flora medal. Graceful examples of Oncidium varicosum, O. crispum, O. pulvinatum, and Odontoglossum Percatorei made a charming background for a comprehensive lot of orchids; Lælio-cattleya callistoglossa ignescens, L.-c. Nysa, Cattleya Mantini, C. Wendlandi, Miltonia spectabilis Moreliana, Miltonia vexillaria Leopoldi, Cœlogyne Veitchi with long spikes of white flowers, Cypripedium insigne Sanderæ, Odontoglossum grande, finely flowered, Gomeya recurva, and Catasetum fimbriatum were all finely represented, together with many cypripediums of value. From Messrs. Stanley Mobbs and Ashton, Southgate, came a splendid lot of well-flowered plants of Lælia pumila, these representing a great variety of shades of colour, but all large flowers; Cattleya gigas, C. labiata Lewisi; this group merited a silver Banksian medal. In the exhibit made by Messrs. F. Sander and Co., St. Albans, there was a grand specimen of Cattleya Harrisoniæ with nine large spikes of beautiful flowers; several forms of C. labiata made a good show, while a two-spiked example of Cymbidium grandiflorum occupied the central position; smaller orchids of note were Habenaria militaris, Masdevallia melanoxantha, and Habenaria carnea.

A pretty little lot of orchids was shown by Mr. W. H. Young, grower to Sir F. Wigan, Bart., Clarelawn, East Sheen; a finely grown plant of Cyperorchis (cymbidium) elegans was conspicuous with its light drooping spikes of yellowish flowers; Cymbidium Winnianum was represented by one spike; Cattleya labiata alba, very fine; C. Dowiana aurea, Lælio-cattleya Hon. Mrs. Astor, Lælia pumila, with flowers over five and a-half inches across, and Cypripedium Godefroyæ leuchochilum were among the most interesting of the other orchids staged; silver Banksian medal. Mr. C. A. Roberts, Rose Hill House, Ipswich, sent some orchids growing in Clozone pots. Mr. W. King, gardener to J. Colman, Esq., Reigate, showed a beautiful form of Lælia pumila with blush tinted sepals and petals. Mr. W. H. Young submitted Lælia Perrini leucophæus, a beautiful pale-tinted and large-flowered form. Lælia Briseis was again shown by Mr. J. Douglas, Bookham, who also sent Cypripedium macropterum, a cross between C. superbiens and C. Lowi. Lælio cattleya Henry Greenwood was again shown, this time by Mr. W. Gill, gardener to H. Greenwood, Esq., Highfield, Haslingden. Mr. J. Davis, gardener to J. Gurney Fowler, Esq., South Woodford, showed a pale form of Cypripedium insigne. Mr. W. Goodliffe, Worthing, sent Cypripedium grande and C. Boxalli. Cypripedium insigne Cobbiana and C. i. Sanderæ were shown by Mr. W. Cobb, Tunbridge Wells. Cypripedium Evenor was sent by Messrs. H. Low and Co., Clapton.

Fruit Committee.

Mr. G. Woodward, gardener to Roger Leigh, Esq., Barham Court, Maidstone, put a magnificent lot of apples and pears. Mr. Woodward is so well known as a successful exhibitor that our readers can well imagine the big fruits with their fine clear skins and rosy or scarlet cheeks; Mère de Ménage, Bismarck, Washington, Gascoyne's Scarlet, and Emperor Alexander were gloriously coloured, as indeed were many other varieties. The pears were equally fine, Beurre Superfin, Doyenne de Merode, Brockworth Park, Fondante de Thirriott, Pitmaston Duchess, Princess, and Margaret Marillat were especially good. A Hogg medal was awarded and thoroughly merited. An attractive collection of well-grown fruit was staged by Messrs. J. Laing and Sons, Forest Hill. The collection was a comprehensive one, and among the many varieties we noted Adam's Pearmain, American Mother, Court Pendu Plat, King of the Pippins, Lord Lennox, Baumann's Red Winter Reinette, Worcester Pearmain, Bismarck, Winter Queening, and Hoary Morning apples as very clean and bright; silver Knightian medal.

Mr. E. Beckett, gardener to Lord Aldenham, Elstree, showed a grand lot of celery, staging three heads each of Pink Perfection, Crystal White, Aylesbury Prize Red, Major Clarke's Red, Superb White, Early Rose, Standard Bearer, Solid White, Claymonth Prize, Dwarf Solid Red, White Gem, Leicester Red, and Sutton's A1. A silver Banksian medal was awarded. Mr. J. Prewett, gardener to C. A. Pearson, Esq., Farnham, staged a good collection of apples and pears, not large, but clean and bright specimens of all the leading sorts; silver Banksian medal. Messrs. J. Cheal and Son, Crawley, were awarded a silver Knightian medal for an extensive display of apples and pears. Among the latter were fine dishes of Duchess d'Angoulême, Alexander Lucas, Marie Benoist, Souv de Congrès, Epine Dumas, Pitmaston Duchess, Abbé Fetel, and Catillac. Mr. W. Howe, gardener to Sir H. Tate, Streatham, sent three bunches of Black Alicante grapes, finely coloured and of large size, cut from a vine carrying eighty bunches; the three clusters weighed fifteen pounds. Messrs. J. Veitch and Sons showed fruiting plants of the St. Joseph strawberry. Mr. G. Wythes, Syon House Gardens, sent a bunch of bananas, a form of Musa Cavendishi; Mr. Wythes also sent a good new seedling tomato. Mr. Miller, gardener to Lord Foley, Esher, sent four fine specimens of William Tillery melons, and gained a cultural commendation. Some good beetroot came from the Chiswick gardens, the pick of the varieties on trial, but no awards were made. Mr. W. Miller, Coombe Abbey, Coventry, sent a box of fruits of Passiflora edulis. Mr. Herrin, Dropmore Gardens, Maidenhead, sent good specimens of Coe's Golden Drop and Brahy's Late Gage plums.

NATIONAL CHRYSANTHEMUM SOCIETY.

The Floral Committee held a meeting at the Royal Aquarium, Westminster, Mr. Harman Payne occupying the chair. Specially noteworthy were the following: Miss Mary Leschelles, a pure white sport of great merit, from Reine d'Angleterre; Miss Godsmah, a golden-bronze Japanese, which the committee wished to see again, as they also did Thomas Singleton. Mr. M. Russell, a fine golden chestnut-coloured incurved, was also asked to be sent up again; Madame Conval de Terrail, pale flesh-coloured Japanese, and Le Grand Dragon, a big yellow Japanese, were the objects of a similar request. Autumn Glory, a pink-coloured Japanese with a shiny reverse, was commended. Ellen Shrimpton, very bright and pretty deep rosy cerise, also a Japanese, the committee wished to see again, and Mychett Beauty, a deep golden-orange decorative variety of the Japanese type. Ten first-class certificates were awarded, and the varieties gaining awards are described under "New Plants and Flowers."

SHIRLEY GARDENERS' ASSOCIATION.

The monthly meeting of above society was held at the Parish Room, Shirley, Southampton, when Mr. B. Ladhams, F.R.H.S., presided over a fair attendance. There was a discussion on "The best Apples for the District," opened by Mr. J. Miles, the Gardens, Portswood Park. Mr. Miles gave a list of the most suitable kitchen and dessert apples for growing on the somewhat general gravelly subsoil of the surrounding district. Some good varieties canker too much to be of any service, even with careful planting. The discussion which ensued brought out the members' experiences with many sorts, and a reduced list of varieties was afterwards given to suit amateurs and cottagers desiring to plant a few sorts only. A cordial vote of thanks was accorded Mr. Miles at the close of the discussion. There was an excellent exhibition of fruit, apples, and pears, chiefly contributed by the members.

CHRYSANTHEMUMS IN THE LONDON PARKS.

Battersea Park.

Here, as at most of the public parks, the display is arranged to please the general public, and good use is made of most of the old standard sorts. The collection is housed in a large greenhouse about 100 feet long, and is very largely patronised by the local inhabitants.

The plants are arranged in a single sloping bank, and the ends and front side of the house are decorated with free-flowering plants in bush form of Margot—a great favourite here—and such pompons as Sunset, La Vogue, Sœur Melaine, Rosinante, Golden Mme. Marthe, and Précocité. A free use for the purposes of colour is made of M. William Holmes, William Seward, and John Shrimpton, whose various shades of crimson help materially to brighten the display.

Japanese varieties of Continental origin are fairly numerous. La Triomphante, an old pink seedling of De Reydellets is in good form. M. William Holmes, a deep crimson and gold October flowering variety, sent out some years ago by Delaux, is also much used for its colour. Others are M. C. Molin, Brise du Matin (Delaux), a pretty soft-coloured pink; Pres. Borel, Mme. Ed. Rey, large and good; Louise, big solid, but rather pale in colour; M. Chenon de Leché, Mlle. Thérèse Rey, Mme. Carnot, Calvat's Australian Gold, L'ami Etienne, all well-known varieties of M. Ernest Calvat's raising, are conspicuous by the excellence of their cultivation. Older sorts comprise novelties of long ago, almost forgotten by present-day exhibitors at societies' shows, but still preserved at the parks for their usefulness in groups, and of these Hamlet, a beautiful bright shade of deep rosy salmon; Comte F. Lurani, a charming rich pink on a white ground; Ed. Audiguier, deep purple maroon with a reverse of silver; Val d'Andorre, golden chestnut; Bouquet de Dames, white; Mlle. Lacroix, white; Jeanne Delaux, deep crimson and gold; and Charlotte de Montcabrier, pale pink, are the best.

Chrysanthemums of English and American origin include some very good examples of James Salter, Lady Selborne, both very old sorts; with a mingling of A. H. Fewkes, J. H. Runchman, Sunflower, Gloriosum, W. H. Lincoln, Edith Tabor, Modesto, in yellows; John Shrimpton, William Seward, Edwin Molyneux, G. W. Childs, in crimsons; and W. Tricker, pink; Florence Davis, white; Puritan, Eda Prass, Mrs. H. Weeks, very large white; Lady Byron, same colour; Good Gracious, and the new sport from Viviand Morel, called Lady Hanham.

Interspersed here and there are some freely-flowered plants of that pretty little globular pompon, colour pale pink, Mdlle. Elise Dordon, which helps to lighten the arrangement. M. R. Bahaunt, a big rosy-crimson incurved, is always striking and useful on account of its earliness; Col. W. B. Smith, golden bronze, is another; and among the large number of varieties grown, which amounts to something like 2,200 plants, the incurved family are numerous. It will suffice to mention the names of a few to show the value that may be attached to this group. Golden Empress of India, Empress of India, Mrs. W. Shipman, Baron Hirsch, Golden George Glenny, Lord Alcester, John Lambert, Queen of England, Mrs. Robinson King, John Doughty, Princess of Wales, Jeanne d'Arc, Globe d'Or, Refulgens, Mr. Bunn, Alfred Salter, C. H. Curtis, Princess of Teck, &c.

Hairy varieties receive a somewhat smaller share of recognition, the only prominent ones being Louis Bœhmer, Hairy Wonder, Beauty of Truro, Esau, Mrs. Alpheus Hardy, Spartel, and Mrs. Dr. Ward.

Finsbury Park.

This collection is housed in the same greenhouse, as usual, near the Manor Gate entrance, and is somewhat tastefully arranged by being set up within a kind of serpentine border, and sloping in undulating form towards the front. English novelties form a conspicuous feature of the collection, and comprise the Yellow Sunflower, Edith Tabor, Marjory Kinder, all good and fine; while in whites Emily Silsbury is large and freely shown. William Seward, Mrs. J. Shrimpton, the newer Mary Molyneux, Mrs. H. Weeks also help to maintain the renown of home raisers.

American novelties at the time of our visit were not to be found in any great numbers, the best, perhaps, being the deep velvety crimson Jap G. W. Childs; Mrs. E. G. Hill, valuable on account of its size and earliness; the Egyptian; Gorgeous, a noble yellow Japanese incurved, colour deep golden yellow; Eda Prass, pale creamy pink; Hairy Wonder, rich and bright; and one or two more besides.

Australie, the big Colonial raised novelty of a few seasons since, rather dull purple in colour and having a silvery reverse, is as massive as ever; while in the hairy section King of the Hirsutes, a long petalled pale yellow variety, struck us as being very well done. Alfred Chantrier, a large yellow Japanese, with tubular florets, we do not remember seeing before. Source d'Or, a medium-size rich golden bronze variety, very useful for decorative purposes; it is one of the old kinds that never seem to fall into disfavour in such displays as the one we are now noticing.

Brighter and livelier shades of colouring are to be found in some very good examples of President Borel, Préfet Robert, Edouard Audiguier, rich purple-mauve with silvery reverse; the old Triomphe du Nord, Baron Hirsch, a rich finely-incurved golden-chestnut bronze variety that always gives a good effect to a mixed group.

It is only possible to mention just briefly some of the many other sorts in this collection, and of these Calvat's Australian Gold, N.C.S. Jubilee, L'ami Etienne, M. Chenon de Leché, Phœbus, merit special attention.

We noticed that M. Freeman, a pretty dwarf incurving pink Japanese, is usefully employed as a front row plant here, as elsewhere, with good effect, and in pinks Charlotte de Montcabrier and M. Tarin always seem to find favour in the metropolitan parks, although they have long since been discarded by exhibitors at shows.

Mastic, a flat reflexing Japanese, colour pale ochre-yellow; Descartes, a brightly-coloured Japanese anemone; Mrs. C. Harman Payne, big and compact as usual; the old variety La Triomphante, and Marquis de Paris, a large white Japanese with a faint greenish centre; and Mr. C. E. Shea, the pale yellow sport from Mdlle. Lacroix, are also conspicuous by the excellence of their culture. Other varieties in fairly good form comprise such well-known sorts as Werther, M. Panckoucke, M. R. Bahaunt, big, solid, always early, and useful for its deep rich tone of colour. Bouquet de Dames, an old white Japanese, is shown in very good form, and so, too, are Souvenir de Petite Amie, and several others in the same colour. Louise, very fine in build, still maintains a foremost position as a useful dwarf front row flower for such groups as we see at the parks.

Southwark Park

The collection of chrysanthemums here is just now in good form, and will continue so for some little time to come. The arrangement is tasteful and artistic, and judiciously arranged. Among the chrysanthemum plants are various foliage plants, palms, &c., that help to embellish the display. Japanese here, as at most places, predominate, but the old type of incurved is not neglected, for some promising blooms of C. H. Curtis, M. R. Bahaunt, Mr. Bunn, D. B. Crane, Prince Alfred, Lord Wolseley, Beverley, Madame Darier, the Queens and Empresses, &c., are rapidly coming on.

There is, as was the case several years ago, an interesting collection of the hairy varieties, and of these we need only mention Enfant des deux Mondes, white; Esau, rosy pink; Dr. Ward and Mrs. W. H. Caldwell, yellow; Louis Bœhmer, Hairy Wonder, Prima Donna, Sautel 1893, and King of the Hirsutes, a large pale yellow.

English standard varieties of acknowledged merit are to be found in good crimsons like William Seward, of which there are several very finely coloured examples, Edwin Molyneux, &c. Yellows comprise Marjory Kinder, Mrs. J. Shrimpton, Charles Davis, Sunflower, J. H. Runchman, and H. Shoesmith, while whites include Lady Byron, Emily Silsbury, Mrs. C. Blick, and the old Lady Selborne. Others of home or colonial raising are the deep golden yellow Oceana, large and good; Master H. Tucker, deep crimson; Pride of Madford, purple amaranth; Miss Ethel Addison, and Australie.

Among Continentals, Gloire de Mézin, a pretty globular Japanese of golden bronze, is striking and effective; Descartes, a rich wine-coloured Japanese anemone, is also good; Commandant Blusset, purple; Préfet Robert, Madame Marius Ricoud, a pretty bright rosy pink; the famous Madame Carnot, M. Panckoucke, yellow; N.C.S. Jubilee, silvery pink; Louise, Phœbus, and a charming variety called Gambetta, which is a beautiful shade of soft, golden, salmon rose, with a golden reverse, stands out in striking contrast to its surroundings. The deep orange and bronze M. C. Molin is useful in that tint, Charlotte de Montcabrier, pale pink, old Source d'Or, and a few others from the same source are all worthy of note.

Miscellaneous novelties include G. W. Childs, a good velvety crimson; W. Tricker, a pretty and useful pink; Mutual Friend, Gloriosum, Gloire du Rocher, very fine and brilliant in its shade of golden terra-cotta, Interocean, &c.

Victoria Park.

The collection under Mr. Moorman's charge at Victoria Park is not quite so far advanced as the one at Finsbury, but it bids fair to be a very effective display in the course of a week or ten days. The plants are arranged on each side of the greenhouse with a central path, and the front of each bank is lined with a selection of pompons. Very pretty are some freely-grown plants of Ryecroft Glory, Mdlle. Elise Dordon, and Emily Silsbury; but, of course, the majority of the blooms have been grown for the purpose of obtaining good specimens, and of these the incurves are generally well represented, C. Curtis, the Rundles, Prince Alfred, the Beverleys, Globe d'Or, M. R. Bahaunt, and Baron Hirsch forming the most meritorious at the present moment. Very useful on account of its earliness is Madame Ed. Rey, a bold, large pink Japanese; Louise, big, solid, and compact, colour delicate pale pink, which are grown in fairly good number; as also are Marjory Kinder and President Borel, another useful, highly-coloured variety, and early.

Among Japanese of Continental origin Viviand Morel, La Triomphante, Mrs. C. Harman Payne, in the pinkish shades, are noteworthy, while yellows are rather better represented by such excellent sorts as Calvat's Australian Gold, Globe d'Or, Amiral Avellan, Phœbus, M. Molin, &c. Yvonne Desblanc is a very large, globular, incurving variety, pure white in colour, but as big, compact, and solid as Louise, although paler in colour, being almost, if not quite, a pure white. Descartes, a rich, deep wine-coloured Japanese anemone, with long, drooping florets, is striking and effective; and mention must also be made of the curious novelty Madame Ed. Roger, the green Japanese incurved, which in its early stages shows its peculiarity of colour in a very marked degree, and will attract much attention.

Further on we notice amongst the hairy varieties Sautel 1893, a pretty, bright-coloured specimen of that type. Perle Dauphinoise, Pres. Nonin, M. Panckoucke, and J. H. Runchman, all in varying shades of yellow, are interesting. Lady Hanham, the new sport from Viviand Morel, is coming on, and especially bright and rich are the flowers of Gloire du Rocher.

Lady Byron is a fine large white, and older known sorts in this colour are represented by Elaine, Lady Selborne, Mdlle. Lacroix, Bouquet de Dames, and several more. For richness of colour Mr. Moorman effectively blends such valuable crimsons and purples as M. William Holmes, Mr. J. Laing, G. W. Childs, Ed. Audiguier, Préfet Robert, M. Geo. Biron, and most of the well-known sorts in these shades.

The collection is a thoroughly representative one for American seedlings, such as W. Tricker, A. H. Fewkes, Col. W. B. Smith, H. L. Sunderbruck, and the pale pink Mrs. E. G. Hill are freely used. Oceana is a big yellow colonial seedling now well known, and among other popular sorts Charles Davis, its parent, Viviand Morel, Madame Gustave Henry, Silver King, Graphic, Edwin Molyneux, Pride of Madford—another colonial-raised variety of great richness of colour—are all represented by some capital examples.

Heavy Crops of Potatos.—We have had this season some first-rate crops of potatos, and, considering the dry state of the soil, this is rather to be wondered at, but I attribute the success to deep digging, good manure, and plenty of room. All the ground was turned up two spits deep last season and worked with a fork before planting, this time forking in some stable manure. We allowed three feet between the rows of short-haulmed varieties, but for Up-to-Date three feet six inches was allowed, which I consider none too much. Another advantage gained by planting early varieties a good distance apart is that you can crop between the rows without damaging either crop, the potatos coming off first. Our best crop this season has been of Carter's Snowball, which turned out at the rate of nearly thirty tons to the acre. The tubers were of extraordinary size, some of them weighing two and a-half pounds each; in fact, six turned the scale at fifteen pounds. These were the largest potatos we have ever turned out, and they were not ungainly-looking either. They cook well, and are free from disease. Next to these for crop and weight came Up-to-Date, our heaviest last season; these were of immense size, and came out at about sixteen tons to the acre. This potato is fast becoming a popular variety. Sutton's Reliance and Sutton's Ideal were both excellent, and produced a rare crop of nice, handsome potatos of fine cooking quality and perfectly free from disease. These two potatos have been much admired for their general good quality and appearance, while they yielded nearly as heavily as Up-to-Date. Sutton's Flourball has done extra well this season, and in some gardens has yielded at the rate of twenty tons per acre.—W. A. Cook, *Compton Basset, Wilts.*

SOW THE SEEDS of good health, prune and strengthen sickly and weak branches of the tree of life, with the aid of Holloway's World Renowned Pills and Ointment. The Pills improve the appetite, strengthen the digestion, and regulate the liver. Under treatment with the Ointment bad legs become sound, scorbutic skins cast off their scales, and scrofulous sores cease to annoy. When rubbed upon the abdomen, it checks all tendency to irritation in the bowels, and averts diarrhœa, and other disorders of the intestines frequently prevailing through the summer and fruit seasons. Heat bumps, blotches, pimples, inflammation of the skin, and enlarged glands can be effectively overcome by using Holloway's remedies, according to instructions given to each purchaser.—[Advt.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Tomatos.—Hortus, Aigburth: A concise little work that should suit you is "The Tomato," price 1s.

Ornamental Tubs for Shrubs, &c.—F. C., Alverstoke: We do not recommend nurserymen or traders of any kind in this column, for obvious reasons. You would doubtless obtain estimates and descriptions of such tubs as you require on application to any of the horticultural sundriesmen who advertise in our pages.

MSS. for the "G. M."—G. B., Chichester: We are obliged to you for your interest in the matter, but we cannot utilise the MS. sent us. It is more suitable for the advertisement than the editorial department. Only members of the staff write notices such as you desire, and they—as do all our regular correspondents—write on one side of the paper only, and use ink instead of pencil.

Glazing for Orchard Houses.—A. L., Leicester: A large number of glasshouses recently built have the roof glazed with long panes placed end to end, and not overlapped; this acts very well if properly done and the roof is sharply pitched. With regard to the firm in question, we are not in a position to state what methods are adopted, but if you communicate with them they will no doubt give you the necessary information.

Florist and Pomologist.—H. E. W., Paddington: The "Florist and Pomologist" is not now published; and writing from memory we believe it ceased about thirteen years ago. Sets are occasionally offered at sales of second-hand books, and the price obtained varies according to its completeness, general condition, and the horticultural interest that is taken in the sale. Some few leading second-hand booksellers sometimes offer sets in their catalogues.

Roses Under Glass.—A. L., Leicester: Of the varieties mentioned, the best for cultivation under glass are Climbing Niphetos, Maréchal Niel, Niphetos, The Bride, Catherine Mermet, Madame de Watteville, and Kaiserin Augusta Victoria. Maréchal Niel and Climbing Niphetos may not be suitable for outdoor culture in your locality, but all the others named should prove useful, provided they receive a little protection during the winter, such as a cone of ashes or dry soil placed about the base of the plant.

Judging at Flower Shows.—T. W., Stoke: Useful information relative to judging fruits, flowers, plants, and vegetables is to be found in the publication of the Royal Horticultural Society, entitled "A Code of Rules for Judging, and Suggestions to Schedule Makers, Judges, and Exhibitors." It can be obtained post free for 1s. 1d. on application to the Secretary, R.H.S., 117, Victoria Street, S.W. Another useful book is the "Horticultural Exhibitors' Handbook," W. Blackwood and Sons, price 3s. 6d., as it gives the points of merit in all the leading subjects to be found at horticultural exhibitions.

Failure of Grapes.—W. H., Middlesex: It is quite probable that overcropping was the chief cause of failure, coupled with the sulphuring and late syringing. Then the removal of so much surface soil would injure or destroy all the free-feeding surface roots, and at a time when the vine was most depending upon them; while to put on such an amount of cow manure and top it with the excavated soil was to exclude air from the border and so keep it far too cold and wet. This winter you had better carefully lift all the roots within at least a foot of the surface, removing the soil and remaining manure; then after cutting away all dead or injured roots spread out the live ones in layers, two, four, and six inches from the surface, in some good substantial loam, with which a little bone meal may be used, but this is not indispensable if the loam is good, as waterings with liquid manure can be given when the vines are in full growth and carrying their crops. If the drainage of the border is poor have it improved.

National Chrysanthemum Society's Medals.—J. R.: We have carefully considered your communication with reference to the awards made for miscellaneous exhibits at the recent exhibition of the National Chrysanthemum Society, and fail to see that any useful purpose would be served in publishing it. The judges engaged by the society, with the assistance of an official who is well known for his judgment and impartiality, awarded certain medals to certain exhibits in accordance with their views as to the respective merits of the collections. You suggest they were altogether wrong in their awards, and the only point is whether you or the judges are right. We have heard a considerable amount of grumbling about the awards of medals at this exhibition, but so far as we have been able to discover the only substantial grievance is to be found in the fact that each exhibitor did not have a gold medal of higher value than everyone else.

Downward Growth of Roots.—R. B. T., Borrowash: Most of the treatises on elementary botany will give you the necessary information. We may state, however, that as far back as 1806 Knight demonstrated the influence of gravitation upon the downward growth of roots. He exposed seedlings to the continued action of centrifugal force by submitting them to rapid rotation either in the vertical or horizontal plane. It was shown that the growing root-apices behaved exactly as if they were simply projected from the centre of rotation, like the weight of a pendulum made with a thread and swung rapidly round in the hand, while the shoot of the seedling behaved in exactly the contrary manner and grew towards the centre of rotation. Another reason for downward growth is the greater amount of moisture received from below. The root increases in length by the multiplication of the cells situated immediately behind the root-cap, and such increase is dependent on a free supply of moisture. The pressure of the superincumbent soil and the direction of the root hairs, when present, also facilitate downward growth, and prevent the root from being pushed back.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

M. N., Malvern: 1, Kerrya japonica; 2, Spiræa Bumalda; 3, Polygonum molle; 4, Berberis Thunbergi.

W. H. H., New Wortley: We were unable to identify the plant from the specimen sent. If you could send another specimen, with particulars of habit, &c., we will do our best to assist you.

W. C., Wimbledon: The orchid was overlooked; it is evidently Epidendrum Godseffianum.

Clapham: 1, Selaginella cæsia; 2, S. apoda; 3, S. Kraussiana; 4, Tradescantia Zebina; 5, send fertile fronds; 6, Adiantum capillus veneris.

W. B., Birmingham: 1, Buxus sempervirens myrtifolia; 2, Abies Pinsapo.

E. B, Tooting: Probably a form of Ipomæa bignonioides.

J. B., Brentwood: 1, Dracæna Guilfoylei; 2, not recognised; 3, Areca lutescens; 4, Croton Lord Derby; 5, Justicia carnea; 6, Begonia Haageana.

J., Yatton: Cratægus coccinea; we believe the fruits have no poisonous properties, but they are scarcely edible.

H. E., Nottingham: 1, Davallia solida; 2, Oleandra nodosa; 3, Nephrolepis exaltata; 4, Davallia elegans; 5, Lomaria spicant var.; 6, Nephrolepis ramosa.

M. J., Tenby: 1, Adiantum formosum; 2, Daphne laureola; 3, Tamarix gallica; 4, send when in flower; 5 and 6, varieties of Quercus ilex, the Evergreen Oak.

Names of Fruits.—We are pleased to assist our readers as far as it is possible to do so in naming fruits, but it is absolutely necessary that they should send us good specimens carefully packed, as it is only when characteristic examples reach us in perfect condition that we are able to determine their names. We are compelled to insist on the observance of this rule, as so many specimens now reach us. We cannot undertake to name more than six varieties at one time; and both apples and pears should be sent when approaching maturity, but before they are fully ripe, that we may have the assistance of their distinctive colours in determining their identity.

X. Y., St. Albans: 1, Souvenir de Congrès; 2, not recognised.

G. M., Canterbury: The pear is Pitmaston Duchess, and the apple Cambusnethan Pippin.

S. G. R., Yalding: When unpacked, the fruits were rotting; they apparently represent Comte de Lamy.

Correspondents not answered this week will be good enough to consult our next issue.

C. L., Worcester: 1, American Mother; 2, Lady Henniker; 3, Dumelow's Seedling; 4, Lord Derby.

L. E. B., Uxbridge: No. 4 was not recognised; you may send another specimen, two if possible, as apples vary very much even on the same tree, and cannot always be identified from one example.

THE CHRYSANTHEMUM RUST.

THE conference recently held by the N.C.S. will undoubtedly lead to much good, and I should have liked to have taken part in the discussion, but was afraid I could hardly say what I wished to in the five minutes wisely limited to each speaker. I was particularly struck with the large attendance of growers, especially as it is only a few who admit that they are troubled with the "Rust on 'mums."

The various writers inform us "that they hear the rust is rather prevalent," but they have not noticed it in their collections. Still, it was surprising to note what a large number of those at the meeting seemed to be interested in the matter. During the past few weeks I have seen many collections, and in no instance have I failed in finding the disease. Its course seems peculiar and erratic. One collection of about three hundred plants was last year clear of the rust, although the stock the plants were raised from was infected. This season new blood was introduced in the way of fresh varieties, and these are now clean, although obtained from a stock which was badly attacked last season, but strange to say a few of those which were clean last year have recently become infested with the fungus, and no others. In many instances the varieties that were badly attacked last year are almost clean this, whilst those which suffered but little then are severely attacked this season.

It was rather to be regretted that trade rivalry sprang up at the discussion. Mr. Wells honestly stated that his collection was affected, and further said all trade collections were more or less suffering from the disease, a statement which was undoubtedly true.

During the season plants which were affected by the fungus were sent out by all the most important trade growers; at least, I received them as such, and further, I supplied hundreds of plants and cuttings which were more or less diseased to the members of the trade at the meeting. If the disease is only in the plants it proves that it makes but little difference whether the plants are procured from an infected stock or otherwise. All the principal trade growers obtain large quantities of stock from each other every season.

Mr. Wells says he can destroy the spores, but many will incline to the opinion of Mr. Massee that he cannot do so except by practically destroying the foliage. It is possible to treat the powdery matter so that it falls off, and also to prevent its spreading by rendering the foliage safe from infection. As to the disease dying out, I am afraid we cannot look forward to this with much hope. We have hollyhock and potato diseases with us more or less every season, and so it will be with the fungus on chrysanthemums. Perhaps we may raise varieties which will resist the disease.

As to preventives, there does not seem to be any difficulty in getting the stock clean during the summer, for stocks badly affected during the previous autumn and winter become apparently quite clean during the growing season, but towards the autumn, when the foliage is losing its vigour, the brown spots appear, and soon affect the whole plant. When once the disease has a good footing all attempts to stay its spread seem to be useless, and the only chance of keeping it at bay is to commence with the syringing of the stools with some of the various remedies prescribed, and also dipping the cuttings before insertion and the plants at every potting. Instead of syringing with clean or soot water every day, use a fungicide once or twice a week. Every few days make a diligent search for the disease, and, should it appear, burn every bit of infected foliage, taking great care to gather it carefully, and putting it into a covered tin in taking it to the fire, so that none can float in the air. As to remedies, Mr. Wells gives one which he has proved to be good. The Bordeaux mixture or a solution of sulphate of copper and lime is very simple and effective, but care must be taken to use the purest sulphate of copper. The rust in carnations is very similar to that affecting chrysanthemums, and it is giving much trouble to American growers, but the most effective remedy yet propounded is a decoction of arsenic; an ounce of this dissolved in a little alcohol, and mixed with 100 gallons of water, is the recipe, but it requires great care in using. That it is very efficacious I have proved.—W. J. GODFREY, *Exmouth.*

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, OCTOBER 31.—National Chrysanthemum Society; Floral Committee meets at one o'clock.
TUESDAY, NOVEMBER 1.—Scottish Horticultural Association.
Croydon Chrysanthemum Show; Two days.
Torquay Chrysanthemum Show; Two days.
Southampton Chrysanthemum Show; Two days.
Kingston Chrysanthemum Show; Two days.
Eastbourne Chrysanthemum Show; Two days.
Truro Chrysanthemum Show; Two days.
Stratford-on-Avon Chrysanthemum Show; Two days.
Hereford Chrysanthemum Show; Two days.
Walthamstow Chrysanthemum Show; Two days.
Watford Chrysanthemum Show; Two days.
WEDNESDAY, NOVEMBER 2.—Swindon Chrysanthemum Show; Three days.
Kent County Chrysanthemum Show; Two days.
Isle of Thanet Chrysanthemum Show; Two days.
Dorchester Chrysanthemum Show; Two days.
Jersey Chrysanthemum Show; Two days.
Wolverhampton Chrysanthemum Show; Two days.
Ascot Chrysanthemum Show; Two days.
Parkstone Chrysanthemum Show; Two days.
Brixton Chrysanthemum Show; Two days.
Woking Chrysanthemum Show; Two days.
Hertford Chrysanthemum Show; Two days.
Lowestoft Chrysanthemum Show; Two days.
Burgess Hill Chrysanthemum Show; Two days.
Portsmouth Chrysanthemum Show; Two days.
Dorking Chrysanthemum Show; Two days.
Barnet Chrysanthemum Show; Two days.
Westerham Chrysanthemum Show; Two days.
Uxbridge Chrysanthemum Show; Two days.
THURSDAY, NOVEMBER 3.—Reigate Chrysanthemum Show.
Colchester Chrysanthemum Show.
Forest Gate Chrysanthemum Show; Three days.
Woolwich Chrysanthemum Show; Three days.
Exeter Chrysanthemum Show; Two days.
North Peckham Chrysanthemum Show; Two days.
West of England Chrysanthemum Show; Two days.
Maidenhead Chrysanthemum Show; Two days.
Reigate Chrysanthemum Show; Two days.
Putney Chrysanthemum Show; Two days.
Manor Park Chrysanthemum Show; Two days.
Leamington Chrysanthemum Show; Two days.
Leyton and Leytonstone Chrysanthemum Show; Two days.
Finchley Chrysanthemum Show; Two days.
FRIDAY, NOVEMBER 4.—Battersea and Wandsworth Chrysanthemum Show; Two days.
Lizard Chrysanthemum Show; Two days.
Hinckley Chrysanthemum Show; Two days.
SATURDAY, NOVEMBER 5.—North of Scotland Root, Fruit, and Vegetable Show.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY, OCTOBER 31, and NOVEMBER 1, 2, 3, AND 4.—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.
WEDNESDAY, NOVEMBER 2.—Japanese Lilies, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E C.
TUESDAY AND WEDNESDAY, NOVEMBER 1 AND 2.—Roses, Carnations, Begonias, Hollyhocks, Lily of the Valley, &c, Messrs. Protheroe and Morris, Hale Farm Nurseries, Tottenham, N.
FRIDAY, NOVEMBER 4.—Imported and Established Orchids, Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.
NEARLY EVERY DAY.—Tulips, &c., Mr. J. C. Stevens, King Street, Covent Garden.

CATALOGUES RECEIVED.

C. PLATZ AND SON, ERFURT.—Novelties.
E. WEBB AND SONS, STOURBRIDGE.—Bulbs.
SHANNON CO., ROPEMAKER STREET.—Office Appliances.
HENRY NORTON, LOUTH, LINCS.—Roses.
COLLINS BROS. AND GABRIEL, WATERLOO ROAD, S.E.—Bulbs.
CHARLESWORTH AND CO., HEATON, BRADFORD.—Orchids.
H. DUNCAN CARR, KIMBERLEY ROAD, STOCKWELL, S.W.—Bulbs.
FOTHERINGHAM AND KING, DUMFRIES.—Bulbs and Roots.
ANT. ROOZEN AND SON, OVERVEEN, NEAR HAARLEM, HOLLAND.—Bulbs.

Chrysanthemum Rust.—Unless this disease can be effectually checked, it bids fair to become as great a trouble to our chrysanthemums as the other, puccinia, has been to our hollyhocks. Practically no real remedy in the way of an external application has been found for that, that is not harmful to the tender stems and leaves. Mr. George Massee has given information in relation to the life and growth of the rust, and what is to growers of more consequence, gives some information as to remedies, amongst which entire destruction of affected leafage is one. That is no doubt in many cases, if carried out, tantamount to destroying the plants. Where in all cases blooms are cut, the entire stem should also be cut low down, and be burnt. It is worthy of special attention whether plants growing out in the open ground are as liable to the attacks of the rust as are plants in pots, also whether highly-fed plants intended to produce large flowers are more or less susceptible to attacks. Then as to other remedies or dressings, applications in the form of sprayings of a solution of potassium sulphide, half an ounce to a gallon of water, is recommended as a preventive. Wide information should be furnished where the potassium sulphide can be purchased, and its price, also something of its nature, whether it be a poison or not. Scientists write easily of these various chemicals, but they are cavaire to the general reader. May not boulilie bordelaise be tried with some likely success. Mr. Massee states that when all the leaves die and fall, the plants are practically free from the disease. But when that happens in the course of nature, or where shoots and leaves have formed, are they clean or not?—A. D.

COMING EVENTS.

IN addition to the chrysanthemum shows already notified in our columns for the ensuing month, we give the following list of recently-received dates. Secretaries would much oblige us by notifying any alterations of dates at once.
NOV. 1 and 2.—Truro, Stratford-on-Avon, Hereford, Watford, Walthamstow.
NOV. 2 and 3.—Lowestoft, Burgess Hill, Portsmouth, Dorking, Barnet, Westerham, Uxbridge.
NOV. 3.—Reigate.
NOV. 3 and 4.—Putney, Leyton and Leytonstone, Manor Park, Grimsby, Leamington, Finchley.
NOV. 4 and 5.—Lizard, Hinckley.
NOV. 7 and 8.—Sevenoaks.
NOV. 8 and 9.—Coventry, Kidderminster, Clevedon, Bexley Heath, Sutton.
NOV. 9 and 10.—Hanley, Berkhamsted, Wimbledon, Southgate, Melton Mowbray, Bromley, Gloucester, Carlisle, Bodmin.
NOV. 10 and 11.—Sidcup, Southport.
NOV. 11 and 12.—Waterford, Altrincham, Wellingborough, Dalkey, Carnarvon, Blackburn.
NOV. 15.—Liscard.
NOV. 15 and 16.—Chester, Stirling, Great Yarmouth.
NOV. 16 and 17.—Chippenham.
NOV. 17 and 18.—Lincoln.
NOV. 17, 18, and 19.—Norwich.
NOV. 18.—Wrexham, Broughton-in-Furness.
NOV. 18 and 19.—Bolton.
NOV. 19.—Arbroath.
NOV. 25 and 26.—Dunfermline, Aberdeen.

MARKETS.

Covent Garden.

FRUIT is selling well, and there is no difficulty in clearing the supplies that come to hand. The supply of greenstuffs is shortening somewhat, consequently prices are slightly enhanced.

FRUIT.—English apples, 4s. to 8s. per bushel; Nova Scotian, 15s. to 28s. per barrel; French pears, 2s. 6d. to 5s. per case, 7s. to 12s. per crate; Californian, 5s. 6d. to 8s. per half-case; bananas, 5s. to 10s. per bunch; pineapples, 2s. to 4s. 6d. each; English grapes, 9d. to 2s.; Channel Island, 6d. to 1s. per lb.; Almeria, 10s. to 17s. per barrel; peaches, 2s. to 8s.; green figs, 9d. to 1s. 6d. per dozen; cobnuts, 40s. to 50s. per 100 lb.; walnuts, 4s. to 5s. per bushel; lemons, 15s. to 25s. per box; pomegranates, 4s. to 6s. per case; celery, 12s. to 18s. per dozen rolls; English tomatos, 3s. 6d. to 4s. 6d.; Channel Island, 2s. 6d. to 3s. 6d. per 12 lb.; Bordeaux, 2s. 6d. to 3s. 6d. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 3s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 3s. to 4s.; tea roses, 6d. to 1s.; pink roses, 1s. 6d. to 3s.; red roses, 6d. to 1s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Turnips, 3s. to 4s.; carrots, 2s. 6d. to 3s. 6d.; parsley, 2s. to 2s. 6d.; leeks, 1s. 6d. to 2s. per dozen bunches; Valencia onions, 6s. 6d. to 7s. 6d.; Ports, 6s. to 6s. 6d. per case; Dutch, 3s. to 3s. 6d. per bag; spinach, 3s. to 4s. per bushel; cauliflowers, 1s. 6d. to 3s.; cucumbers, 2s. 6d. to 4s. 6d.; endive, 1s. 2d. to 1s. 10d.; lettuce, 1s. 3d. to 1s. 9d.; French, 2s. to 3s. per dozen; cabbages, 4s. to 9s. per tally; mushrooms, 2s. 6d. to 3s. 6d. per peck; eschallcts, 1s. 6d. to 2s. per 12 lb.; potatos, 60s. to 90s. per ton.

Borough Potato Market.

Average supplies arrive, but trade is improving and there is a decided tendency towards a quotable rise in prices. Beauty of Hebron, Up to Date, and Snowdrop, 75s. to 80s. per ton; White Hebron, Early Puritan, Bruce Magnums, Sutton's Early Regent, Reading Giant, and Imperator, 65s. to 70s.; and Blacklands, 60s. to 65s. per ton.

THE WEATHER DURING THE WEEK ENDING OCTOBER 22, 1898.

Hull	65·0	45·0	52·5	11·39	2·25	5·71

The mean reading of the Barometer during the week at Greenwich was 29·25 inches, and that of the Thermometer 55°·3, the latter being 6°·1 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 1 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 10·9 hours. The measured rainfall amounted to 1·42 inches.

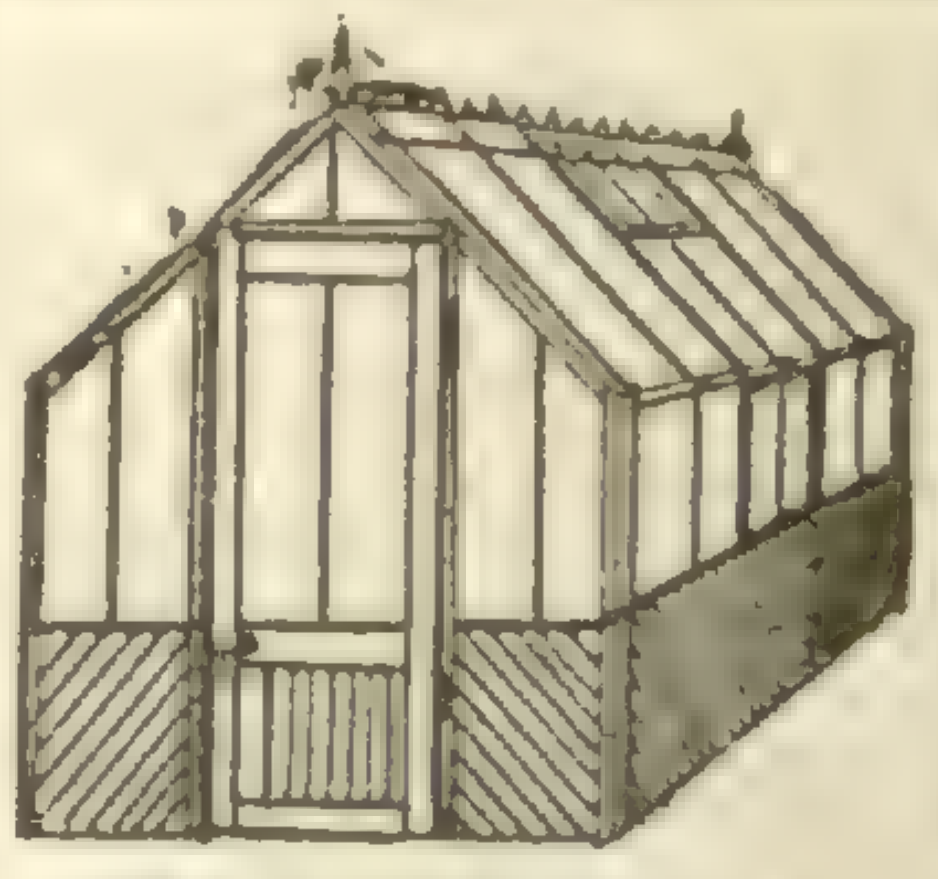
SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

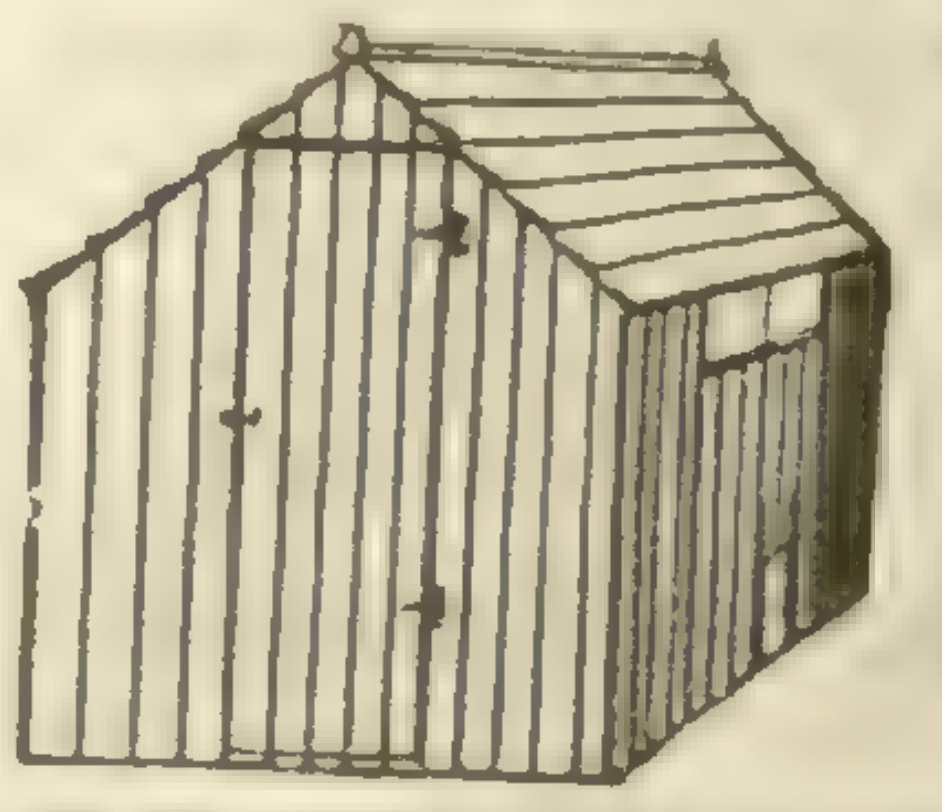


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more?

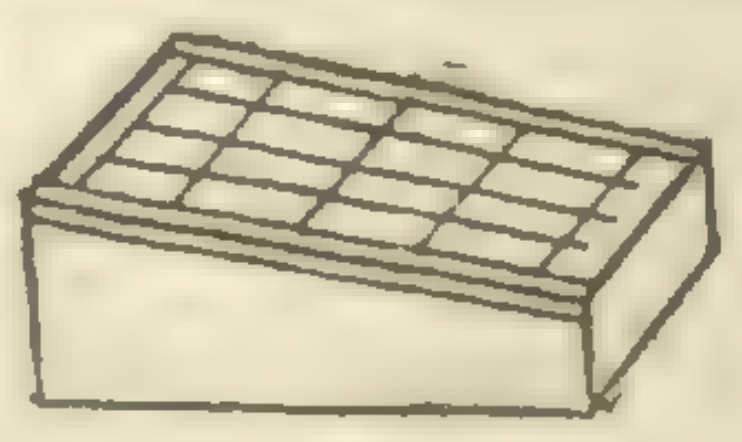
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to.	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17,6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half inch wood, these are one-third thicker, and felt cover to roof.



4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21 oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

Apply for List to—

HYPOLITE, DEPTFORD.

CANNELL'S CHRYSANTHEMUMS.

Come and See.

AN enormous amount of evidence confirming our special system, first adopted by us for propagating from properly prepared stock, from pure, clean, healthy, open-field grown stools, free from fungi, has come to light, and is still coming and proving more and more that ours are far the best, the key to success, and win more victories than, perhaps, all others put together.

Please remember our forte and aim is stock of the best quality, carrying satisfaction all over the world. The following is unmistakable:—

"Mr. H. ADAM, Hon. Secretary,
"Dunedin Chrysanthemum Club, New Zealand,
"September 13, 1898.

"We received the chrysanthemums. I am instructed by my committee to thank you very much for your liberal treatment. The plants arrived in splendid condition; only two died out of the 44; forward me your catalogues, as you can rely on us ordering.

"H. Cannell and Sons, Swanley, Kent."

DON'T BELIEVE ME! COME!

and see for yourself that my Stock of Chrysanthemums is absolutely free from Rust or Disease of any kind.

Inspection cordially invited.

Catalogues now ready, Post Free 1d.

VEITCH'S
GENUINE BULBS

VEITCH'S COLLECTIONS
Of HYACINTHS,

Selected from the most distinct named varieties.

VEITCH'S COLLECTIONS
Of DAFFODILS,

Embracing the finest of each section.

VEITCH'S COLLECTIONS
Of TULIPS,

Containing the most effective kinds for pots.

For details see CATALOGUE, forwarded Post Free on application.

JAMES VEITCH & SONS (Ltd.)
ROYAL EXOTIC NURSERY,
CHELSEA, LONDON, S.W.

The ONLY House supplying First Size named **HYACINTHS** at **3**d. per root. As we are Growers, we save customers all middlemen's profits. The small advance in price is solely due to the great scarcity and unusual demand this season.

Roman Hyacinths, selected bulbs, 10,6 per 100, 1/6 per doz.

All our Bulbs are Guaranteed First Size ONLY.

DUTCH BULBS.

DUC VAN THOL TULIPS.
Scarlet, 2 6 per 100.
Red and Yellow, 2/6 per 100.
Single Mixed Tulips, 2/6 per 100, from finest named varieties.
All other Bulbs equally as cheap and reliable.

Catalogues free on application.

M. RAINS & CO.,
Bulb Growers & Seed Merchants,
34, Mansell St.,
ALDGATE, LONDON, E.C.

NEW CALLAS,
OR
ARUM LILIES.

"THE GODFREY."—Whiter than ordinary variety; earlier; requires less room, and will give five times the number of spathes from the same space.

"DEVONIENSIS."—Dwarfer and slightly smaller than the above, but even more floriferous.

Good plants, **2 6** each; small plants, **1/6.**

W. J. GODFREY,
EXMOUTH, DEVON.

754 BULBS FOR 20/-.

All [illegible] flowering bulbs, including 50 named Hyacinths in six distinct colours, 25 large Trumpet Daffodils, 25 Nonsuch Daffodils, 100 Snowdrops, 200 Crocus in four separate colours, 50 Tulips, with a liberal number of Anemones, Iris, Scillas, Jonquils, Gladiolus, &c

For full list and number of varieties see Catalogue.

BENJN. SODDY, "B" Dept.,
243, Walworth Road, London, S.E.

BARR'S GOLD MEDAL DAFFODILS
The Most Lovely of all Spring Flowers.

SEND for BARR'S DAFFODIL CATALOGUE, illustrated with original photographs taken at the Long Ditton Nurseries, and containing a Descriptive List of all the finest Daffodils in cultivation and the latest Novelties for 1898 Free on application.

A FEW FINE SORTS FOR POTS OR OUTDOORS.

Emperor, petals primrose, trumpet full yellow, large flower of great substance. Per 100 30/-, per doz. 4/6.

Henry Irving, one of the earliest, very large flower, fine deep golden yellow. Per 100 21/-, per doz. 3/-.

Queen of Spain, very beautiful delicate soft yellow, with reflexing petals. Per 100 17/6, per doz. 2/6.

Bicolor Horsfieldii, petals pure white, trumpet golden, handsome; very early Per 100 17/6, per doz. 2 6

Incomparabilis Sir Watkin, a very handsome large flower, petals sulphur, cup rich orange-yellow. Per 100 25/-, per doz. 3 6

Barrii conspicuus, broad yellow petals, cup conspicuously edged bright orange-scarlet; a beauty, and a general favourite. Per 100 17/6, per doz. 2/9

Leedsii M. M. de Graaff, broad white petals, white cup suffused orange, very beautiful. Per doz. 8/-.

Triandrus albus (Angel's Tears), a gem on rock-work, pretty cream-coloured flowers, petals reflexed. Per 100 8/6, per doz. 1/3.

Poeticus Poetarum, most beautiful of the White Poets' Daffodils. Per 100 12/6, per doz. 1/9.

BARR'S General BULB CATALOGUE containing a descriptive List of the best Bulbs and Tubers for autumn planting, and a List of Bulbs and Plants for early forcing, *free on application.*

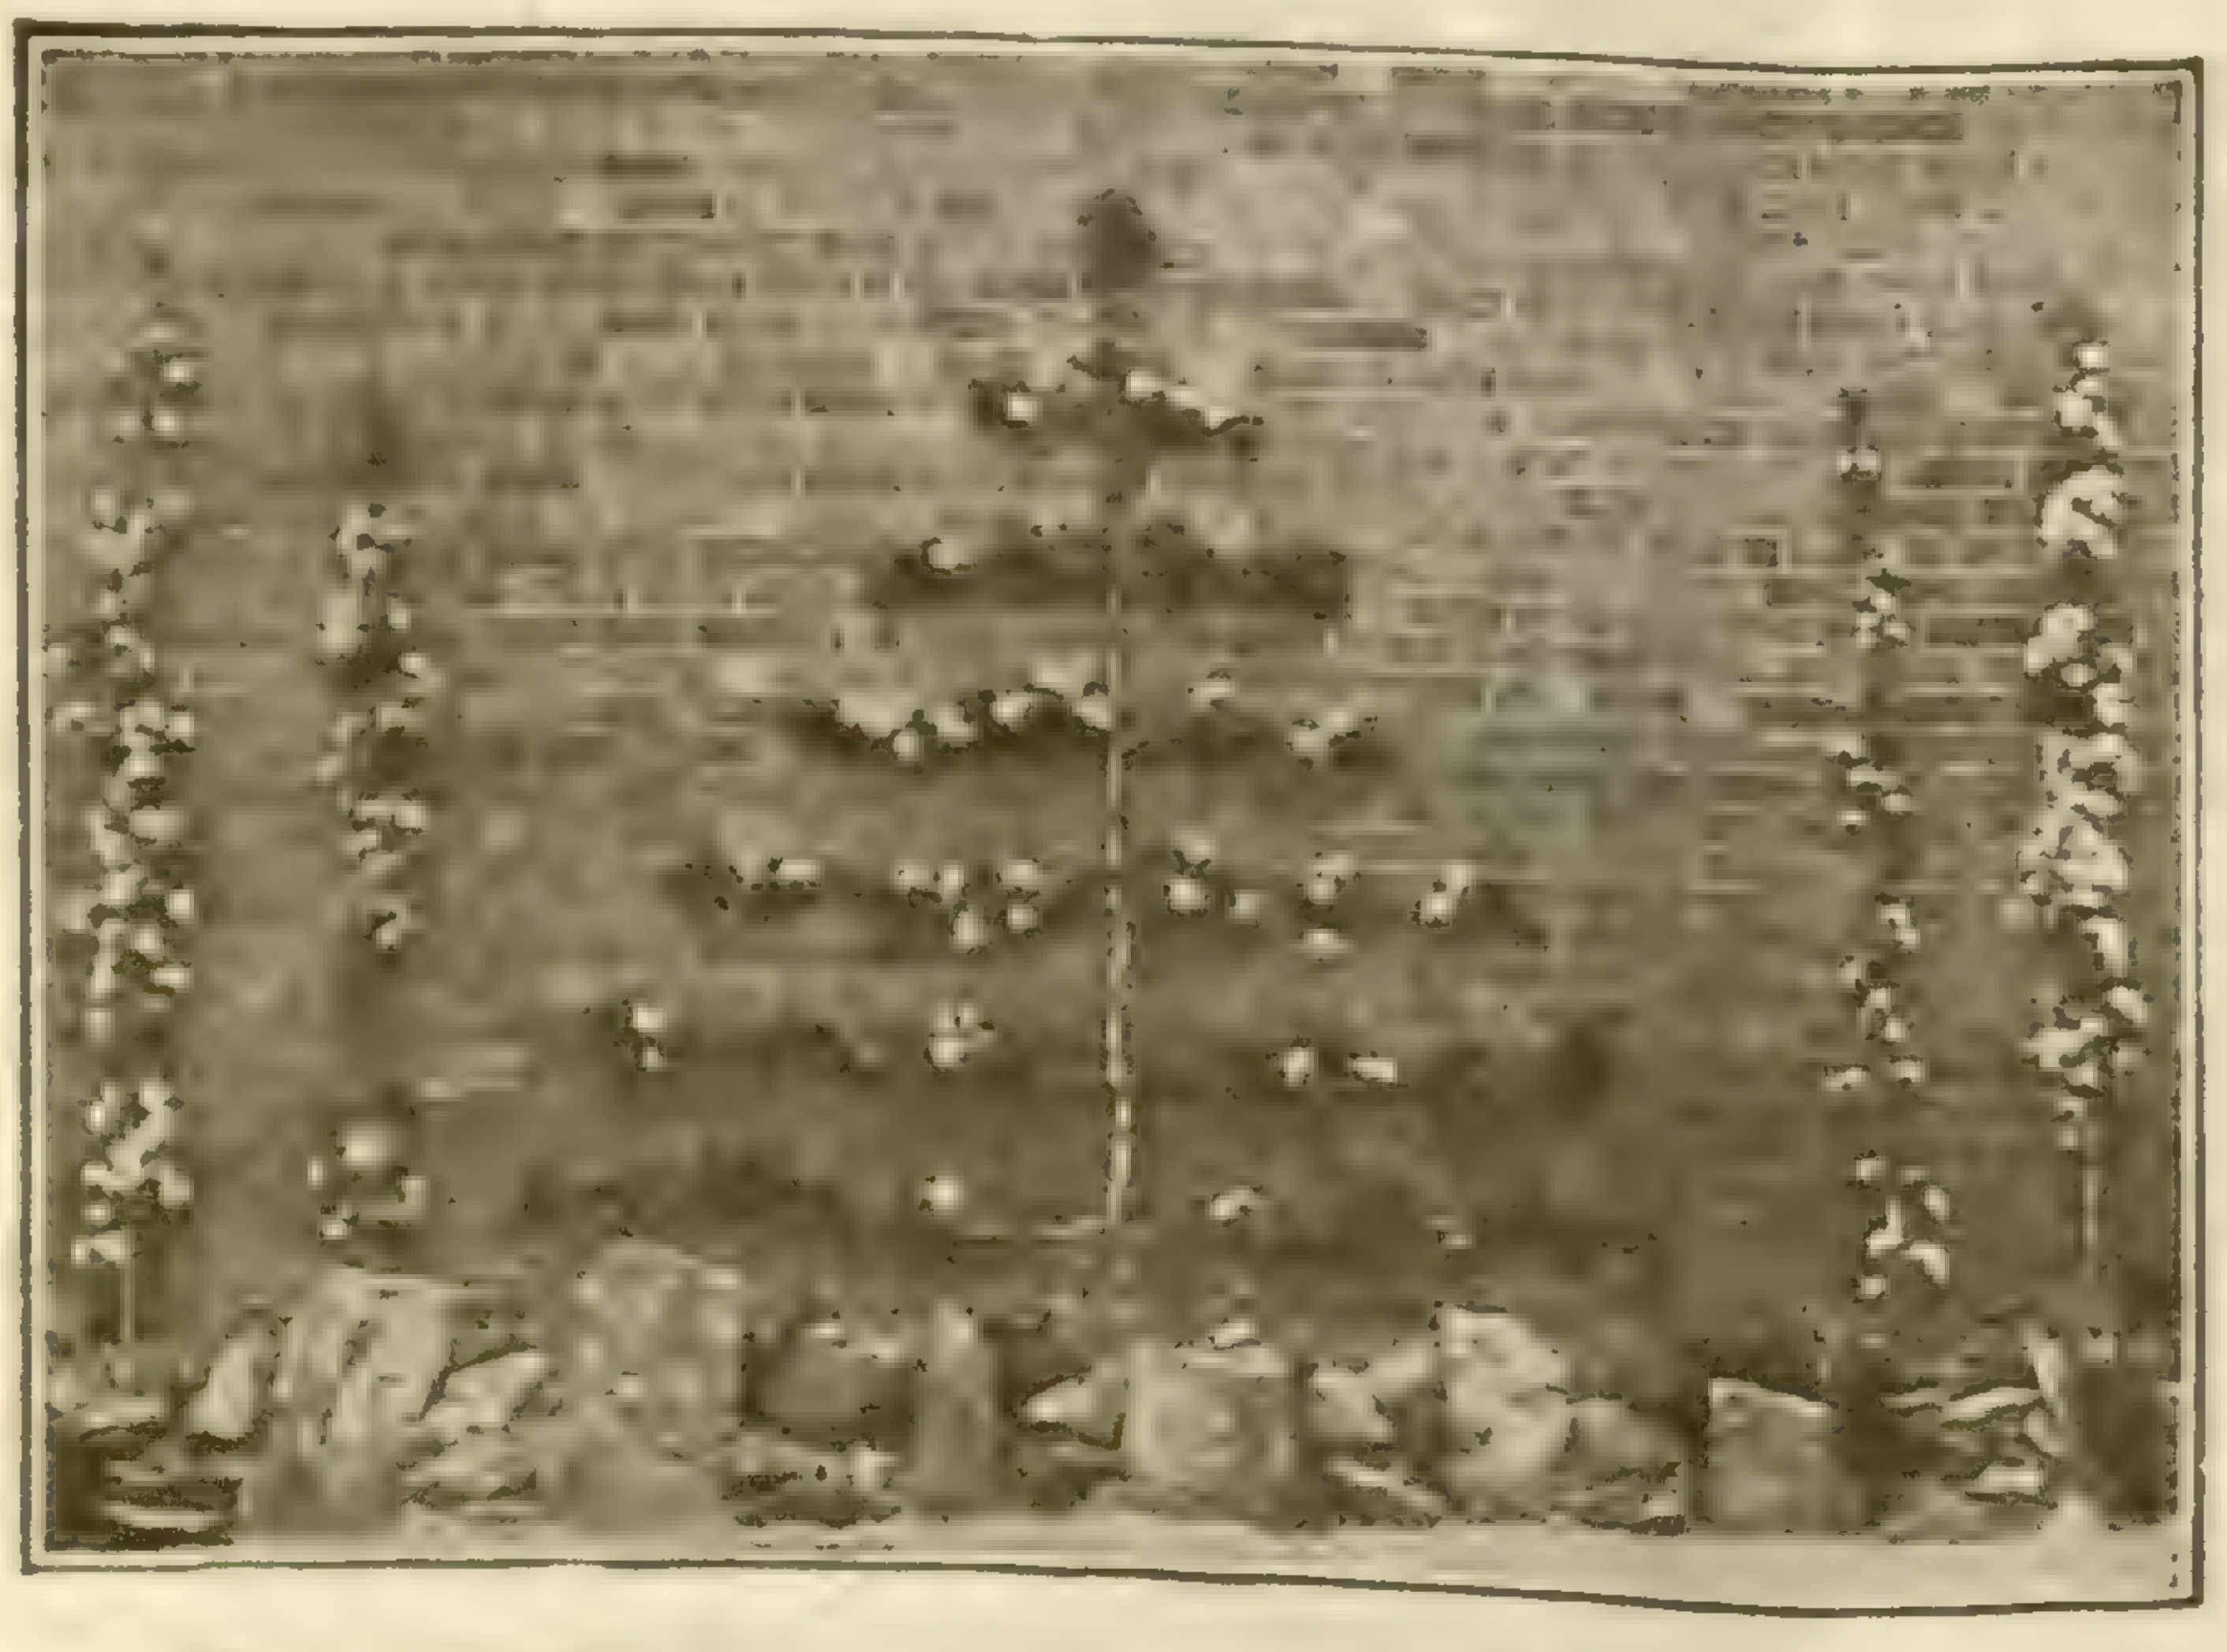
PROFITABLE GARDENING. By the late SHIRLEY HIBBERD. Illustrated Work on the Culture of Vegetables, Fruits, and other Garden Produce.
Price 3/6.
W. H. & L. COLLINGRIDGE, 148 & 149, Aldersgate St., London.

FIELD FLOWERS. By the late SHIRLEY HIBBERD. With Eight Coloured Plates and Engravings, Describing the wild flowers of each month.
Price 3/6.
W. H. & L. COLLINGRIDGE, 148 & 149, Aldersgate St., London.

AN AGE OF SPECIALISTS.

20,000 Trained Trees to Select from!
50,000 Apples on Paradise!

For considerably over a century our firm has been noted for the careful cultivation of Fruit Trees, and has built up a reputation by sending out Trees **TRUE TO NAME.** During the past Sixteen Years we have greatly **extended our culture of Fruit Trees,** and, having given up the cultivation of all General Nursery Stock in favour of these, and Roses, we may fairly claim to be **Fruit Tree Specialists.** To-day we are pushing the matter still closer, and make a Speciality (without neglecting other branches of Fruit Tree Culture) of



Photograph from Customer, of Trees planted the previous Autumn.

ESPALIER TRAINED TREES.

Last Season we had a **Stock of over 20,000,** a stock which for excellence or number we believe to be without parallel. We have **Apples, Pears,** and **Plums** trained in this form. **Peaches, Nectarines, Apricots, Cherries,** &c., as fan-trained Trees. We were the first to grow **Plums** as horizontally trained Trees, a method which suits them infinitely better than any other.

DESCRIPTIVE CATALOGUE, with article on Planting, Pruning, &c., 6d.; Gratis to Customers.

J. R. PEARSON & SONS, CHILWELL NURSERIES, NOTTS.

THE GARDENERS' MAGAZINE.

SATURDAY, NOVEMBER 5. 1898.

NATIONAL CHRYSANTHEMUM SOCIETY.
ROYAL AQUARIUM, WESTMINSTER,
NOVEMBER 8, 9, and 10, 1898.
GREAT AUTUMN CHRYSANTHEMUM FESTIVAL.
Specimen Plants, Groups, Cut Blooms, Fruit and Vegetables. The Largest Chrysanthemum Show in the United Kingdom.

Schedules of Prizes from
RICHARD DEAN V.M.H., Secretary and Superintendent, 42, Ranelagh Road, Ealing, W.

BRADFORD and DISTRICT CHRYSANTHEMUM SOCIETY.—TWELFTH ANNUAL EXHIBITION in ST. GEORGE'S HALL, NOVEMBER 11 and 12. £150 in prizes, four Silver Cups, and three Gold Medals to be competed for. Entries close November 7. Schedules, &c., to be had from
R. EICHEL, Hon. Secretary, Westcliffe Road, Shipley.

DERBY CHRYSANTHEMUM ASSOCIATION. — FOURTEENTH ANNUAL EXHIBITION.
ROYAL DRILL HALL, NOVEMBER 11 AND 12.
Entries close November 7. Schedules and particulars from
H. J. BELL, F.R.H.S., Hon. Sec., Normanton Road, Derby.

HULL.—The 15th ANNUAL CHRYSANTHEMUM SHOW of the HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY will be held in the ARTILLERY BARRACKS, HULL, on WEDNESDAY and THURSDAY, NOVEMBER 16th and 17th.
Entries close November 9th.
Schedules free from the Hon Secs.,
EDWARD HARLAND, Manor Street, Hull.
JAMES DIXON, F.R.H.S , 2, County Buildings, Hull.

LEEDS PAXTON SOCIETY'S CHRYSANTHEMUM SHOW, TOWN HALL, LEEDS, TUESDAY and WEDNESDAY, NOVEMBER 15 and 16. Upwards of £180, including four Challenge Cups, will be given in prizes. Schedules from the Hon. Sec.,
JAMES CAMPBELL, The Gardens, Methley Park, Leeds.

READING CHRYSANTHEMUM SOCIETY.—ANNUAL SHOW of CHRYSANTHEMUMS and FRUIT, TOWN HALLS, WEDNESDAY, NOVEMBER 16.
W. L. WALKER, Secretary, Balmer tie Road, Reading.

RUGBY CHRYSANTHEMUM EXHIBITION, NOVEMBER 16 AND 17, 1898. Entries close November 9.
WILLIAM BRYANT, Secretary, 8, Barby Road.

SHEFFIELD CHRYSANTHEMUM SOCIETY.—ANNUAL SHOW
CORN EXCHANGE, SHEFFIELD, NOVEMBER 11 AND 12, 1898.
£200 in Prizes. Schedules free on application to
W. HOUSLEY, Secretary,
28, Joshua Road, Sheffield.

WIMBLEDON AND DISTRICT ROYAL HORTICULTURAL AND COTTAGE GARDEN SOCIETY.
The ANNUAL EXHIBITION of CHRYSANTHEMUMS, VEGETABLES, FRUIT, &c., will be held in the DRILL HALL, WIMBLEDON, on WEDNESDAY and THURSDAY, NOVEMBER 9 and 10
Schedules and particulars of the Hon. Sec., W. S. THOMSON, The Nurseries, Wimbledon.

YORK CHRYSANTHEMUM SHOW.—The NINETEENTH ANNUAL SHOW will be held NOVEMBER 16, 17, and 18, 1898. Upwards of £200 offered in Prizes, in liberal proportions, for Plants, Cut Flowers, Fruit, and Vegetables.
Schedules, &c., to be had from
J. LAZENBY, 13, Feasegate, York.
Challenge Prize, value £20, added to 1st Prize (£10) for 36 Cut Blooms. £7 and Cup (£5) for Group. Entries November 9.

THE ROYAL GARDENERS' ORPHAN FUND.

The ELEVENTH ELECTION of CHILDREN to the benefits of this Fund, consisting of an allowance of 5s. per week (subject to the conditions stated in Rule XIII), will take place on FEBRUARY 17 next at ANDERTON'S HOTEL, FLEET STREET, E.C.
All applications must be made on a printed form, copies of which may be had gratis of the Secretary or of any of the local Secretaries Such form must be correctly filled up, duly signed, and returned to this office not later than TUESDAY, DECEMBER 20.
A. F. BARRON, Secretary, 13, Sutton Court Road, Chiswick.

HORTICULTURAL CORRESPONDENCE CLASSES.—For PROSPECTUS and LIST of PRIZES apply T. H. SMITH, 18, Somerville Road, Small Heath, Birmingham. First Examination Paper ready November 5. Join early for the whole course.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at One Shilling per line, the minimum charge being Five Shillings. Advertisement Office, 148 and 149, Aldersgate Street, London, E.C.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

THE CHRYSANTHEMUM SEASON.

CHRYSANTHEMUMS have for some time past contributed liberally to the attractions of the garden, and where full advantage has been taken of the wealth of material to be found in the early-blooming section the borders have throughout the past month presented a bright appearance, and yielded an abundant supply of cut flowers for the decoration of the house. Under glass, the fantastic and gaily coloured Japanese and the formal incurved have for two or three weeks past been sufficiently in bloom to produce an attractive display and quicken the interest in the important group of plants to which they belong. But the chrysanthemum season, from the exhibitor's point of view, did not commence until the past week, and so numerous were the competitive gatherings during the second and third days that sufficient have been held to indicate the character of the season. It has afforded us an immense amount of satisfaction to have unquestionable proofs, in crowded buildings, that there is no diminution in the interest taken by the general public in the golden flower, which brings so much of brightness and beauty into what is admittedly the dullest period of the year, and thus be in a position to state that those who are careful to introduce new features into their exhibitions may proceed with their good work with the assurance of substantial support. Of the general character of the season it is yet early to speak otherwise than with some reservation ; but as far as it is possible to judge from the exhibitions at which we have been present, the collections in gardens we have seen, and the reports of our correspondents, we are of opinion that the present season will hardly be up to the high average of recent years. There will be large and attractive displays at the exhibitions, but there is a probability of the quality of the greater proportion of the blooms staged being lower than usual. We hear on all sides of many buds on the finest Japanese varieties opening slowly and unsatisfactorily, and Madame Carnot, so finely shown last year, is this season especially disappointing in not a few collections from which we received information. Indeed, one grower states : "I have a score of plants of Madame Carnot and its sports, from which I shall not cut more than half a dozen exhibition blooms." The incurved varieties appear to be even more unsatisfactory than the Japanese, for the buds have not expanded well, and so far the blooms that have attained their full development have been wanting in the high finish which forms so great a charm of the section. We have already seen considerable numbers of rough incurved blooms on the exhibition tables, and, although we shall expect an improvement in the later flowers, we must be prepared for some amount of roughness in the section, and especially is this likely to be the case where many of the varieties that are intermediate between the older incurved varieties and the Japanese are grown. The cause of this lack of quality in the several sections is not difficult to understand. It is not due as some of our friends would have us believe, to the disease popularly known as chrysanthemum rust, for in no case that has come under our notice has the attack been so severe as to bring about the results of which cultivators are complaining. In our opinion the cause of the failure of so large a proportion of the plants to produce blooms of high quality has been the unfavourable climatic conditions that obtained during the summer months. Until midsummer the weather was for the most part cold and dull, and this was followed by a period of excessive heat and drought, which continued until quite the end of September, and imposed a check upon the growth, and brought about a premature ripening of the tissues. This point is of interest, for, if its significance is fully appreciated, it will be at once understood that any falling off in quality which may be noticed has not been due to lack of skill on the part of the cultivators, but to conditions over which they have no control.

THE PHILOSOPHY OF THE APPLICATION OF WATER.

HOW often one hears the question put, "How many times a day must I water this plant?" The querist evidently regards the plant in the light of an animal, needing so many meals a day to sustain life ; and it matters not what may be the time of the year, or the weather, or the condition of the plants, whether at rest or active, this question is put. Now there are great differences in respect of the quantity of water plants can endure without being materially injured by it, but with the exception of such as grow wholly submerged there are none that may not be hurt by an oversupply at some stage of their growth. The principle, indeed, is a perfectly general one, modified in innumerable ways, no doubt, according to the varying nature of the plants, but still, in itself, one and invariable. Inflorescence, and the act of pollination, which is the natural purpose of all flowering plants, must be performed in dry air and not in water. We have proof of this everywhere around us ; for in orchard, in cultivated fields, in garden, and in wild nature an over-rainy season during the flowering period is invariably accompanied both by decreased numbers and beauty and diminished fertility of the flowers. Anyone who chooses may verify this by his own observation, in what part of the country soever he happens to be situated ; and if this is the case with an excess of natural rain, much more must it be the case with an excess of artificial watering—a process which is always more clumsy and less beneficial than watering by the natural rains of heaven. Let it be understood that there are two living processes which seasonably follow each other in a healthy and fertile plant—the growth of the plant itself as an individual of one generation of its race, and the elaboration of the flower and parts of fructification which are wholly to be separated and cast off whenever the seed arrives at such maturity as that it is in a condition for generating if placed in a position proper for that purpose. These two operations may go on together in the same plant, but never in the same part of it ; and if they go on together each of them tends to weaken the other. Knowing this and paying careful attention to the differences between the circumstances which stimulate these two kinds of vegetative action, we are enabled to so feed the plant as to make it run more to individual growth or more to flowering, according as we may desire the one or the other. If we would have a large and handsome plant we must keep down, or, if necessary, entirely suppress, the flowering until these properties are obtained; and if, afterwards, we would have the flowering profuse and luxuriant, in proportion to the previous growth of the plant, we must repress its growth as a plant, and, as far as we can, direct the whole of its energy to the production of flowers. This is what every successful florist does in reality, whether he understands the principle upon which he proceeds or not; and our object is to make him, in so far as we have gone, at least acquainted with the principle. The grand distinction between these two kinds—we might almost call them successive generations—of life in the same plant is this: the growth of the individual plant works more by heat with moisture, and the flowering works more by heat and light and a diminished supply of moisture. Light is, indeed, necessary to the healthy individual growth of all plants, excepting the very few which grow in mines and places absolutely dark, none of which actually bloom; and moisture is necessary to bring on the flowers until they are nearly perfected, and begin to expand their petals, for until they do this they are still parts of the parent plant, and possess the same kind of vegetable life with the rest of it; but when they are perfected, and fertilisation is about to take place, the grand function of the flower is directed to the originating of a successional plant by means of the seed, and though, while the seed is advancing towards ripeness or maturity, it still depends upon the parent plant for its nourishment, it is not, physiologically speaking, any part of that plant as an individual, and cannot in any way, or to any extent whatever, promote the additional growth of its parent.

The "Gardening Year-Book" for 1899 being now in course of preparation, the Editor desires the assistance of secretaries of horticultural societies in making the list of horticultural and botanical societies in the United Kingdom as complete and useful as possible for the forty-first issue. Notification of change of address and secretary, and dates of exhibition for next year, should be sent at once to the Editor, "Gardening Year-Book," 148, 149, Aldersgate Street, E.C. Information with regard to newly-formed societies will also be gladly welcomed.

Apple and Pear Orchards and their Produce.—The paper by Mr. Radcliffe Cooke, M.P., on this subject, which was read before the Farmers' Club on Monday, dealt with the cider industry of this country. The actual process of cider-making, he pointed out, is simple enough. The real difficulties begin after the expressed juice is put into the casks for the purpose of fermenting. The first or tumultuous fermentation, which involves an effort to get rid of the matters in suspension in the liquid, is the essential predecessor of the vinous fermentation If the cider be allowed to ferment until all the sugar has been converted into alcohol it loses it sweetness and becomes dry, or, as it is usually termed, "hard." In this state it is preferred by many cider drinkers, and by those whose constitutions will not allow them to drink any liquor containing sugar. But there is always danger lest, vinous fermentation having come to an end, acetous fermentation should follow, with the result of turning the liquid into something akin to vinegar. With the object of arresting fermentation at the desired stage resort is made to the use of preservatives which destroy the ferment germs. The propriety of employing such materials as boracic acid, salicylic acid, formalin, and saccharin was criticized. The main reason why saccharin and preservatives are used is, according to Mr. Radcliffe Cooke, that they save labour, expense, and trouble, and enable poor stuff to be palmed off on the consumer. Worse, however, than this are those cases in which liquor containing no apple-juice whatever is put on the market under the name of cider. One such proved on analysis to consist of water, sugar, burnt sugar, and a dangerous drug employed to convey the flavour of pear juice. English makers of cider and perry were urged to produce pure liquors of fine quality, as in these they have no rivals. American cider was described as merely a sweet drink without much merit, and French ciders were said to be weak and washy compared with ours. The necessity of planting new orchards of vintage fruit and of renovating existing orchards was insisted on, and attention directed to the useful work in progress under the auspices of the technical education committees of the Hereford and Monmouth County Councils. Aided in such ways our cider trade should, Mr. Cooke belives, regain its former importance.

Paris Universal Exhibition of 1900.—The plans of the Horticultural Section at the Paris Exhibition of 1900 are now complete, and it promises to be a very attractive building. Space has been secured for British exhibitors, and it is hoped that it will be filled in a manner to reflect credit on horticulture in this country. It is understood that there will be periodical shows of flowers and fruit during the continuation of the Exhibition. A sub-committee of the Royal Commission, composed of the following gentlemen, has been formed: Sir J. Trevor Lawrence, Bart., Sir Edward Grey, Bart., M.P., W. T. Thiselton Dyer, Esq., Dr. Masters, Dr. Schlich, T. A. Dorrien Smith, Esq., and Harry J. Veitch, Esq. The latter gentleman is the honorary secretary to the sub-committee, and any communications may be addressed to him, or to the Secretary, Royal Commission, Paris Exhibition, St. Stephen's House, Westminster, S.W.

Coloured Drawings of Burmese Orchids.—The widow of the late Rev. Charles Samuel Pollock Parish has presented Kew with two folio volumes of coloured drawings of orchids, executed by him. Long before orchid growing had become so popular as it is now, that is to say, in 1852, Mr. Parish went to Moulmein, in Burma, where he remained until 1878. He was early attracted by the variety and beauty of the orchids, and began studying, drawing, and cultivating them. He also introduced a large number of living plants into this country. Almost from the first he was in correspondence with Kew, and a contributor to the Herbarium and Gardens. When he came home in 1871 he presented a beautiful collection of water-colour drawings of orchids. These are accompanied by admirable analyses of the flowers. On his return to Burma he continued to send specimens and sketches or tracings of his original drawings. Now, in accordance with his wishes, Kew possesses the whole of his original, elegant, and accurate drawings; a most valuable addition to the existing collection. In conjunction with the late Dr. H. G. Reichenbach, he published descriptions of a large number of new orchids in the *Transactions* of the Linnæan Society (vol. xxx., 1873), illustrated by a number of plates from his own pencil. Parish also contributed the part dealing with the orchids in Theobald's Mason's *Burma* (1883), upwards of 350 species being enumerated, nearly all from the province of Tenasserim, and including seventy-two species of dendrobium. Among the many species introduced by him into cultivation are Sarcanthus Parishi, Hook f. (*Bot. Mag.*, t. 5217); Dendrobium senile, Parish (t. 5520), and the highly curious Bolbophyllum lemniscatum, Parish (t. 5961). In 1870 Sir Joseph Hooker dedicated the ninety-sixth volume of the *Bot. Mag.* to him, as a tribute to the value of his many contributions to Kew, and to the plates of that publication. Mr. Parish died on October 18, 1897, at the age of seventy-five years.

Chrysanthemum Rust.—Messrs. J. R. Pearson and Sons, of the Nurseries, Chilwell, write: "Referring to Mr. Godfrey's letter in your last issue, we do not think that his rather sweeping assertion as to the universality of the disease should be allowed to pass uncontradicted. We ourselves received diseased plants in the spring from several sources, but by careful quarantine and constant treatment with fungicides succeeded in getting rid of it, and we believe our collection is absolutely clean at the present moment, and there may probably be a number of others equally fortunate."

Plants of the Coal Measures.—At the recent meeting of scientists Dr. Scott, keeper of the Joddrell Laboratory, Kew, gave a brief account of a part of his recent work on the anatomy of coal-measure plants; the most important of his contributions was a description of the structure of a new form of the genus Medullosa from the lower coal-measures of Lancashire. This extinct type of Palæozoic plants has not hitherto been recorded from a British locality, and has not previously been found in rocks of lower coal measure age. The material on which the description was founded was obtained by Mr. Lomax, and the excellent sections, of which micro-photographs were shown on the screen, were prepared by this able worker. Dr. Scott showed that the type of structure represented by the Lancashire Medullosa is that of a polystelic Heterangium, which bore Myeloxylon petioles. The same author exhibited photographs of an unusually fine specimen of the Halonial branch of a Lepidodendron, allied to L. fuliginosum, recently discovered by Mr. Lomax. Other contributions by Dr. Scott dealt with an English example of the interesting Palæozoic fern Botryopteris, and with a remarkably fine example of Zygopteris from the Williamson collection of coal-measure plants in the British Museum.

National Rose Society.—The committee of this society will meet at Hotel Windsor on Tuesday at the usual hour (three p.m.), and, as is customary at the meeting held in the month preceding the annual, there will, we have no doubt, be a large muster of members, notwithstanding the counter attractions of the chrysanthemum exhibitions.

Ancient Society of York Florists.—This old and flourishing society has a chaplain as well as an able executive, and much to the regret of the members the Rev. H. Vyvyan, who has held the office during the past four years, has found it necessary to resign the position in consequence of his having accepted a living in Cornwall. The committee decided to recognise the value of the services rendered by Mr. Vyvyan, and on the 28th ult. they presented him with an illuminated address, in which they express their appreciation of the work he had accomplished, the regret they felt at his leaving the city, and their best wishes for his health, happiness, and success in his new sphere. The presentation was made by Mr. J. Pillmoor in appreciative terms. Mr. Councillor Staines, Mr. J. Lazenby, and several other members of the executive testified to the esteem in which Mr. Vyvyan is held. In acknowledging the honour done him, Mr. Vyvyan said that his appointment as their chaplain was a great honour, and he desired to thank them for the kindly manner in which they had always treated him. Although he was going so far away, he should still continue to be a member, and would try to come year by year to their shows. His new home was ten miles from the nearest station and close to the Atlantic, and in the neighbourhood grew many very rare plants and flowers, some of which were to be found in no other places in the kingdom. He should always be pleased to be visited by any of his fellow members.

Royal Horticultural Society.—The several committees of this society will meet on Tuesday next at the usual hours, and at the afternoon meeting the Rev. George Henslow, V.M.H., will lecture on some of the plants exhibited. The exhibitions now close at four o'clock.

Medicinal Value of Apples.—Chemically, the apple is composed of vegetable fibre, albumen, sugar, gum, chlorophyll, malic acid, gallic acid, lime, and much water. Furthermore, the apple contains a liberal percentage of phosphorus, but it is less than in the pear, cherry, or plum. This phosphorus, the *Family Doctor* observes, is admirably adapted for renewing the essential nervous matter, lethicin, of the brain and spinal cord. It is, perhaps, for the same reason, rudely understood, that old Scandinavian traditions represent the apple as the food of the gods, who, when they felt themselves to be growing feeble and infirm, resorted to this fruit for renewing their powers of mind and body. Also, the acids of the apple are of great use for men of sedentary habits, whose livers are sluggish in action, these acids serving to eliminate from the body noxious matters which, if retained, would make the brain heavy and dull, or bring about jaundice or skin eruptions and other allied troubles. Some such experience must have led to our custom of taking apple sauce with roast pork, rich goose, and like dishes. The malic acid of ripe apples, either raw or cooked, will neutralise any excess of chalky matter engendered by eating too much meat. It is also the fact that such fresh fruit as the apple, the pear, and the plum, when taken ripe and without sugar, diminish acidity in the stomach, rather than provoke it. Their vegetable salts and juices are converted into alkaline carbonates, which tend to counteract acidity. A ripe, raw apple is one of the easiest vegetable substances for the stomach to deal with, the whole process of its digestion being completed in eighty-five minutes. Gerard found that the "pulpe of roasted apples mixed in a wine quart of faire water, and labored together until it comes to be as apples and ale—which we call lambeswool—never faileth in certain diseases of the raines, which myself hath often proved, and gained thereby both crownes and credit." "The paring of an apple, cut somewhat thick, and the inside whereof is laid to hot, burning, or running eyes at night, when the party goes to bed, and is tied or bound to the same, doth help the trouble very speedily and contrary to expectation—an excellent secret."

Food Value of the Coco-nut.—With respect to its life-supporting qualities, an Indian contemporary states that the coco-nut is quite equal to the best of other vegetable products that have been ranked above it, and although these nutritive qualities are admitted, the amount of nutrition derived is much greater than is generally supposed. As an example, we may refer to the account that has been published of a vessel which left San Francisco with four hundred passengers for Sydney. Running short of stores, they were obliged to put in at a port where a large quantity of coco-nuts was obtained. The remainder of the passage was attended with heavy weather, and the vessel became water-logged, only reaching Sydney after a perilous voyage of eighty days. Owing to the extreme length of the voyage, their provisions ran out, and men, women, and children were reduced to an exclusive diet of coco-nut, and, owing to the scarcity of these, the quantity apportioned was in the proportion of one coco-nut to each adult. Notwithstanding this diet, wholly unrelieved by any change, not a life was lost, not a single case of illness occurred, all the passengers landing in a healthy and well-nourished condition. This is speaking well for the trade in shredded coco-nut, which, with the improvement in manufacturing the last few years, has almost entirely replaced the fresh coco-nut. This is because of its keeping qualities, and when prepared in a careful manner it is much healthier, and certainly more economical, for it will not turn rancid.

Dahlias as Garden Plants are of such immense value that the paper on the subject to be read by Mr. T. W. Girdlestone, at the conversazione of the Horticultural Club on Tuesday, should be of much interest and evoke a brisk and instructive discussion.

Fruit Trees on Grass Land.—In a letter received from Mr. S. Pragnell, Broomfield Lodge Gardens, Chelmsford, he informs us that the apple crop was under the average, though better than in 1897. The point we wish to emphasize, however, is that at Broomfield almost all trees growing on cultivated ground have carried fair crops of good fruit, while the crops on fruit trees growing on grass land were almost an entire failure, the fruit dropping wholesale, and that remaining being very small; on these trees American blight has also been unusually prevalent. These remarks speak for themselves.

Sexuality of Fungi.—Considerable advance has been made during recent years in the discovery of sexual organs in several groups of fungi, and these discoveries are briefly set out by Mons. L. Mangin in the *Revue Générale des Sciences.* The close and patient researches of Messrs. Harper and Dangeard among Ascomycetes, of Sappin-Trouffy with Uredineæ, and of Thaxter on the Laboulbeniaceæ are especially referred to by Mons. L. Mangin.

Insect Infestation.—Cabbages recently planted for the purpose of giving supplies in late spring and early summer have the promise of giving good results should cold weather arrive in time to check insect activity, for which the season is maintaining its notoriety to the end. A considerable attack of Snowy Fly (*Aleyrodes proletella*), sometimes called the Cabbage Powdered-wing, is now in progress. It is a small four-winged fly, allied to the aphides and scale insects; when disturbed in its hiding-place on the under sides of the cabbage leaves it rises in hundreds and then falls like miniature snowflakes. Celery growers are having their share of trouble, for this plant, which should now be coming into profit, is much infested with the Celery Fly (*Tephritis onorpordinis*), a true two-winged fly, the larva or maggot of which, a leaf-miner, devours the substance between the upper and lower sides of the leaf, rendering the latter brown and shrivelled and incapable of making starch, so that the whole plant suffers from defective nutrition.

Temperature of Trees.—Herr F. Schlechert has been making some interesting observations in the sphere of vegetable physiology. He has discovered that the highest temperature in the stem of a tree, at about 4¾ inches (12 cm.) depth from the surface, occurs about midnight, and the lowest between noon and three p.m. While the chief factor which governs the temperature of the interior of a tree is the temperature of the surrounding air about twelve hours earlier, it is also affected by the temperature of the soil, by that of the ascending moisture, and by the degree to which the twigs are exposed to direct sunlight.

The Dock is regarded as an unmitigated nuisance both by farmers and gardeners, and not without justification, for when allowed to become established it is exceedingly difficult to eradicate. There is, however, a possibility of the weed giving a profit under cultivation, and the experiments in progress to put the matter to a practical test can hardly fail to be of interest. The Californian dock, known as "canaigre," is largely imported for the valuable tannic acid it contains. Specimens were sent to the Colonial College, Hollesley Bay, where, after several varieties had been tested, it was found that the roots were the source of the valuable glucoside. Twenty-one per cent. was the yield from the Suffolk dock, as compared with thirty-six per cent. from the Californian canaigre, and twelve to thirteen per cent. from oak-bark. As canaigre fetches from £10 to £20 per ton, and as an acre of land will yield ten tons, it will be readily seen that the English dock, which requires little labour in cultivation, may prove a source of revenue to the farmer, instead of the nuisance he has hitherto regarded it; but whether it will do so can only be determined by experiments conducted on a rather large scale.

Fruits of Diospyros Kaki have been perfected in the garden of Canon Ellacombe, on a tree growing against a south wall. The specimen has never been protected, and has been in its present position at least a dozen years.

Cold Storage of Hops.—The utilization of cold for the preservation of hops, though an innovation of very recent date, is securing rapid adoption. First attempted in the United States eight or nine years ago, the system was introduced into this country about three years ago. Our largest brewers are erecting, or have erected, cold stores of their own; hop merchants are providing stores for the requirements of their more moderate-sized customers; and there can be very little doubt that in a few years hence practically all the hops stored for, or stored by, wholesale brewers of any size or importance will be stored in the cold. Several authorities incline to the belief that the most valuable constituent of the hop is its soft resin; this resin undergoes in ordinary storage a process of deterioration which can be arrested or postponed by storing in the cold. In one largely-adopted method the temperature is kept below freezing point during summer and winter. It is not necessary that air should be excluded from the cold rooms in which the hops are stored, for any moisture which the air may introduce when the stores are opened for the purpose of withdrawing or depositing pockets is frozen, and thus rendered inoperative for mischief. The plan answers well, although it involves a considerable outlay in capital and working expenses. In a modification of this plan chloride of calcium is employed as an absorbent of moisture, and a temperature of 33 degrees to 40 degrees is then found to be sufficiently low for the preservation of hops. At the outset it was feared that, having regard to the dampness of our climate, hops withdrawn from cold storage would condense upon their surface sufficient moisture to damage them during the time elapsing between emergence from the store and arrival at the brewery, or during brief storage in the brewery just prior to use. It was further thought that they might have to go through some process of defrosting on their withdrawal to preserve them against this risk of injury. It has been found, however, that this risk is non-existent, and no process of defrosting is called for. The scientific study of hops continues to make steady progress. Amongst other recent investigations is that of the tannin of hops, and there are grounds for assuming that the quantity of hop-tannin may serve as a valuable index to the other important constituents. Methods are now in use for the estimation of the hard and soft resins in hop samples.

Commemoration Trees.—One reason why we should plant trees in commemoration of important events is, observes a daily contemporary, because we, at a nation, have ever loved memorial trees. They are found even in our simplest ballad literature, Since Tristan was buried beside Yseult, and out of one tomb grew a birch and out of the other a brier, the ballad-makers have given these memorial trees to a great many of the love-stricken lads and lassies who die, at the end of their verses. In many old English families it has been the custom for centuries to plant a tree in honour of some great event, and no one has followed it more enthusiastically than the Queen, who probably has planted more trees than any other Sovereign, unless it were Mary Queen of Scots. Unfortunately, in regard to the latter there is only tradition to go on, and probably it has added considerably to the box trees, hawthorns, and yews that she planted in various places of sojourn. Our own Queen has lived at a time when more exact records are kept, and the foresters of the future may be able to set at rest several controverted questions by watching the growth of such memorial trees as the fine oak she planted at Chatsworth in 1832, when on a visit with the Duchess of Kent, who planted a Spanish chestnut close by, while some years later Prince Albert added a sycamore to the group. It would be tedious to enumerate all the trees her Majesty has planted since at Windsor, Osborne, and Balmoral, to say nothing of those at Taymouth, Blair Athole, Drummond Castle, and elsewhere where she has adopted this means of commemoration. At Balmoral alone the Queen has but to look at ceatain trees to recall the stages of her career—one for the Prince Consort, one for her fiftieth birthday, one for the fortieth year of her Accession, one for Jubilee-day, 1887, ond one for her seventieth birthday, and so. The Prince of Wales, too, has planted a great number of memorial trees in his time, and could no doubt recall by their aid many great events of the last thirty years. From the records of private families innumerable examples of commemoration trees might be given; but none would be found more interesting than the long and magnificent avenue of Spanish chestnuts near Lord Egremont's ruined castle at Midhurst. The avenue was fomred to commemorate a visit of Queen Elizabeth, and for two centuries children have gathered chestnuts from the trees.

Failures in Hybridisation.—The Rev. Professor G. Henslow writes that he will be greatly obliged to any raisers of hybrids or varieties by crossing (not spontaneous seedlings) who will tell him of any species which failed to take the pollen of any other species, or of any variety of a species which could not be fertilised by crossing it with some other variety or species. He would like also to record any plants which could not be fertilised by their own pollen, or with pollen of other plants of the same species."

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

By the time these lines appear in print we shall be in the thick of the chrysanthemum season; in fact, we may have got a stage further and be nearly through it. Our editor, you see, has an autocratic way of putting general "copy" away in a drawer when shows and such-like things are prevalent. Of course, if he did but recognise the fact, the gardening public as a whole is far more deeply interested in the health and doings of Peter than in any number of shows. He is, so to say, a permanent exhibition of the most fascinating character. But things being as they are supposed to be rather than as they really are (this remark is more noteworthy for profundity than lucidity, I fear) I should not be very much surprised if we are temporarily shelved.

My remarks as to the N.C.S. imbroglio were parlously near to coming a day after the fair. When they were written the great question of show head-quarters was still unsettled, but before they appeared in type the fray was over. I am not very much surprised to see that the executive have overruled the sub-committee. There are some people who profess to be astonished, but I think they overlook one highly important fact, namely, that, although a large number of influential members are not at all satisfied with many details of the management of the society, they nevertheless perceive concrete advantages from the Aquarium association. It is not unlikely that the opposition is attempting too much, and would achieve a greater measure of success if it were more moderate. Personally, I remain of the opinion I have held a long time, namely, that it lacks a leader. With a really able tactician at its head it might do something, but it is disjointed and invertebrate. Tactics mean a lot in a world like this.

That there are troublous times in store for the society is not open to doubt. The present management perceive that clearly enough, and they give a striking proof of this in the much-debated three years clause. I regard this as one of the most adroit moves on their part, and if they succeed with it they will have scotched, if not killed, the opposition. Were Peter appointed to the front opposition bench he would fight that suggestion tooth and nail. I trust, however, that nothing will transpire which will in any way interfere with our present position of neutrality. I feel that the horticultural world expects from us the most carefully balanced and impartial opinions. What we think about the N.C.S. business is soon told. We are in entire sympathy with those who contend that the Aquarium is not an ideal place for holding flower shows, but we do not think that they have yet clearly proved that the disadvantages outweigh the advantages.

You all remember what happened with regard to the Drill Hall. No outcry that has yet been made about the Aquarium as a headquarters for the N.C.S. has equalled that which assailed the unfortunate Westminster rendezvous of the R.H.S. It was everything that was horrible, and even high officials of the Society joined in the condemnation. I have no wish to beat the big drum, but many of my faithful band of readers will remember that the only word on behalf of the Drill Hall was uttered in this column. I endeavoured to look at the matter, not from the point of view of a few horticultural specialists, but from that of the great London public. Time has proved which was the correct view, and nothing is now heard of the noisy criticisms which were so rife a few years ago. This paper, gentlemen, always takes the popular, rather than the class view, and it usually comes out right side up in consequence. Perhaps it gets a little abuse sometimes, and certainly it does not escape cheap sneers. But that sort of thing only serves as a tonic. The more we get, the better pleased we are.

I am sorry to have to drag in another reference to Peter, but he absolutely refuses to be silent on one particular matter. So firm is he, that it is quite clear that if I did not deal with the case he would write direct. If that happened, woe to the unhappy person who came under the lash. I am of a considerate disposition, and tone things down; Peter himself shows no mercy. The victim at present is "A. D.," and I need hardly say that the subject on which these two great minds are at variance is onions. Peter complains, and, I think, with some reason, that "A. D." has evaded his real argument in the most pusillanimous way. His position is that this idea of sowing Ailsa Craig and other large onions of what are known as the spring type, in autumn, is unpractical and absurd, because all the onions wanted for winter and spring use can be grown of the highest quality by sowing in the following spring.

Now, what is "A. D.'s" position? He would have us sow these sorts in the August of 1899 to use in the winter and spring of 1901. But we can get a splendid crop for use at that period by sowing several months later, that is, in the spring of 1900, and in the time intervening between our season of sowing and his we can get another crop off the ground. Will your correspondent please answer this objection? I can assure him that it is much too important a practical question to be passed over in silence. A reply to it is imperatively demanded, and I am a little surprised that "A. D." has not hastened forward before now with his answer. I can only hope that it is on the way, and if it anticipates this so much the better. I may say that, in thus wording Peter's complaint for him, I do so in entire agreement with him.

A man with an hour on his hands can usually pass it pleasantly and instructively in a perusal of the R.H.S. Journal. In preference to dismissing it with a cursory run through, I generally save it up for a spell of leisure, and I have not often had cause to regret doing so. It is, perhaps, a little heavy and sombre in its style, and I think it would be even more interesting than it is if it had a pleasantly written causerie. But it is eminently practical and good. The trials are to my mind one of the strong features of it. They are in good hands, and they tell us what we want to know in a commendably terse form. I was certainly a little struck with the report of the raspberry trials. I read that the canes were not procured until the autumn of 1896, and yet here in 1898 we have a report of them. I hope nobody will say that the R.H.S. is a slow-going body after this. To get a raspberry trial all over inside two years is an achievement of no small significance. I suppose there will be a certain number of people going about with a smile after reading this report, but there always were superior people in the world.

I presume that the black currants were procured from a different source to the raspberries. Why do I presume this? Simply because the report shows that there is a difference between Baldwin's and the Black Champion, and Mr. Bunyard, who supplied the raspberries, makes no secret of his opinion that the two are really one. He ought to know; but then, so ought the R.H.S. Which is right? The difference pointed out in the Journal is in the leaves, those of Baldwin being described as of equal length and breadth; while those of Black Champion are stated to be longer than they are broad. I had a stock of Champion in a former garden of mine that gave far larger fruit than Baldwin's, though I must in fairness say that the bushes were younger.

Mr. Lees need be under no apprehension of a "wigging" from me. We are on very cordial terms. True the plants which he was good enough to send me have suffered somewhat from the drought, but they have made a very pleasant feature in the garden for all that, and as the able and genial giver has supplemented them with some admirable articles in these columns I am more than content. LUX.

YELLOW-FLESHED NECTARINES.

A few years ago there was by no means a great liking for yellow-fleshed nectarines, but their free cropping and other excellent qualities have made them greater favourites of late. The Messrs. Rivers and Son have given us some very fine varieties, which should find a place in all gardens where nectarines succeed, and these have helped to popularise the section. I do not intend to name every yellow variety, but to briefly note those we find best.

Pitmaston Orange is one of the oldest varieties, having been raised at Pitmaston, near Worcester, as long ago as 1815. This is a very beautiful fruit under glass; it is not equal, however, to Pineapple with us for open wall culture, as we find in some seasons it cracks badly, and does not ripen so well as varieties of recent introduction. Another point against it is that it makes less growth than Pineapple and Humboldt, so that unless the situation and locality are of the best I would certainly advise planting stronger growers. On the other hand, forced, or grown merely with glass protection, Pitmaston Orange is one of the most delicious of nectarines, as the flesh is rich and the fruits colour grandly. Rivers' Orange is, with us, more reliable on open walls than the former. It is a seedling from Pitmaston, and is very much like it but earlier, and in many places precocity counts for a good deal; it is very prolific and an excellent nectarine for open wall culture. The fruits are of a beautiful colour, and the quality even superior to that of the parent, the flesh being very sweet and juicy. Fruits are produced so freely that with us this variety needs severe thinning. My favourite yellow-fleshed nectarines are Humboldt and Pineapple for open wall culture. Of course, with white-fleshed varieties the newer Early Rivers and Lord Napier cannot be beaten. Humboldt is a very beautiful fruit, a delicious nectarine of large size. This was raised from Pineapple, and if only one kind can be grown Humboldt should have the preference. This is one of the Messrs. Rivers' seedlings, and one of the best nectarines grown, richly coloured, having the delicious flavour of Pineapple, and being very prolific, succeeding where others fail. I have found this variety equally as good on a west as on a south wall, but of course later. Its season is the end of August, but there is no difficulty in keeping the fruits longer. This variety makes a free growth; we have trees that have only been planted three years and they are already of large size.

Pineapple is a much later variety, and is another seedling from Pitmaston Orange; it produces beautiful fruits on a warm wall, is a medium grower, and fair cropper; also, with us, it is far more reliable than its parent, and is valuable for its lateness, as it ripens during the early part of September. The fruits are large and of rich flavour, flesh a deep orange colour, and skin a beautiful dark red on the sunny side. It is one of the hardiest of nectarines, and often seen at exhibitions in the latter part of September; this season, on a south wall, and in spite of the hot summer, we gathered our last fruits of this variety on September 27.

Darwin, also one of the Rivers' seedlings, is probably less known than some newer varieties of the yellow-fleshed section; one of its parents was no doubt Stanwick. With us it is less reliable on the open wall than the others already noted, but the quality is so good that it deserves a place in the section. Darwin is an early variety, quite a week ahead of Rivers' Orange; the fruits are handsome, roundish, and the flesh a bright orange colour. It is an excellent variety for the cool house, and forces well, but for open walls I prefer the larger fruiters. Byron, a late large nectarine, is of excellent quality, and a free-grower, if given good culture; it is not unlike Pineapple in size and appearance, but both should be grown; the quality is good, and the fruit keeps well, it being in season about the same time as Pineapple. There are other varieties, but it is not necessary to name them, as the foregoing are our best.

Syon Gardens. G. WYTHES.

LEAVES FROM A RAMBLER'S NOTE-BOOK.

INTERESTING CORNERS.

ALMOST every garden has its quiet nooks and interesting corners, to which it is a relief sometimes to escape from everything flavouring of rule and practice, and seek solace in Nature as she is found there, with perhaps an addition of history and romance. There are doubtless those who have an eye for nothing but the practical work-a-day side of gardening—the sowing, planting, potting, pruning, and all the rest of it—and such of course find no pleasure in the interesting corners that delight others cast in a different mould. The same may be said of gardening literature. We have so much that is doubtless sound, practical, and good, that to read assiduously is keeping abreast of the times, but by the time one has gone carefully through a long practical essay, and reached the end, there is a demand for variety and change which is found in the interesting corners of literature; for, though only a limited number of writers have found it out, there are many phases of the garden, not necessarily practical, which have rarely or never been touched upon, whilst everyday matters have been worn threadbare. 'Tis good sometimes to break away from rule and seek variety, hence no apology is offered for leaving that which, though all-important, becomes a little tedious, and dwelling briefly on a few impressions gathered in the nooks and corners of the garden.

I have said that nearly every garden possesses its interesting corners, and the more ancient the garden the more interesting the nooks. Rarely are these points shown when paying a visit. 'Tis the gardener's office to show you the garden, and in the good man's idea these are only bits thrown in. He cheerfully leads the way through the greenhouses, the vegetable, fruit, and other departments, naturally thinking these are all you have come to see, but you find the interesting corners yourself in passing from one point to another. What greater relief could one have, when getting a little wearied with the stereotyped, than to find oneself, without hardly being aware of it, in a half-hidden, half-wild bit of garden approached by a narrow winding path that appears to have chosen its own meandering route, in order to make the surprise greater when you reach the end? Such a spot gives you the most comforting impression of a garden—rest. There may be nothing special there, nothing to interest the expert or the sternly practical gardener, but there is an air of repose, a semi-wild luxuriance of vegetation, a kind of miniature garden all its own that cannot fail to appeal to one. Yet there may be more. There is interest even in the ivy creeping over the tree stumps, or the blue periwinkles peeping out from among the bushes. There may be greater interest in such a spot, but you must penetrate to find it. It is cool and shady, and the semi-natural, semi-artificial attempt at rockery is not there with any idea of approaching the artistic, but rather to form a home for the little alpine and rock plants that peep out from the recesses. Many gardens possess such a corner, but minus the alpines, and a charming addition is lost. It would serve no purpose to mention names, as the family is so large, but they adapt themselves perfectly to sheltered corners, and in such spots their simple beauty may be appreciated to the fullest. Neither is animate nature wanting. Song-birds build fearlessly in the bushes, and on spring days it is the resort of the cuckoo, and when shadows fall the nightingale takes up the thread. Who will say that such a corner is not crowded with interest?

In a well-known garden I could mention one of the prettiest and most interesting bits is rarely seen from the most advantageous point; in the first place, because few know where that point is, and, secondly, because it is difficult of access. In this interesting corner there is water, and doubtless at one time there was an intention to make it a feature in the shape of an elaborate cascade. For some reason or other the idea was evidently abandoned, but not before something had been done, and the assistance that art at that time rendered to nature is now charmingly apparent. A cascade with only a driblet of water is but a poor apology, but here there is an abundance, which tumbles over the moss-covered stones and creeps through the masses of bogbean and yellow May blossoms till it loses itself in a diminutive marsh at the bottom. Most visitors peep at the dripping water from the top, where little can be seen for the overgrown bushes that crowd each side. To appreciate the wild beauty of this interesting corner one must carefully pick a way over the boggy ground now blue with forget-me-nots, and follow the slippery overgrown path by the side of the cascade from the base. A weeping willow droops half over the water at the bottom, and under its spreading branches is a rustic seat. The approach is by stepping-stones, now slimy and overgrown, and the very existence of the retreat seems quite forgotten. Scarlet hawthorn, white lilac, laburnum, and guelder roses in their season hang gracefully over the waterway, and pretty orchises peep out among other wild flowers near the water's edge. The shady banks and rocky nooks are the home of ferns. Here is an immense clump of the Royal Fern (Osmunda regalis), there the Lady fern (Athyrium filix-fœmina), and forms of lastreas, polypodiums, polystichums, and scolopendriums. Time was when all these were planted with care, and though that bit of garden has been apparently forgotten, and has a half-neglected look about it, vegetation has prospered, and the work of years ago is still apparent.

Some gardens possess a cemetery, and though a burial-ground is usually connected with sad thoughts and recalls painful partings, no such gloom hangs over the garden cemetery. It is an interesting spot, where rest the remains of some faithful horse or dog that for long service or extraordinary sagacity has been perpetuated to memory by a honoured grave. I know of such a corner in a garden where the last resting-place of a faithful charger is marked by a moss-covered stone, bearing the following inscription: "This gallant horse carried his master, Captain ——, in the battles of Salamanca, Vittoria, Nivelles, and Waterloo. He lived to a great age, and was buried here with appropriate honours." The date follows, but it has slipped my memory. Shades of the past! What more appropriate burial-place than a nook in the garden would one desire for a creature that played a part in overthrowing one of the mightiest dynasties the world has ever known? In the gardens at Tredegar Park, Monmouthshire, in a quiet, secluded spot, a stone column is reared over the remains of a horse that carried his master, the present Lord Tredegar, through the valley of death at Balaclava. He bore his rider safe through the ill-fated charge "and back from the jaws of death," and in doing so earned a lasting reputation and a monument. Ivy creeps now round the foot of the stone, and there is nothing in the surroundings to attract the attention of a gardener, yet the spot to any visitor is one of the most interesting in the grounds. These are but a couple of solitary instances in the many that, no doubt, exist where the bones of faithful animals are given a honoured resting-place in the garden.

There is always a charm about a bit of crumbling ruin in a garden, though it is, of course, quite distinct from anything connected with cultivation. The crumbling masonry, held together only by the tendrils of ivy, tells an unwritten story of the past. All decoration may be gone from the embrasured windows where now flourish flowers and weeds that owe their existence to the birds that deposited the seeds there. At night the screech owl hoots round the ruined battlements, and late-roosting birds hustle into the ivy at the warning of danger. A few stunted old roses grow outside the walls. They may be ancient, or they may be modern, but there is no record of them, and you like to think that they or their parents were prized in the garden when the ruin was the home of some vassalled lord of the manor. All ruins are cherished, and particularly so in a garden. I have yet to meet the man possessing one of these bits of antiquity who did not cherish the fragments of crumbling masonry with a jealous pride, and guard them with as great care as any of the modern portion of his establishment. History repeats itself. Once the pile was fortified and protected against the onslaughts of enemies. Now there is nothing left but a few bits of decaying ruin, but as jealously protected as of yore, though now the enemy is Time. The old pile is surrounded by legend and story which no one thinks of questioning or contradicting, and every nook and crevice in the tottering fragment seems to be filled with a little history of its own. Moss covers the pavements on which barons once trod, old-fashioned flowers flourish where armed men fought. Nothing original would be in keeping there, and though old and tottering, half wild, and apparently uncared for, the ruin will be, as long as it stands, one of the most interesting corners in the garden.

H.

AUTUMN COLOURS.

THERE are many trees and shrubs in the pleasure grounds which present the most artistic colouring every autumn, and some of these are of exceptional beauty this year, owing, no doubt, to the very bright and late sunny season. First and foremost in point of beauty was the tulip tree, Liriodendron tulipifera. This tree was most charming with its intensely golden leaves, and could be seen from a long distance; this season it carries a lot of seed pods, which I am anxious to see ripen. This tree, when well grown, is very handsome, especially when clothed to the ground; it is easily grown, and as a deciduous tree has few equals for lawn and park ornamentation, as it will grow in nearly any soil. Koelreuteria paniculata is another tree that is unusually beautiful this season, its leafage being of a very bright and striking yellow, very similar to the colour of its flowers. Leycesteria formosa was also very striking, and is well worthy of a situation in the shrubbery, especially where a taller tree grows above it; this shrub will grow in partial shade and in cool ground, and, in fact, hardly any place could be found where it will not thrive. It is an erect grower, with long pendulous racemes of white and purple flowers.

Amelanchier canadensis is a small tree, remarkable for its perfect autumn colouring of golden yellow tinged with red. Cotoneaster Simmondsi is one mass of red berries, these making a beautiful contrast to the rich hues of the decaying foliage; C. frigida is likewise one mass of berries, and one of the most handsome features of the shrubbery; C. nummularia, with its dark purple berries, is also very attractive. These cotoneasters are easily raised from seed, and soon become nice specimens in nearly any soil from sand to clay. Cratægus Crus-Galli, or Cockspur Thorn, is very beautiful, both foliage and berries being extremely well coloured, and more persistent than usual. Rhus cotinus, now that the flowers are all gone, has its foliage exposed, and is a picture of beauty, the leaves being mottled red and yellow; the latter are extremely useful and pretty for dinner table decoration. The specimens of the Pampas grass are excellent this season; the mild winter of '97 and '98 and recent favourable summer and autumn seem to have suited them well, especially those upon the northern slopes; the light green foliage and silvery plumes add to the fine autumnal effects in our gardens.

Compton Basset. W. A. COOK.

Baumann's Red Winter Reinette Apple.—I could but notice how very much out of place this large apple looked in a class to itself amongst the single dishes of dessert varieties at the Crystal Palace show. The fruits were well fitted to be in the cooking section, being quite large, and whilst not at all in harmony with the required pippins, pearmains, and nonpareils of the dessert section, would have been absurdly large to place on a dinner table, except when cooked. Not only are big fruits quite out of place in the dessert, but there should be, irrespective of other qualities, a specified average size for dessert fruits, and almost every other variety, classed as such, is of moderate size. Blenheim Pippin is the largest, perhaps, but no one in preparing a dessert thinks of putting up the largest, but rather the best smaller ones.—A. D.

PLANT ROOTS AND PLANT FOOD.

IN the interesting controversy going on in the GARDENERS' MAGAZINE between our esteemed friends "Lux" and Mr. J. Riddell, "Lux" states that "roots do not create food, but food creates roots," while Mr. Riddell maintains the reverse order "that roots create food, but food does not create roots." My own opinion is that both are right and both are wrong.

In the first instance, food creates roots, because if there was no food in the seed sown there would be no growth of roots. But roots having once been established, go on accumulating plant food from the stores within the soil or from the atmosphere. If we took a quantity of rocks, such as we find in various parts of the earth's surface—granite, slate, quartz, limestone, &c.—and after grinding them to different degrees of fineness, were to mix them together in different proportions, we could from the known composition of these various rocks produce soils which would contain the most important mineral constituents of plant food in very different proportions. Assuming that we purposely made one soil as rich as we could in this mineral food, one as poor as we could, with two others in intermediate stages, and we left them exposed to the ordinary influences of sun and rain—provided the area was sufficiently large—we should find that the seeds of plants carried by the winds and other agencies would spread and grow upon these soils with very different degrees of rapidity. The character and amount of the vegetation would differ greatly on the different soils, and the largest amount would be found on the soil where the plant could obtain the largest amount of mineral food.

There being no carbon or combined nitrogen in the soil, the first plants would be entirely dependent upon the food in the seed and what they could obtain of these substances, directly or indirectly from the atmosphere. Rain water always contains ammonia, and the plant and the soil may condense a certain further amount from the atmosphere; but growth, even in the soil richest in mineral food, would at first be small, as the decomposition of carbonic acid and fixation of carbon would be limited by the amount of combined nitrogen which the plant could obtain from the sources mentioned; and it would be much greater where the most abundant mineral food existed, as every particle of the available nitrogen would be there used up; while where there was less mineral food some of the combined nitrogen might pass through the soil and be lost.

Every year a certain portion of the vegetable growth dies off; leaves and branches fall, and portions of the roots decay. Part of the organic matter which falls upon the surface of the ground returns again to the atmosphere, but a certain part remains, and, added to that which decays underground, becomes available for future growth. The atmosphere of the soil, which at first differed little from that which exists above it, becomes highly charged with carbonic acid, which decomposes the minerals of the soil, and thus year by year more and more of the nitrogen collected by each generation of plants becomes available for the generation that succeeds it.

The nitrogenous capital of a soil, which represents to a considerable extent its fertility, thus depends, as a rule, on the bulk of the previous crop residues. The present fertility of a soil is, therefore, in great measure a consequence of its past root growth. The organic matter in a fertile soil, say in a pasture turf, derived chiefly from root growth, is continually undergoing oxidation by various agents in the soil, the general result being its conversion into the simple substances, water, carbonic acid, and nitric acid. The vegetable root residues left by previous crops are thus reconverted into plant food, and made fit to support the life of a new generation of plants. It is consequently true that when rootlets come in contact with soil in which there is an abundance of plant food they will be developed with far greater rapidity than in neighbouring portions of earth in which less food is to be found.

To test this point Nobbe took some heavy clay, and divided it into two equal portions. One of these was left without manure, to the other was added a full supply of manure. Red clover was planted in each, with the following results:—

	Weight of Hay. Grains.	Weight of Roots. Grains.
Unmanured	431	30
Fully manured	592	60

The two boxes of the experiment were found to be filled throughout with vigorous roots, though, naturally enough, the roots were more abundant in the fertilised earth, and weighed twice as much as the roots in the unmanured soil. Further, it may be mentioned that Professor Corenwinder planted a number of beets in a circle two feet in diameter, and pushed down a bit of oilcake an inch or so into the soil at the centre of the circle. Some months afterwards he found that several of the beets had sent out horizontal rootlets as far as the oilcake, which was covered with a complete mat of capillary rootlets. One or two of these side rootlets had passed through a course of sixteen inches before reaching the oilcake.

Professor M. C. Potter, M.A., in his work on "Agricultural Botany," says, "The root in many cases forms an excellent repository for the various reserve materials which are manufactured by plants for use on a future occasion. This is especially the case among herbaceous biennial or perennial plants, which live in countries where either warm and cold, or else wet and dry, seasons alternate with each other, and whose stems die down during the period unfavourable to growth.

In these plants the leaves manufacture during the period advantageous to plant life more material than is required for immediate use. This excess of material is in many instances stored up in the roots, and forms the reserve fund from which stem and leaves are constructed in the next spring.

To sum up the matter in a few words: (1) Plant roots will not grow in sterilised soil unless food be added from external sources; (2) Roots having once established themselves in a soil increase the store of available plant food by their excretions, their root sap, and even in their death by decay and the nitrification of their products.

Harpenden.

J. J. WILLIS.

THE BRITISH BLECHNUMS.

I HAVE headed this article in the plural, despite the fact that there is only one British species, because the varieties of that species are so marked in character that, if found abroad, some of them would certainly be regarded as specific forms. Considering the tough texture and evergreen nature of the fronds, and the pretty contrast afforded by their two-fold form, it is much to be regretted the species is not more frequently seen under culture, that is, in moist, shady nooks and corners, where drought, its greatest enemy, cannot penetrate. The fronds, as I have said, are of two forms, one set, the barren ones, being shaped like a double, broadly toothed comb, the teeth of which are blunt, and set closely together on the midrib, and tapering in length towards both ends in the shape of long slender lances. These barren fronds spread out into a circle, and are sometimes considerably over a foot in length. Their colour is a dark and shining green, and texture so hard and tough that the popular name of the Hard Fern is fully justified. The fertile fronds, on the other hand, grow perfectly erect, are longer than the barren ones, and much more slender, the comb teeth being reduced to almost midrib. This difference persists through all varieties save one, called Blechnum spicant anomalum, in which all the fronds are slightly fertile and narrowed. The fructification is very peculiar, apart from its confinement to a special set of fronds. On examination it is seen that the spore heaps extend the entire length of the pinnæ, or comblike teeth, in two lines, one on each side of the midrib, and that a thin, skinlike cover springs from each side of each line, so that the spore cases or pods lie in a deep furrow. This independent cover or indusium distinguishes Blechnum from its near relative Lomaria, in which the edges of the comblike teeth are turned over to form the cover, while in Blechnum they are placed as an independent margin all round. This being so, it is curious that some of our most popular authorities call our native species Lomaria, ignoring altogether the clear specific character which has determined the separation of the families.

Blechnum spicant is a very widely spread fern in the British Isles, and frequents hedgebanks, moorlands, glens, and forests, and indeed may be found everywhere where plenty of moisture and leaf-mould and an absence of lime (its special aversion) and the peripatetic fern vandal (its particular foe) give it a fair chance of existence. Under culture it does well in many soils, if they be free from lime, and soft water alone be supplied. A fine yellow friable loam, with a liberal admixture of leaf-mould or peat, and some silver sand to keep it open, suits the fern well, and once so installed it will thrive for many years without a shift. Its habit is to spread by short stolens or offsets, so that in time a clump is formed, and when well established there are few decorative plants to surpass a good cleanly grown Blechnum spicant, with a crop of decumbent barren fronds spreading round in a large rosette, and a dozen or so tall spikes of the fertile ones to set them off by contrast.

The species, as I have said, has been by no means chary in affording good sports or varieties, some beautifully tasselled, some branched as well, some beautifully cut, the combteeth being combs themselves; and others contracted, congested, or varied in other ways. In every case, with the one exception above cited, these peculiarities present themselves associated with the two forms of fronds, and are often so exaggerated in the fertile ones, owing to the contraction. As usual, nearly all the varieties have been found wild, though we owe the most beautiful of all, known as Airey's plumosum, to a sowing from a merely saw-toothed find, B. s. serratum. This, if well grown, is one of the grandest British ferns we have, displaying wide, triply-cut fronds two feet long in profusion. A plant I exhibited some years ago at the R.H.S. Fern Conference was so beautiful that competent judges could hardly be persuaded it was of so normally simple a species. One of my own finds, B. s. concinnum Druery, is a small grower, but has the comb transformed into an even string of tiny green scallop shells, the fronds being ribbon shaped, and only a quarter of an inch wide. Mr. Barnes found one, B. s. lineare, in which the fronds are scarcely divided at all, being narrow and strap-shaped; while another find of his has sharply-pointed, slender teeth, and a radiating, spiky crest at the frond tip—B. s. multifurcatum Barnes (or B. s. trinervis coronans).

Mr. Phillips, of Belfast, found a curious form, in which the two bottom teeth of each frond are transformed into smaller fronds, making a sort of trident. This variety covers a large area in the Mourne Mountains. Dr. Kinahan's Irish find of B. s. ramocristatum is finely branched and tasselled, and several finely tasselled varieties have been found by Mr. G. B. Wollaston and others. I have two very good varieties of this crested character, one found by a quarryman (Sinclair) in Strathblane, and another by a lady friend in Devonshire, both thoroughbreds. B. s. Aithinianum and B. s. cladophorum are curiously branched varieties, but do not rank among the gems. There have also been finds of densely leafy character. B. s. imbricatum is one, Hartley's crispissimum another—a veritable dwarf, even the hard little fertile fronds not exceeding some three inches in height, springing from a rosette of the same diameter.

All those named are well worthy of culture, and, if my remarks be attended to as regards the aversions and needs of the plants, their beauty will well repay the little care required. B. spicant is as green in the winter as any other time, and that is an advantage: it needs no heat, and, given only congenial harbourage, will always pay its rent.

CHARLES T. DRUERY, F.L.S., V.M.H.

A Flower Farm is described in a contemporary as "a delightful sight in summer, where breadths of one to ten acres of brilliant colours make an effective mark in the landscape," and "where the eye is irresistibly drawn to a fiery mass of orange scarlet . . . so bright that workmen can only spend an hour or two at a time for weeding, the intensity of the colour affecting the eye." We should hardly consider a "sight" of this description delightful, but there is no accounting for taste.

CHRYSANTHEMUMS AT THE NURSERIES.

Messrs. J. Veitch and Sons.

Compared with some of the trade collections, the Chelsea collection of this well-known firm is not exceptionally large, but it certainly is of a very high order of merit, both from a cultural point of view and in the selection of varieties grown. There are two large greenhouses in which the collection is arranged, and in one of these there are some very pretty and useful bush-grown plants suitable for general decorative purposes. The varieties employed in this way consist principally of Madame la Comtesse Foucher de Careil, Lady Fitzwygram, M. W. Holmes. W. Seward, Souvenir de Petite Amie, W. Tricker, and Mrs. Cullingford, with several examples of others less well known, such as the old Mdlle. B. Pigny, which is very free, Mabel Douglas, deep yellow, and October, yellow.

Passing through the house containing the main collection, Descartes, the richly-coloured Japanese anemone, is much in evidence; Frank Ashman, a large Japanese with very broad florets, deep golden yellow; Colonel W. B. Smith, Mrs. R. C. Kingston, incurved, large and good, and the curious pale yellow sport from Enfant des deux Mondes, called Leocadie Gentils, are sure to attract the visitor's attention. Mrs. Falconer Jameson is rich in colour, and so too is John Neville, a Japanese, with very long drooping florets twisted at the tips and of medium width, colour deep golden yellow, shaded carmine.

James Murray belongs to the old type of florists' incurved, and is of good form, the colour pale pink. Miss Nellie Pockett is of Australian origin; it is a very pretty Japanese, with a multitude of very narrow grooved incurving florets pointed at the tips, colour pure white. William Towers is a large spreading flower, with long drooping florets of medium width, and the colour is very pure pale canary yellow. The large, white Lady Byron is in good form, deep and solid, so too are Sunflower and Robert Powell, both fairly well known. Modesto, the rich, deep golden-yellow American introduction, is very fine in colour and size.

Amongst the miscellaneous novelties of a few seasons ago received from the Continent, M. Aug. Lacoivier is rather early, but of a peculiarly delicate blending of colour. Baron Hirsch, Hairy Wonder, and William Seward are also noteworthy. Good whites are represented by Mrs. H. Weeks, Mrs. Chas. Blick, Mutual Friend, while higher tones and varying in degrees of richness are Octoroon. Royal Standard, Ethel Addison, Charles Davis, and its parent, Viviand Morel.

Calvat's seedlings are finely-flowered, one of the best being Louise, which is big, massive, and of good substance. President Nonin is very large, an incurving Japanese of fine form, buff yellow with a straw reverse. The rich golden-yellow Amiral Avellan is also of good size, and, like most from this source, helps to maintain the reputation of this well-known raiser. Werther, a deep rich velvety-purple amaranth, is fairly well known, as also is M. C. Molin. General Paquié is another very large Japanese of a deep orange-yellow shaded bronze, and having very long florets. President Borel, Madame Gustave Henry, need no description. One of the older sorts is Madame Marius Ricord, a very pleasing shade of deep rosy-pink, and Madame Ferlat, a finely incurved white variety of large size, leaves little or nothing to be desired. N.C.S. Jubilee, pale silvery-pink, and Souvenir de Molines, orange-bronze, are also worthy examples of M. Calvat's skill.

At Earlswood.

Mr. W. Wells just now has a very attractive and extensive collection, comprising nearly all the best introductions from all sources, but particularly in French and colonial novelties. The plants are arranged in a large span-roof house of dimensions suitable for making an imposing display, and knowing from past experience the quality we might expect we were pleased to find our estimate not disappointing. The incurved section is not so largely represented here, but there are still a few of undoubted merit, and of these Topaze Orientale, a lovely pale pure yellow, with a multitude of narrow florets forming a deeply built compact flower, is certainly one of the best. Madame Desblanc, incurved Japanese, is of a charming shade of pale mauve passing to white, and Yvonne Desblanc is a very perfect large white incurved of good form. Emile Nonin, seen last season, golden chestnut, is also promising.

In the Japanese section almost every type and form are represented, the preference, however, being given to promising varieties suitable for the showboard, of which Mrs. White Popham is a very large deeply built Japanese flower with medium-sized florets pointed at the lips, colour pale purple mauve and a silvery reverse. This is grown in large quantities, and makes a noble, imposing looking bloom. A fine deep golden chestnut tone is found in John Pockett, an incurving Japanese of colonial origin, having rather broad florets and a reverse of golden bronze; Pride of Madford, from the same source, also appears to maintain its previous reputation, while the rich crimson sport from that variety, Pride of Stokell, having a golden reverse streaked crimson, will be sure to be effectively employed where brilliancy of colour is required. Also of colonial origin are Australian Belle, a deep rosy pink, and a large white called Mrs. C. Boun. Chatsworth is another, but the finest of all is undoubtedly Mr. T. Carrington, a Japanese incurved with very deeply grooved florets, grooved and pointed, and of great length, the colour being deep velvety purple, with a reverse of pale silvery purple.

Still confining our remarks to Australian seedlings, in which the Earlswood collection is peculiarly rich, Miss Nellie Pockett, a fine white Japanese, has been seen in good form at several places; and The Convention, Japanese incurved, deep golden terra cotta, shaded bronze inside, is of a very taking shade. Mrs. G. A. Harris, golden bronze, is striking but rather small; and certainly one of the finest, which we believe it is intended to call Lord Ludlow, has a multitude of narrow-grooved florets of great length, is very deep and globular in build, and in colour is of a very rich shade of fine canary yellow, shaded in some instances with bronze. Nor must we omit Australie, big, massive, and tall as usual. Purple Emperor is also colonial, and a lovely, telling variety it is, the colour being indicated by its name. Whites are strongly represented by Western King, Beauté Grenobloise, Mutual Friend, Don de la Madone, Madame Carrey, Madame Ph. Rivoire, all of varying shades and forms; also others like Simplicity, Madame Carnot, and Mrs. J. Lewis. Then there are some very good blooms of G. J. Warren, the yellow Carnot sport, and the pale sulphur Mrs. W. Mease, which claims the same parentage. Lady Hanham, the Viviand Morel sport, and Mrs. J. W. Barks, a fine deep golden-bronze sport from Edith Tabor, are both worthy descendants from popular favourites. Mary Molyneux, pale silvery pink, large and promising, was seen last season in very grand style. W. Towers, medium sized narrow florets, a Japanese of pale canary yellow; Ella Curtis, a deep golden yellow; and Mrs. Hunter Little, with long narrow florets but rather thin, are certainly not the least attractive. Mrs. G. W. Palmer is a rich purple bronze, and M. Louis Remy, a pure white, both sports from Mrs. C. Harman Payne, and equal in size. Joseph Chamberlain is deep chestnut crimson, reverse golden, very compact, and of the incurved Japanese type.

There is a good number of French novelties from various raisers more or less well known, and whose flowers, taken on the whole, are only of ordinary merit. The exhibitor who grows for big prizes will, however, be more interested in Calvat's seedlings. Madame G. Bruant, introduced last season, is richer in colour than we have seen it elsewhere, for instead of being almost white it is of a fine shade of pale purple mauve paling off to white in the centre. N.C.S. Jubilee, delicate silvery pink, is good. Surpasse Amiral is a large deep golden yellow. Dr. Liébert is another large one, having narrow florets curly at the tips, pale pinkish mauve. Iserette is also good in colour. M. Hoste, Pres. Nonin, Werther, Madame Gustave Henry, Congrès de Bourges, Madame Ferlat, Australian Gold, the very curious green Madame Ed. Roger, Mdlle. Lawrence Lédé, and Madame X Rey Souvin, all recent introductions, have already been seen in more or less good form last season or before. But dealing exclusively with his novelties for the present year which have not been seen in flower in this country before, the most meritorious in his set are undoubtedly Pres. Bevan, a fine large solid Japanese incurved with broad florets, colour deep golden buff; Mdlle. Madeleine Expulson, a deeply-built bloom, with florets sharply pointed, twisted, and intermingling, colour pure creamy white; Marie Calvat, a very large but rather rough Japanese with long straggly tubular florets, white tinted purple; M. Fatzer, Japanese incurved, with medium florets, deep golden yellow outer florets, tinted bronze; Madame Couvat de Terrail, large, but flat, a Japanese, colour white, and General Paquié, a fine Japanese, with flat drooping florets, colour deep golden amber, with golden reverse, and of which a coloured illustration was given in Mr. Calvat's spring catalogue. Madame Bertet, white; Mélusine, rosy white; Mdlle. Gab. Seince, white, also belong to this season's set, but are not so striking and effective as those already named.

We cannot leave this eminent grower's novelties without referring to Le Grand Dragon, a fine long-petalled golden yellow Jap; Tatiana, a very close, compact Japanese with long drooping florets, a finely-formed flower, colour rich canary yellow; and Perle, fine, a large Japanese with long quilled florets, a pleasing but curious flower, colour deep lilac pink. There are in all thirty-two of Mr. Calvat's 1898 novelties, but we think we have selected from them the names of the best and those most likely to suit the exigencies of English exhibitors, to whom Mr. Calvat appeals far more than most of his fellow countrymen.

At Swanley.

The large span-roof house in which Messrs. Cannell and Sons' collection of chrysanthemums is usually staged is very bright just now, and contains a comprehensive collection of novelties from all sources. The blooms, as a rule, are well developed, and will repay a visit to anyone interested in the study of the season's novelties. Continental novelties are very numerous, and, as a whole, promising, although here and there we find examples of seedlings from one or two well-known raisers that appear, to our taste, to be disappointing. There are several contributions from MM. Delaux, Nonin and Boncharlat, one or two of the last-named being of a very delicate and refined character, although not quite up to our exhibition size.

Calvat's novelties of the past and present seasons comprise, amongst other grand things, M. Fatzer, a very large, deeply-built Japanese incurved, close, compact and solid, colour rich golden yellow. Topaze Orientale is a lovely pale yellow incurved of fine form, deep and regular in form. Mdlle. M. Expulson, a large white, Souvenir de Molines, large, bright brick-red, tinted and tipped with gold. In very rich shades of colour Madame Robt. de Massy is of a deep velvety purple, with silvery reverse, a Japanese, large and deep in form. Le Grand Dragon, fine Japanese, of deep golden yellow, has already been mentioned in the N.C.S. Floral Committee report; Mélusine, very long, drooping florets; white, shaded purple, is big and deep. Sardou is not large for an incurving Japanese; it has grooved florets of a reddish shade inside, with reverse of gold. A fine yellow is to be found in Tatiana, which has long, drooping, narrow florets, and is of a beautiful shade of golden canary yellow. This promises to be quite an acquisition. Iserette, golden bronze; President Nonin, Australian Gold, Beauté Grenobloise, white; Congrès de Bourges, Madame Ferlat, N.C.S. Jubilee, a fine pale-silvery pink; M. Massange de Louvrex, yellow, and the peculiar green Madame Ed. Roger are all a season older than the preceding, but by no means the worse on that score. General Paquié is a very fine new yellow Japanese, and from the same set comes Marie Calvat, a big, white Japanese, slightly tinted. There are many other varieties from this source, but we have said enough to give an indication of their merits, and there is no doubt that M. Calvat still occupies the foremost place, in spite of several strong competitors from his side of the Straits of Dover.

In Continental incurves of recent date Triomphe d'Eve is a fine white. Emile Nonin, deep golden chestnut, is good, but not equal in form to the first-named. Yvonne Desblanc, pure white, and very large, is also a first-class novelty of this type.

While holding a high opinion of the Continental novelties, we are by no means unmindful of the special claims of our kindred across the sea in far Australasia, and this is the first year we have had such a capital opportunity of seeing so many colonial novelties at once. We like Mrs. J. T. Tibbs, a pure white sport of Lilian B. Bird, and also Mrs. H. B. Higgins, a fine large white Japanese of a pure creamy shade, very delicate and soft in tone. Mr. T. Carrington is a fit companion for such monsters as Australie and Pride of Madford, to both of which there is a slight likeness. Miss Mary Underhay is a Japanese incurved of very good build. The florets are of medium size, regularly incurving, grooved and ribbed on the reverse, a lovely thing in colour, being a rich buttery yellow. Purple Emperor, as its name implies, is grand, velvety purple and silvery pink reverse. Wonderful of the Wheeler type, Euterpe, rosy mauve; Nellie Pockett, white; Mrs. Bissett, S. Kerslake, pure white; and Miss Vera May Fraser, lovely shade of terra cotta, exhaust the space at our command for this group.

Among home-raised Japanese of varying shades of yellow, Edith Tabor, Ella Curtis, Baron Tait, C. T. Payne, and the fine Carnot sport, Mrs. W. Mease, must not be forgotten. Lady Hanham, the beautiful Viviand Morel sport, is also first rate, and in whites we get Mrs. H. Weeks, Lady Byron, Kathleen Rogers, a fine Japanese incurved of good size and substance. Belle Mauve is pretty in its class, a Japanese with long florets the colour indicated by its name. Lady Ridgway, Milano, Mrs. J. W. Barks, the golden bronze sport from Edith Tabor, are all in good form, and make very attractive-looking blooms. Lady Isabel, delicate silvery pink, was seen last season, and so too was Duke of Wellington, a big solid Japanese incurved of deep golden bronze.

In the old section of florists' incurved there are a few representatives, Miss M. A. Haggas, Mrs. Heale, Austin Cannell, Violet Tomlin, very bright and fine; all the Princess family, Globe d'Or, C. H. Curtis, Mrs. R. C. Kingston, and others being of the number.

NEW LATE PLUM.

OF the several kinds of hardy fruits grown in British gardens the plum is second only in usefulness to the apple, and therefore a promising addition to the list of varieties can hardly fail to be regarded with much favour by the general body of fruit growers. This being the case, it is not surprising that the variety, of which a characteristic illustration is given herewith, should have created much interest and obtained distinction when submitted to the Fruit Committee of the Royal Horticultural Society on the occasion of the first of the two meetings held by that body in October. Primate is the name this handsome plum has received, and, like so many of the varieties now so largely grown, it had its origin in the Sawbridgeworth Nurseries. The fruits, which are so admirably depicted by our artist, are large and handsome, and in the matter of appearance they have no superiors. The size and shape of the fruits are so well portrayed that no description is necessary beyond stating that they are herewith represented their natural size. The skin is bright purplish red, with heavy bloom, and marked with numerous small dots; the flesh is yellowish, rich, and juicy, and when the fruits are fully ripe parts readily from the stone. The productiveness of the tree, the large size, attractive appearance and high quality of the fruit fully justify the award of merit which was made in its favour by the R.H.S. Fruit Committee, but it has another claim for consideration, and that is the late period of the season when it attains maturity. The exact date of ripening depends upon the weather experienced during the summer, but in ordinary seasons it may be had in perfection throughout the month of October. The cluster of fruits here figured when received from Messrs. T. Rivers and Son at the middle of the month was not fully ripe, and remained in excellent condition until quite the close. Messrs. Rivers have introduced a large number of plums to cultivation, a considerable proportion of which are now extensively grown for market as well as for home consumption, and this, the latest of their productions, promises to be not less useful than the best of the additions they have previously made to the culinary section. Of mid-season plums we have perhaps sufficient to meet general requirements, but very early and very late varieties are still required, and the Messrs. Rivers are rendering a service to the community in their endeavour, which has already been attended with so much success, to meet this admitted want. Another valuable late culinary plum raised and introduced by this firm is Autumn Compote, a productive variety, producing handsome finely-flavoured fruits, which ripen a fortnight or three weeks after Victoria. They have also been successful in raising several dessert plums of much value, both for their high quality and the late period at which the fruit ripens. The more important of these are Grand Duke, in season during the early part of October; Monarch, an especially good variety, available during the second half of September; and Late Orange, in perfection during October. All these varieties, with the addition of Primate, should be planted in gardens where plums are required for as long a period as possible

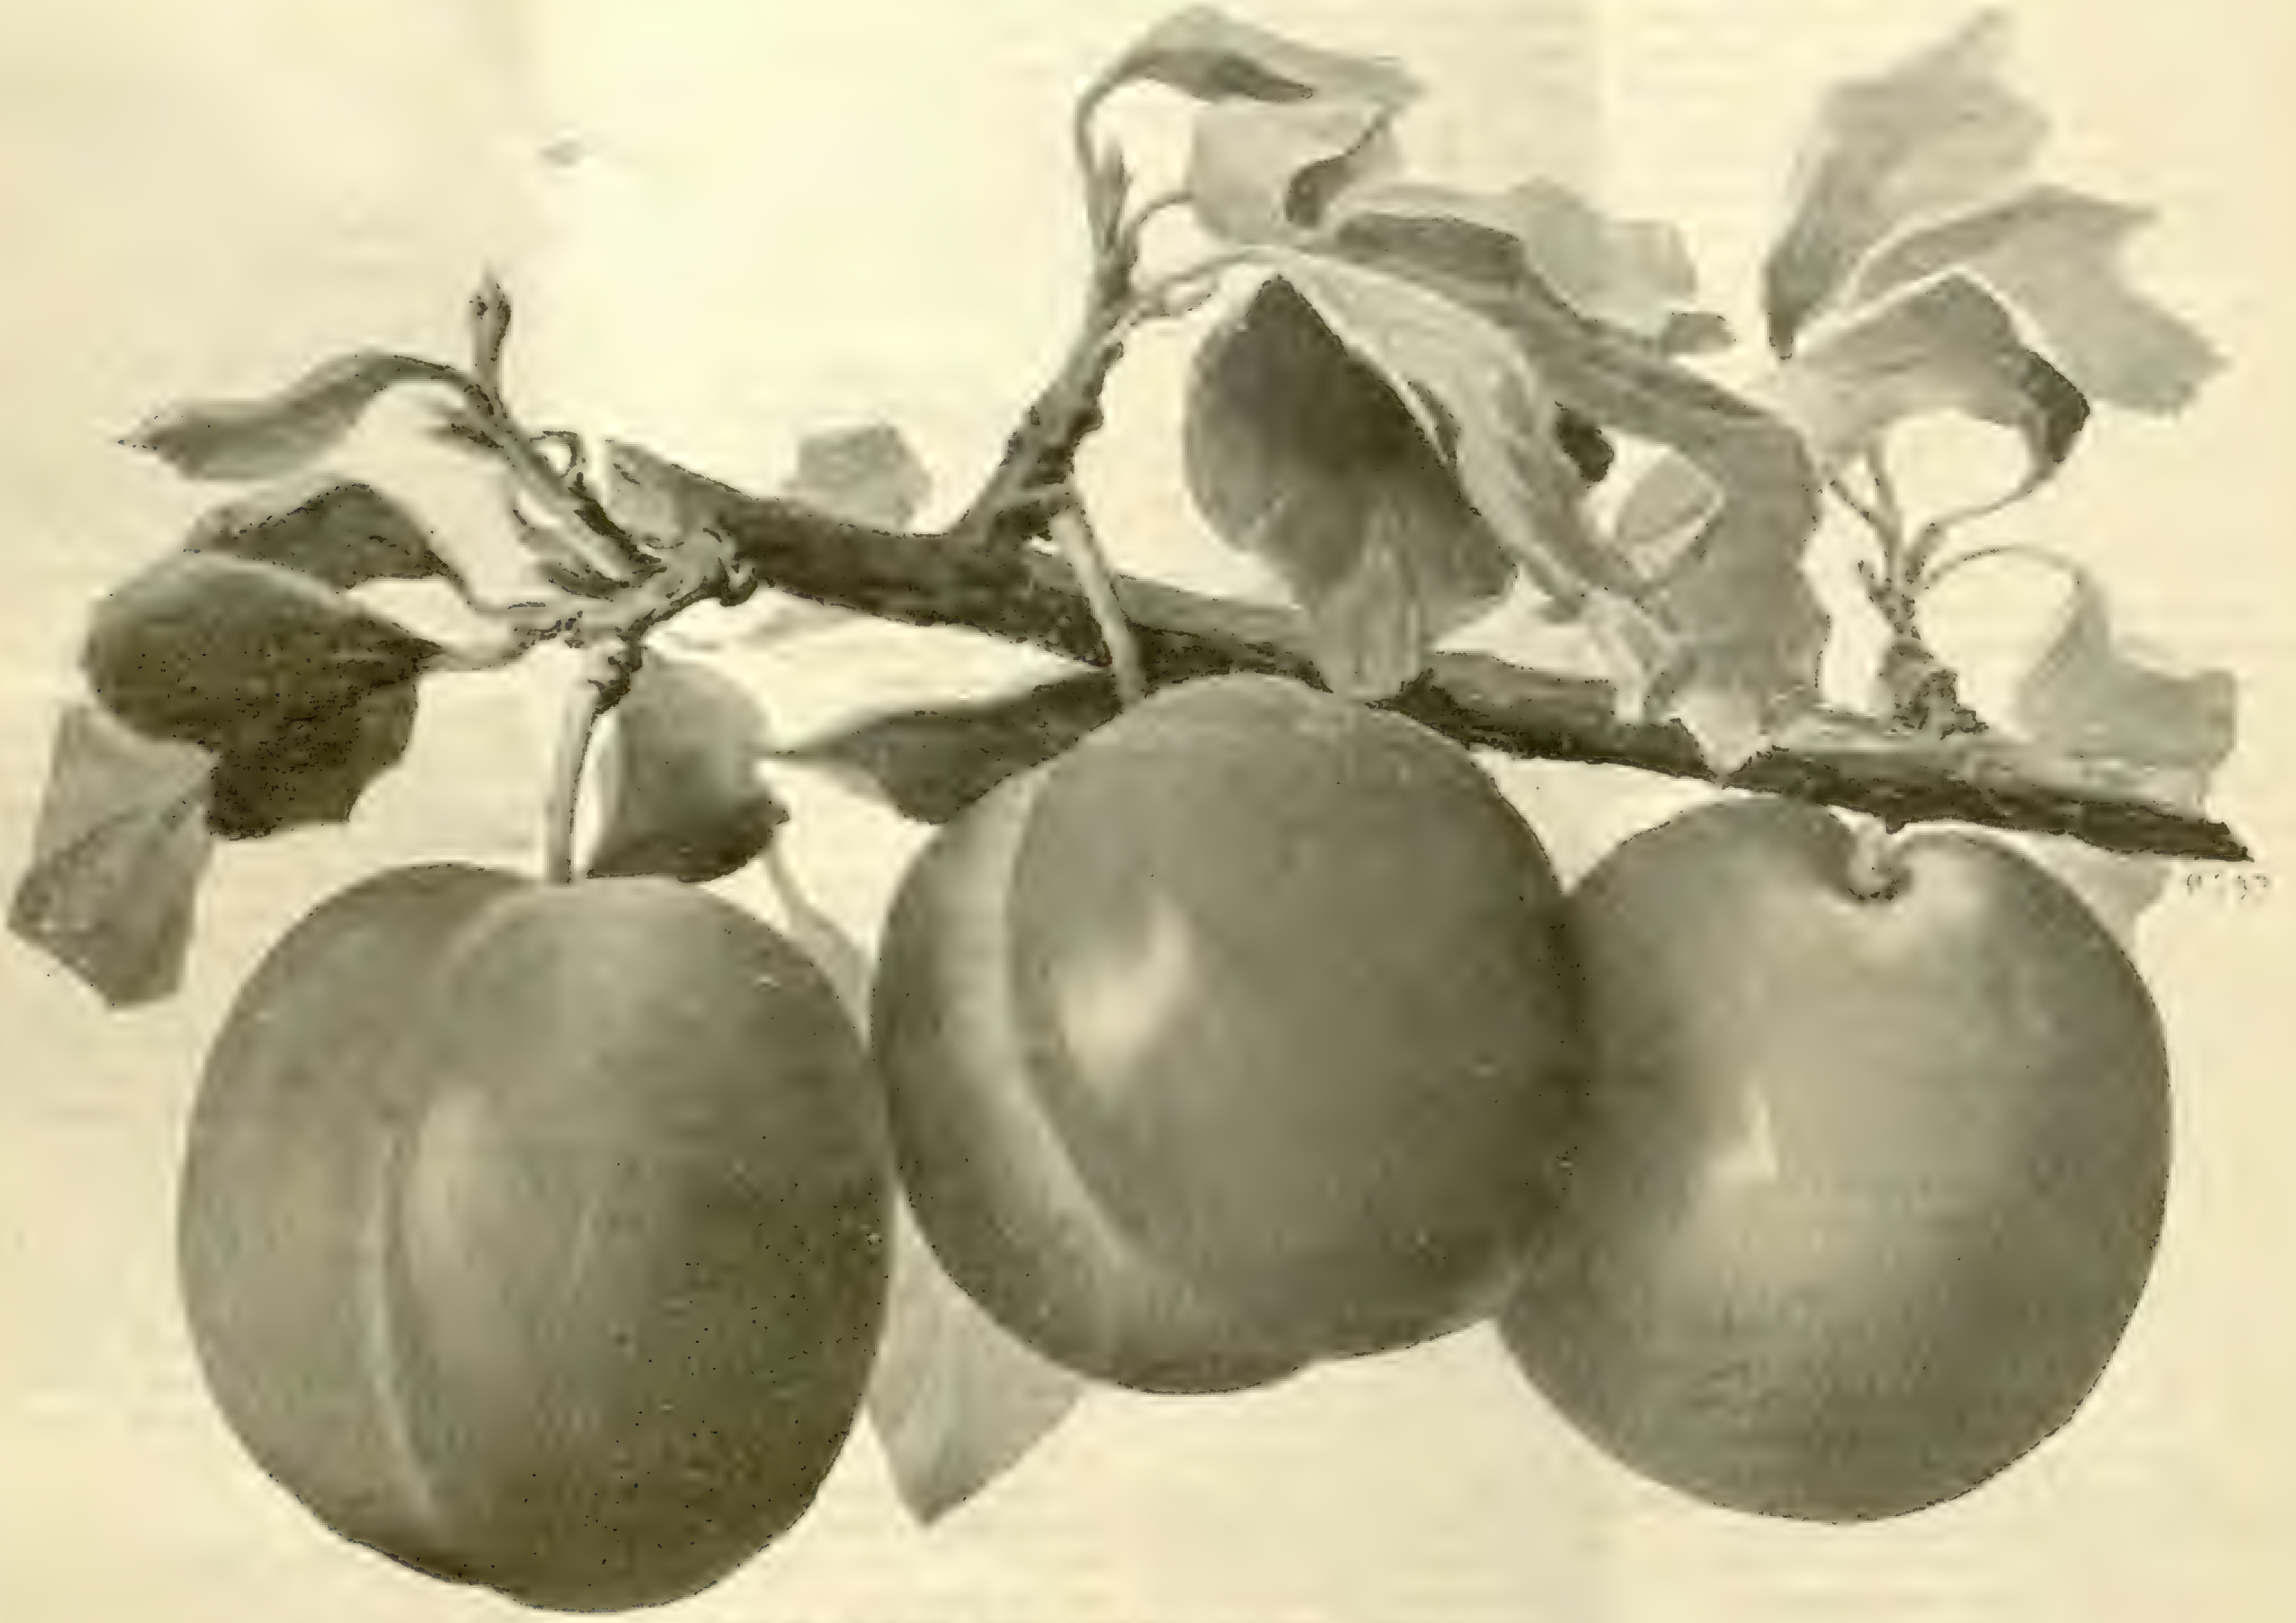
NEW PLANTS.

CATTLEYA MARONI.

A BEAUTIFUL orchid carrying a fine spike of seven large flowers with bronzy-yellow coloured sepals and petals and rich rosy-crimson lip. This grand orchid is the result of crossing Cattleya velutina with C. aurea, and certainly both parents are evident in the progeny. The flowers measure four and a-half inches across, but the petals bend forward rather than spread out; these are of a curious shade of bronzy-yellow or old gold with slightly deeper veins. The lip has a long tube composed of the clasping buff, rose-margined side lobes; the throat is brilliant golden-orange with scarlet markings, but the broad apex is two inches across, frilled, crisped, and waved, rich rosy crimson with deeper veins, and a buff tinge in the ground colour of the extreme tip. This is a strong grower, and, if it can be put on the market, it cannot fail to become popular. The accompanying page illustration represents the spike as staged at the recent Drill Hall meeting, where it was greatly admired, and generally considered to be one of the most distinct and beautiful hybrids yet raised. F.C.C., R.H.S., October 25. Mons. Charles Maron, 3, Rue de Montgeron, Brunoy, France.

RHODODENDRON YUNNANENSE.

This is a pretty erect-growing species from Yunnan; it has very dark green leafage and white flowers that have a few oblong red spots towards the bases of the upper lobes. The species is perfectly hardy at Kew, where it has been in cultivation since 1894. It is one of the Abbé Delavay's discoveries, and was found at Houang-li-pin, in Yunnan. A peculiar feature of the plant is that the leaves are sparsely covered with short stiff hairs. *Bot. Mag.*, t. 7,614.



NEW LATE CULINARY PLUM, PRIMATE.

LOBELIA INTERTEXTA.

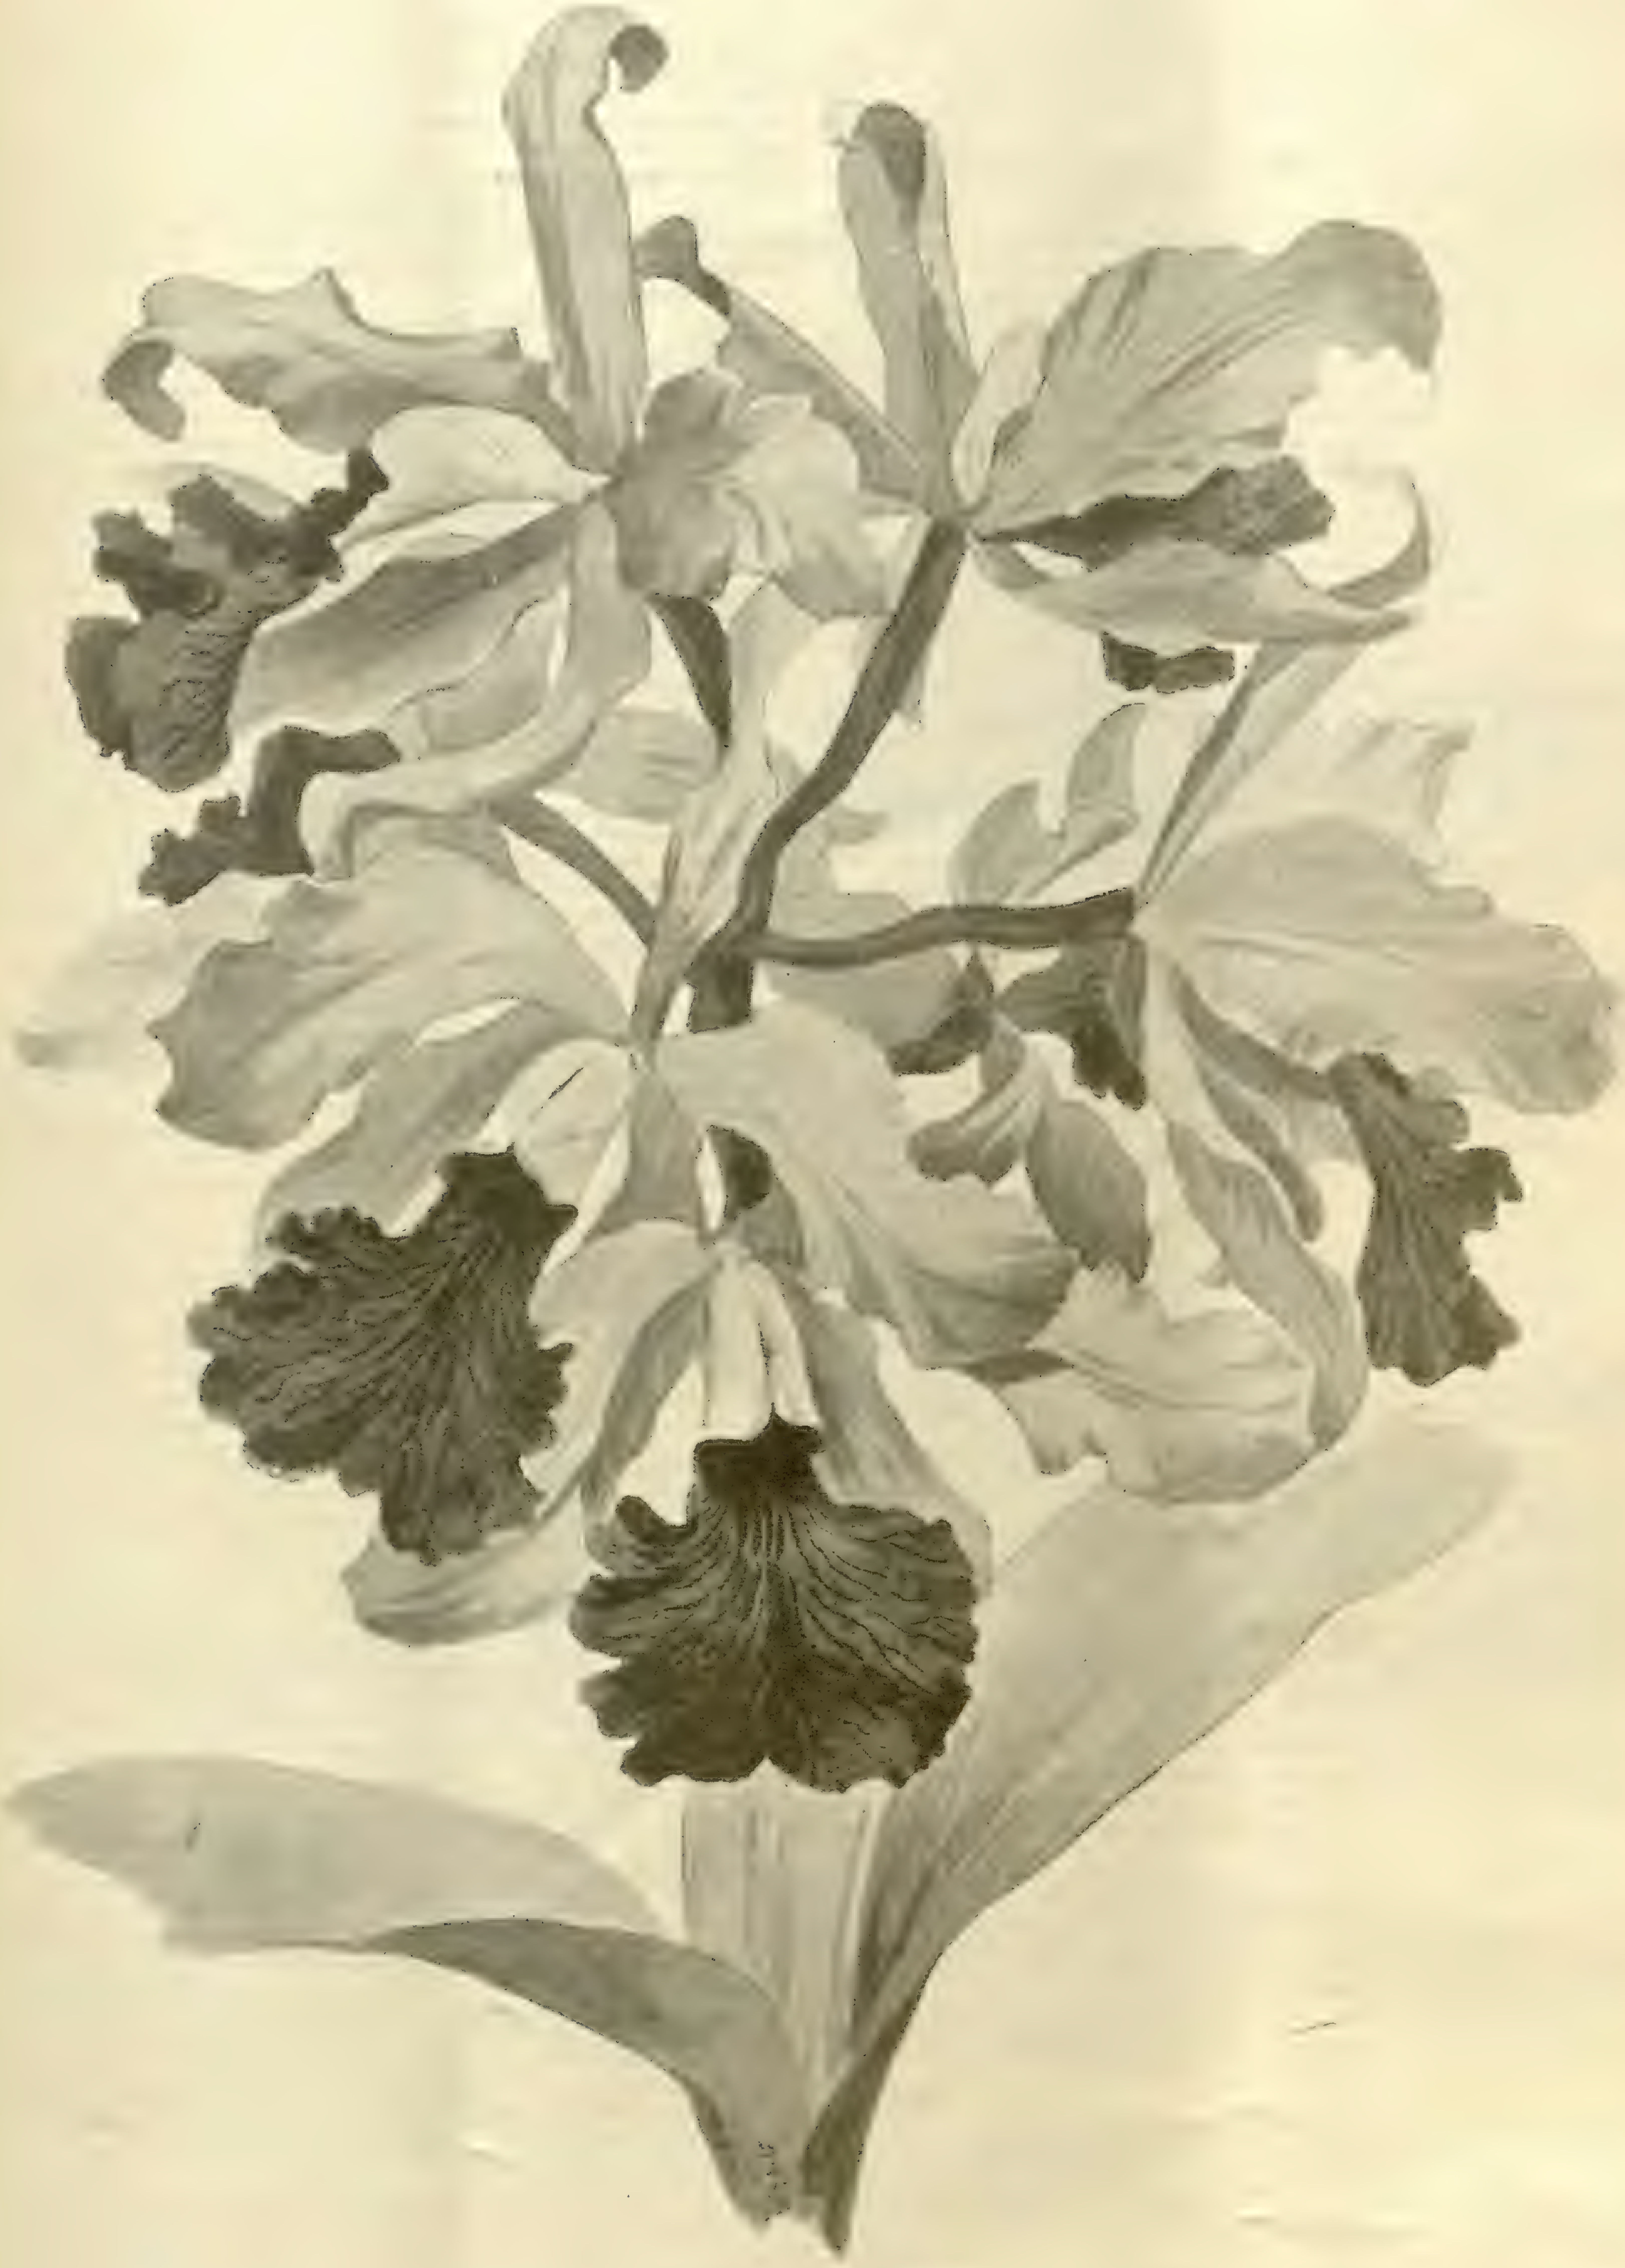
This native of British Central Africa closely resembles Lobelia erinus bicolor, and was discovered by Mr. A C Whyte, F.L.S., superintendent of the Forest Department. It is a slender, diffusely-branched annual with broadly ovate leaves; the flowers are white at the base and wholly violet beyond the middle; there are two large violet spots placed at the junction of the two large lobes with the central one. At Kew Lobelia intertexta has been grown in a warm house, where it flowered in December, and made a pretty, profuse-flowering pot plant. *Bot. Mag.*, t. 7,615.

CALLISTEPHUS HORTENSIS.

This is the wild form of the well-known China aster, and is figured in the *Bot. Mag.*, t. 7,616, because good illustrations of the type are extremely rare. The indigenous form is found in abundance on rocky hills in Northern China, from Pekin to the Yang-tse-Kiang; it is also found as far west as Afghanistan and Eastern Turkestan, though here, as in Japan, it is probably only known in cultivation. The species was probably introduced in 1731, and at an early date its usefulness was recognised, and florists found in it a plant that responded to their efforts readily. Plants flowered at Kew last autumn as the result of sowing seed collected in Eastern Szechuan by Abbé Farges.

CYRTOSPERMA SENEGALENSE.

A curious aroid from Upper Guinea, having an oblong lanceolate spathe from a foot to eighteen inches in length, green, red-clouded without, and yellowish-green, striped with red-brown within; the spadix does not exceed six inches in length, is blunt and stout, dark violet purple. The root stock of this quaint plant is a large tuber; the leaves are sagittate, oblong, about a foot broad by six inches across. It is a stove plant, and at Kew the spathes lasted in good condition for over two months. *Bot. Mag.*, t. 7,617.



CATTLEYA MARONI.

CYTISUS PURGANS.

A bright-flowered broom of dwarf habit, and producing abundance of golden blossoms during May. The species is plentiful in the southern half of France and in the northern part of Spain, and found growing freely in rocky districts. It was introduced to cultivation in this country as long ago as 1768, and was formerly regarded as of economic value; it has no place, however, in modern medicine, and does not ever seem to have been much valued as a purgative. C. purgans is a handsome and effective flowering shrub. *Bot. Mag.*, t. 7,618.

AMELANCHIER CANADENSIS OBLONGIFOLIA.

The common June berry or Service berry is well known and appreciated as one of the most beautiful of our hardy and early-flowering trees, but the variety figured as Amelanchier canadensis oblongifolia in the *Bot. Mag.*, t. 7,619, is not so well known as the type. It differs from the species in its smaller size, shrubby habit, and less sharply serrated leaves, the latter having a tomentose under surface. The flowers are bolder, and the resulting fruit more juicy, than in the species. This variety is known in New Brunswick as the Swamp Sugar Pear; it is plentiful near the River Saskatchewan, where the Cree Indians use the wood for pipe stems and arrows.

FEIJOA SELLOWIANA.

This is an erect-growing shrub allied to Psidium; it has opposite, oblong, shining green leaves and handsome drooping flowers two inches across. The latter has a whitish calyx with reflexed lobes; the orbicular petals are white on the outer and blood-red on the inner surface, save for a white margin. The stamens are very numerous, spreading into a large, broad tuft, rich blood-red, tipped with tiny yellow anthers. The fruit somewhat resembles a guava, and has a richly aromatic odour and flavour. Feijoa Sellowiana is a native of Brazil and Uruguay, and it commemorates Don J. da Silva Feijo, of San Sebastian Natural History Museum, and M. Fr. Sellow, of Potsdam, the energetic collector who discovered it. *Bot. Mag.*, t. 7,620.

RHODODENDRON RUBIGINOSUM.

Yet another rhododendron from Yunnan, and also discovered by the Abbé Delavay. It appears to be closely allied to R. punctatum, an American species, and Sir J. D. Hooker, in the *Bot. Mag.*, t 7,621, states: "It is difficult to say how the two are to be distinguished, except by the much larger flowers of the Chinese plant, which has disproportionately large, highly-coloured anthers and much less hairy filaments." R. rubiginosum is quite hardy at Kew, where it produces its bright rose-coloured flowers in April and May. The specimen was obtained from Messrs. J. Veitch and Sons, Chelsea. *Bot. Mag.*, t. 7,621.

CHRYSANTHEMUMS.

Waterlow Park.

FROM an educational standpoint the show of chrysanthemums at this popular North London park bids fair to rival any other existing public display of the kind. Very nearly 3,000 plants, in almost endless variety, are well represented, and on the occasion of our visit were seen in their best and freshest condition. Good culture characterised the great bulk of the plants, and we rarely, if ever, have seen the chrysanthemums turned out better at this establishment. The collection does not contain as many of the new introductions as one would expect to find, and this is a pity, as North Londoners are so apt to make comparison with other displays in the immediate neighbourhood.

The most conspicuous of the newer Japanese varieties were Mrs. S. C. Probyn, a good incurved Japanese of fine form and substance, of a pale pink colour; Yellow Carnot (G. J. Warren), which looked very promising; Emily Silsbury, one of the best white, and a very easy sort to grow; Pride of Exmouth, a large pale pink, almost white on early flowers; Lady Byron, a very grand white Modesto; Duchess of Wellington, a good yellow of spreading form; and Mons. Edouard André. Of the older Japanese varieties there were several notable examples of cultural skill, and good colour in the majority of the flowers was a special feature of the display. Phœbus, probably the most popular of all yellow, was in grand form; Mrs. E. G. Hill, an undoubted semi-early flower of a pretty pale blush pink colour; Gloire du Rocher, brilliant crimson and golden; Australian Gold, straw yellow; William Seward and J. Shrimpton, two distinct shades of crimson; A. H. Neve, still very pretty; Eda Prass, a very lovely soft pink; Avalanche, the white of a few years since, still popular here, and the members of the Viviand Morel family each call for special notice. This last lot of plants promised some very large full flowers.

Incurved varieties were rather sparsely represented, but what there were of them answered well the purpose of illustration to the admiring throng of visitors. Baron Hirsch has rarely been seen with blooms of such rich colouring, while the beautiful blooms of the Rundle family are freely represented. Anemones, such as Descartes, the rich coloured bright crimson red, are grown in a free manner, and for decorative effect are most attractive and striking. Pompons are always an interesting feature here, and a nice variety, including white and yellow Mdlle. Marthe, the glorious William Westlake, President, Black Douglas, Mdlle. Elise Dordan, Emily Rowbottom, and several others contributed largely to a pretty and effective arrangement of the fine range of glasshouses here. To Mr. Webb, the grower, praise is due for a notable advance in quality. The natural picturesque character of the park shows the skilful handling of Mr. Pallett, under whose superintendence the outdoor display has been improving each year. A wise selection of early flowering chrysanthemums has kept the beds and borders quite gay for some time past, and even so late as the last week in October there is plenty to interest the visitors to the park from this source alone.

It is a pity the Parks Committee are not just a little more liberal in the purchase of a larger number of first-rate novelties, as this is probably one of the best means of creating an interest, and also keeping alive the interest, too, in the autumn queen.

VISITOR.

The Experimental Farm, rented and managed by the Agricultural Department of the University of North Wales, Bangor, was opened recently by Mr. Long, M.P. The farm is 358 acres in extent, and is at Lledwigan, Anglesea, and here the theoretical information given at the college will be experimentally illustrated. The Professor of Agriculture at the University will reside at and manage the farm, with the assistance of a small committee of practical farmers, who will see to the equipment, stocking, and cropping of the farm, and control the finances. Towards the maintenance of this farm the Board of Agriculture make a special grant of £200, and in this connection it is interesting to note that the Bangor University College was the first in the kingdom to apply for and make use of the grant voted by Parliament for agricultural education.

WORK FOR THE WEEK.

WARM ORCHIDS.

VANDA SANDERIANA, the king of the genus, seems to be more popular now than formerly, and certainly is the very finest of all the vandas, and ought to be grown more extensively. Though high priced it is deserving of a place in every collection. It is far the best plan to purchase a good strong specimen at first, large enough to lead one to expect flowers, and, indeed, this should be the case with all this section of vandas; for if small plants are purchased it means years and years of culture before they attain a flowering stage. The species mentioned thrives well if grown in the cattleya house; it enjoys abundance of water when growing freely, with a diminished supply when resting. It also enjoys basket culture, and to be suspended from the roof. There are many opinions with regard to the culture of Vanda teres; some growers never allow it to be removed from the house where it is grown, and never allow any rest, keeping it in a hothouse all through the winter months; others practise the extreme, and remove their plants annually to the coolest house. I advocate a medium method; we grow them successfully in plenty of heat during the growing season (in the dendrobium house), and when the growing season is over they are placed on a shelf close to the glass, kept dry at the roots, only sufficient water being allowed to keep the growths firm, and under such treatment they flower luxuriantly year after year.

Dendrobium phalænopsis Schroderianum will in most collections be making a fine display, and they are grand orchids at this season of the year. Less water at the roots and also in the atmosphere must be provided now the flowers are open, but sufficient water is required to enable them to finish flowering prior to their having a good rest. Particular attention at this season must be paid to a steady temperature, especially under the present conditions of the weather, as we have occasional cold nights. The bottom ventilators must be kept open night and day when convenient, but sufficient heat must be kept in the pipes to keep up a temperature of, say, 65 degrees at night. Cattleya Bowringiana will now be brightening our cattleya houses, and is well worth cultivating; the water supply must also be checked for this species. C. labiata autumnalis will also be flowering. This has become so cheap that it is within reach of anyone who has a glasshouse; it is also of easy culture, and invaluable for cut flowers at this time of the year. The plants, however, have a bad fault of rotting off at the top of the bulb when the flowering season is over; a good plan to stop this is to withhold water and cut away the affected part as far as the rot penetrates, and rub the cut surface with dry lime or flower of sulphur. Cockroaches and beetles will be troubling orchid growers now in the warm houses, so must be trapped.

The temperatures at night should be: East Indian house, 70 degrees; cattleya house, about 62 degrees; and cypripedium house, 65 degrees, allowing a few degrees rise by day in fine weather.—T. STAFFORD, *Tyntesfield Gardens.*

STOVE PLANTS.

A NUMBER of cuttings of each variety of coleus should be put in to afford stock for propagating from in the spring, these wintering better and occupying less space than the old plants. Continue to introduce batches of Poinsettia, Euphorbia jacquinaflora, Plumbago rosea, justicias, &c., to the stove, so as to maintain a regular succession of bloom; see that each plant receives plenty of light, so that the leaves may be retained, an accompaniment of plenty of clean, healthy foliage tending to show off the flowers to the greatest advantage. Afford these, and all other plants in active growth, stimulants regularly, but not so strong as they are usually applied earlier in the season. When either flowers or bracts are fully expanded remove the plants to a cooler and drier house, where they will retain their beauty much longer than in a warm, moist stove. Attend carefully to the wants of succession plants of Poinsettia, Eranthemum pulchellum, E. Andersonianum, Centropogon Lucyanus, and Thyrsacanthus rutilans, and while giving them sufficient water for their requirements be careful that they are not overwatered. Examine them regularly to see that no insect pests have gained a footing, and should any be found adopt means for their destruction at once, as these troublesome disturbers of the peace of a gardener's mind increase rapidly now that the syringe can be less liberally applied, and that, owing to the rapidly decreasing light, the atmosphere has to be kept less humid. Begonia Knowslyana, B. corallina, B. President Carnot, B. Ingrami, are flowering freely in a house with a temperature of 58 degrees by night and 63 degrees by day, and their flowers are extremely useful at this season; a sprinkling of a good artificial fertilizer once a fortnight, with an intermediate watering with soot water, suits them admirably. When watering care must be taken not to wet the foliage or to spill water about. Saintpaulia ionantha is flowering in the same house; this is a lovely little subject, and should be grown in all gardens.

Bougainvilleas must now be gradually dried off, and the leaves as they fall should be gathered up daily, especially those which fall upon the foliage of other plants beneath. Encourage allamandas to go to rest by gradually reducing the supply of water; when the leaves have fallen shorten the shoots, and, if of a movable size, place the plants at the back of the stove, but do not stand them too near the hot-water pipes. Clerodendrons may be treated similarly to allamandas, only that no shortening of the shoots should take place until the plants are pruned for starting again. Keep ixias moderately dry at the roots, and shorten back the shoots if not already done. A few plants of gardenias set with buds may be introduced at intervals from the intermediate house where they are resting, and stood in a light position at the warmest end of the stove; afford them stimulants regularly; see that they are free from insect pests before the flowers begin to expand. Phrynium variegatum is apt to become infested with red spider at this season, and must be regularly sponged, else the leaves will soon lose their beauty. Plants standing in positions where the light only reaches them from the one side should be turned regularly, so that they may be kept from inclining to one side. Those plants in small pots for table decorations should be stood on a moisture-holding base, and have the pots twisted round frequently to prevent the plants rooting into the ashes, small gravel, or whatever the material they are standing on may be. On very dull days one syringing will be sufficient; in lieu of a second syringing overhead damp freely amongst the pots and on the paths, and keep the evaporating troughs regularly filled.—J. TUNNINGTON, *Ripley Castle Gardens.*

THE FLOWER GARDEN.

WHERE not already accomplished a general clearance of the remains of summer bedding should now take place. With the much-desired rainfall we have recently had the lifting and planting of various subjects, as small conifers, wallflowers, violas, and others, may be safely carried out. The beds should be previously dug over two spits in depth, and any manuring necessary be given now, thus leaving the beds to be simply dug over when the summer bedding-out comes round again. In large gardens, or where there are beds of good size, small conifers and flowering shrubs may be effectually employed for winter and [illegible] decoration. Large beds, or those occupying central positions in flower [illegible] of considerable size, may be thinly planted with small retinosporas, [illegible] as R. plumosa, R. pisifera, R. p. aurea, R. ericoides, R. squarrosa, and several forms of Cupressus Lawsoniana and thuias in variety. Among flowering shrubs that should be planted well set with flower buds, hybrid rhododendrons are the most important, and others that may be used are the early flowering Andromeda floribunda and A. japonica, Lauristinus, Berberis Darwini, and berried plants of Pernettya mucronata. Euonymus in variety are also admissible, and the early-flowering heath, Erica herbacea carnea. The small conifers, when used annually, do not increase materially in size for some years, and form compact root masses that render transplantation easy. The beds may be edged with a broad band of violas of suitable colour or other spring flowering subjects, as wallflowers, myosotis, Silene pendula compacta, and, if sparingly planted with conifers or flowering shrubs, a groundwork may also be used of similar materials. All spring flowering plants should be in their permanent quarters as soon as possible after this date where not yet planted; the same remark will also apply to bulbs of all kinds used for this purpose.

Sub-tropical and all half-hardy plants, as fuchsias, abutilons, cannas, Aloysia citriodora, specimen heliotropes, and other such like subjects that it may be desired to preserve for another season, should be housed forthwith or placed in [illegible] temporary shelter out of the reach of frost, for, although extremely mild up [illegible] the time of writing, frost may now set in any night sufficient to kill tender plants. Tuberous begonias also should be lifted, and laid close together in boxes, allowing a little of the soil to adhere to the tubers, and these may be stored in a cool greenhouse out of the reach of drip and away from hot-water pipes, avoiding either extreme of dryness or damp, and they will take care of themselves until the spring. Gladiolus in variety may also now be lifted, the foliage having matured. The corms should be dug up and laid out in a shed, or on the floor of a greenhouse or vinery, until the tops part easily from the corms, when the latter should be stored out of the reach of frost, and may be placed in their varieties in bags or drawers until the spring. Some varieties, as Colvillei, Byzantinus, and the old Brenchleyensis, may remain in the ground if desired, provided they are planted at a depth of four inches, and in the event of severe frost some coal ashes are spread over the surface as an additional protection.

Where rose planting is contemplated preparations should now be made for this operation, as the present month is the most suitable time, if the weather remains open, for planting roses of all descriptions; and, if early planted and mulched with half-rotten manure, the trees become partially established before severe frosts occur. Also where existing beds have become impoverished the plants should now be lifted and laid in by the heels elsewhere while the beds are trenched and manured, and some new loam also incorporated, if circumstances permit, removing a corresponding part of the old soil that the beds be not over-full. Make the soil compact by well treading over the beds before planting, and when this is done allow ample space for development, according to the strength of the variety. Remove any broken roots and shorten others that are long and fibreless, planting at a depth similar to that at which they have previously been growing. Make the [illegible] firm about the roots, and stake and tie if necessary to prevent any swaying [illegible] wind. Most roses flourish in a good retentive loam approaching to brick earth, and where the staple is light means must be taken to make it heavier by working in loam of a clayey nature, removing some of the lighter to make room for it. If the soil is generally light and porous a six-inch layer of clay may with advantage be placed about eighteen inches under the bed, which will assist in retaining moisture.—C. HERRIN, *Dropmore Gardens*.

HARDY FRUITS.

MOST hardy fruits will now be in the store-room, though in spite of the heat and drought fruits have matured later than usual. We have only this week cleared our latest pears; the trees are somewhat sheltered, and we always allow the fruits to remain as long as possible, so that they may keep good till after Christmas. Examine the stored fruit often, and remove bad fruits, so that they do not affect others. It is full late to write about plums, but much the same remarks apply to these as to late pears, as the trees of Coe's Golden Drop and Wyedale have only just been cleared, though, of course, it has been necessary to keep them netted. These plums will keep a considerable time if each fruit is wrapped in tissue paper and placed in a close drawer; indeed, I have had Coe's good at Christmas treated thus. It happens sometimes that one has a batch of fruit trees in pots that were grown in houses recently planted, but now there is no room for the pot trees indoors. I recently saw some splendid crops from such fruit trees placed in a sheltered border between some span-roof houses, as in that position it was an easy matter to protect them when in bloom. In many parts of the country, south and west, excellent crops may be had from standard peach trees, and the fruits are of excellent quality, as the exposure to full air and light is so favourable to ripening. Of course, grown thus, only early kinds are advised, and to these [illegible] added the new nectarine Early Rivers; indeed, this excellent variety promises well. I need not dwell upon this mode of culture other than to note that it is essential to pay the trees ample attention, and to be a success there must be stopping and disbudding, thinning and feeding, for it is important to have the trees [illegible] and sufficiently thin to admit light and air. Figs in cold localities do not [illegible] on open walls, but with some little protection they would do well in pots. Many could grow figs thus who cannot devote a house to their culture, and if [illegible] in the winter or early spring and placed out in May they give a good crop of late fruit. Of course only one crop can be taken, and the plants, to save [illegible], may be plunged due south, and well fed. Now is a good time to pot up new stock, repot older ones, and top-dress any not potted.

October is usually the month advised for lifting such fruit trees as need a check to promote a fruitful growth, but until now the soil has not been in a fit state for the work, being so dry that lifting was delayed. In many cases it is not necessary [illegible] take out the trees, but merely to work under them, and cut coarse roots going [illegible] down into the subsoil. This only applies to older trees, and with such [illegible] be well to take two seasons to do the work, as by so doing the crop [illegible] be sacrificed any one year. Peach and nectarine trees on walls should [illegible] early attention, and at the time of penning these lines, the last week in [illegible], we are lifting a goodly number of trees, some to fill up gaps, and others [illegible] are growing too strong. This latter evil is soon rectified at this [illegible] it does not mean mutilating the roots, but preserving all the small [illegible] and giving any strong ones a clean cut at a sufficient distance from [illegible] that it may be induced to make a fibrous growth; by so doing fruiting [illegible] be made instead of gross growth. Peaches and nectarines are best lifted [illegible] leaves fall, but at this date any other trees may be transplanted. Cherries [illegible] should have the earliest attention, as these are the first to start in the [illegible]. Plums are making a late growth and may be left till last, but even these, [illegible] and apples, may now be moved safely; indeed, the work is best done [illegible] weather is open. The soil for fruit trees is an important matter; now [illegible] time to bring material together, and if at all dry this should be spread out to let the rain moisten it. In heavy land of a clayey nature drainage will be an important detail; this may be secured, and at small cost. When in the North I could not grow some kinds of fruits until a regular system of drainage was adopted for all young trees. Such materials as old mortar rubble, burnt refuse, wood ashes and road scrapings are of great value for mixing with heavy soils. It will also be advantageous to trench and dig the quarters for fruit trees. In the case of wall or border trees it is well to plant new trees in different positions to what older ones occupied, but if necessary to fill the same spot it will be well to wheel out a large portion of the old soil and replace with other of a better nature. I am greatly in favour of autumn as against spring planting, for having a very light soil to deal with, and on a gravel subsoil, late-planted trees suffer much in hot, dry summers. Gooseberry quarters should receive a good mulch of manure at this season, and if my advice earlier was carried out as to thinning out crowded wood when the crop was cleared there will be little pruning to do; the same remarks as regards food will apply to currants.—G. WYTHES, *Syon Gardens*.

AUSTRALIAN GRASSES.

THE marvellous abundance of beef and mutton in Australia is largely due not only to the enormous extent of the area devoted to pastoral purposes, but also to the rich luxuriance of the native grasses, of which, so far as is at present known, there are one hundred and ninety-eight species and thirty-three well-defined varieties indigenous to New South Wales. Out of this number are sixteen species which, when old, are somewhat dreaded by pastoralists in the interior districts, on account of their long seed awns, or sharp-pointed seeds or leaves. Most of these undesirable grasses are really good pasture plants while young, and it is only at the season of ripening their seeds that they become troublesome to sheep. Among the more valuable of the native grasses is the "bent grass," a slender, tufted grass, growing from six inches to one and a-half feet high, which, together with two other species of the same genus, forms a considerable percentage of the herbage in some pastures on the high table-lands, more particularly in the southern portion of the colony. During the summer months these grasses yield a fair amount of rich herbage, which sheep eat with avidity. The "blue grass" is generally found growing, from one to two feet high, in the coastal districts and in the colder parts of the colony. It grows on various soils, but it appears to succeed best and yield more herbage on those of a moderately strong loamy nature. In sheltered situations it makes considerable growth during the winter months; therefore it is doubly valuable to the grazier. Kangaroo grass and Mitchell grass also enjoy a good repute for their fattening qualities. The seeds of the latter at one time constituted an important food of the aborigines. Oat grass is found on the southern mountains, where it forms a considerable proportion of the alpine herbage. It generally attains a height of from four to five feet.

The wallaby grass is common throughout the colony. The love grass, of which there are several varieties, grows from one to four feet in height, both on good and on poor soils. When growing on good land these grasses yield a great amount of rich, succulent herbage, of which all herbivora are remarkably fond, and fatten on. The seeds usually ripen during the summer months. Twelve other species of the grass are found in the pastures in varying proportions over nearly the whole of the colony. Stockmen call certain of them "never fail," on account of their drought-enduring qualities. Many will withstand a phenomenal amount of dry weather, and most are excellent pasture grasses. The Australian millet is found over nearly the whole of the colony, from the coastal districts to the far interior, and in some places is very plentiful. In moist places, and by the side of watercourses, this grass grows four feet high, but on the plains it rarely exceeds a couple of feet in height. In all its varied forms it yields a valuable herbage. At one time the aborigines used to collect the seeds in great quantities, grind them between stones, make the meal into cakes, and use them as an article of food. The yellow-flowered panic-grass, growing from one to three feet in height, is generally found on the western plains. On good soils it gives a great quantity of rich, succulent herbage, and is said to be one of the best fattening grasses in the interior. It produces an enormous amount of seed; in fact, the panicles are often so full and heavy with grain that they are weighed down to the ground.

Twenty-eight other species of the grass are found in the colony, and they form a large percentage of the herbage in the pastures in the coastal districts, on the high table-lands, and in the interior. The sugar grass is most common in the interior districts, and when in flower is easily recognised amongst other grasses by its rich, brown, silky spikes. It is generally found growing on the richest of soils, and often on deep alluvial flats bordering rivers and creeks. During the summer months, in an ordinary season, it produces a great bulk of rich, succulent, sweet herbage, much relished by all herbivora. It attains a height of about four feet. The wild sorghum is found principally in the coastal districts, and in the colder parts of the colony, where it attains sometimes a height of five feet. In the New England district it is, when in flower, quite a feature in the pastures, and is regarded as a valuable grass. Horses are said to eat the seeds with avidity, and to thrive on them. In the colder portions of the colony it is a summer grass, but elsewhere it grows all the year round. These are a few only of the native grasses of New South Wales, but their abundance explains the general excellence of the beef and mutton raised in the colony, the use of oil cake and other artificial foods, so common in Europe, being infrequent in Australia, where, during the winter months, there is plenty of forage in the shape of hay made from the younger grasses. Imported grass seeds are employed in renovating old pastures, but the native grasses are always plentiful when the land is not systematically overstocked.

JOHN PLUMMER.

Sydney.

Vineries in Damp Weather.—With rainy weather following a prolonged drought an increase of fire heat will be necessary in vineries, as also will very careful top ventilation. The fire, though an absolute necessity, will be an evil if damp is not removed from the house at once. A strong heat, with a corresponding increase of top ventilation, is the correct thing. Grapes will steam and gather the damp, and with a lower outside temperature, especially at night, much damage may be quickly done. If up to this date all has been done that is required in the way of removing the superfluous ties, with also the smaller sub-laterals below and just above the bunches, the right thing has been attended to, but too often failures arise from want of attention in small matters. Cleanliness is essential in a house of hanging grapes, and of course no unnecessary water should be spilled about the path or borders. Keep the front ventilators tightly closed. Falling leaves should be taken away daily, as nothing holds damp more than decaying foliage. If there are cold houses of grapes these will want cutting quickly, even under the best of circumstances. Without making the vinery a hothouse, it should nevertheless be comfortable and dry.—STEPHEN CASTLE, F.R.H.S., *Bottesford Vineries, Notts.*

EXHIBITIONS AND MEETINGS.

WATFORD CHRYSANTHEMUM SOCIETY, November 1 and 2.

THIS society held its thirteenth annual display on the above dates in the spacious Clarendon Hall. The display seemed rather below the average in extent, though the quality of the exhibits was good. One missed, however, Mr. Beckett's contributions to the show. The Earl of Clarendon's gardener put up a grand group of flowering and foliage plants in the centre of the hall, while Messrs. Cutbush and Son, Scrivener and Son, Wood and Son, H. Lane and Son, and Mr. D. Hill put up excellent and varied non-competitive displays.

GROUPS AND PLANTS.

In the class for a group of chrysanthemums Mr. W. Tidy, gardener to W. K. D'Arcy, Esq., Stanmore Hall, Middlesex, easily won the chief honours, which included a silver cup in addition to a good money prize. Mr. Tidy's group was rather heart-shaped than semi-circular, the lobes being raised slightly, as also was the centre at the back, falling slightly towards the front. The design was good, and the flowers also of considerable excellence, though quite a number had not expanded to their fullest extent. In the members' division the first prize for a group of chrysanthemums staged on a space of fifty square feet was won by Mr. Wilson, gardener to H. J. Jourdan, Esq., C.M.G., The Elms, Watford, who had a good exhibit of dwarf plants carrying fine flowers; a three guinea cup accompanied the money prize. Mr. J. Wilks, gardener to J. Dunbar Thomas, Esq., Elmdene, Pinner, secured the second award, though a little more care in staging might have resulted in the higher prize.

Low groups of miscellaneous plants are always a successful feature at the Watford shows, these alternating with the chrysanthemums round the hall. On this occasion Mr. W. Tidy beat all comers in the open class, with a tasteful and light arrangement of palms, crotons, calanthes, dracænas, and cypripediums over a dense bed of deep green maidenhair fern; caladiums, peperomas, and ferns formed a suitable edging. Mr. C. Brown, gardener to Viscount Esher, was second, his cattleyas being very good, but dominating the other subjects too much; Mr. C. Worsley, Bushey, third. In the members' section the first prize for a miscellaneous group of plants was awarded to Mr. H. Reed, gardener to Mrs. Moon, Cassio Bridge, Watford, who had a group planned on the same principle as Mr. Tidy's, but producing a rather brighter effect by a judicious use of cattleyas and Vanda cærulea. Mr. Tidy, who took a lion's share of the prizes, showed the best dozen, a pretty set of the usual subjects; Mr. C. Brown, gardener to Viscount Esher, Heath Farm, Watford, a good second. Mr. A. Canfield, gardener to W. Judge, Esq., Watford, showed the best group of chrysanthemums staged on a space of twenty-five feet, a loose but rather pretty group. Messrs. Richardson and Davis were successful exhibitors of primulas.

CUT BLOOMS.

Mr. J. Dinsmore, gardener to T. F. Blackwell, Esq., The Cedars, Harrow Weald, led in the class for twenty-four Japanese blooms, distinct, scoring with good specimens of Australie, Royal Sovereign, Simplicity, Eva Knowles, Mutual Friend, Joseph Brooks, Lady Hanham, and Graphic; Mrs. H. Weeks, Mrs. G. Carpenter, Phœbus, Lily Mountford, Mrs. G. W. Palmer, Pride of Madford, C. B. Haywood, and Oceana; Edith Tabor, Mrs. J. Bernard, Dorothy Seward, Mrs. W. H. Lees, Elthorne Beauty, Master James Epps, Lady Ridgeway, and Mons. M. Ricoud; the second prize was won by Mr. Gilbert, gardener to H. J. Lubbock, Esq., Newberries, Radlett. The best dozen Japanese blooms were shown by Mr. W. J. Roberts, gardener to G. T. Skilbeck, Esq., Harrow Weald, who put up very large specimens of Australie, Mutual Friend, Viviand Morel, Oceana, Mons. E. Andre, Edith Tabor, Beauty of Adelaide, Simplicity, Pride of Madford, Mrs. H. Weeks (best Japanese in the show), Mons. Chenon de Leche, and Phœbus; Mr. J. Wooster, gardener to V. M. Martin, Esq., Shenley Lodge, came second; and Mr. J. Cox, gardener to the Hon. A. Holland Hibbert, Watford, third.

There was a very keen competition in the members' division, in the class for two dozen Japanese varieties, distinct, Mr A. B. Higgins, gardener to R. P. Cooper, Esq., Berkhamsted, winning, his best flowers being Mutual Friend, Emily Silsbury, Modesto, Pride of Madford, and Robert Powell; Mr. J. Dinsmore scored a second. The best six Japanese blooms of one variety were specimens of Madame Gustave Henry, not over good, shown by Mr. W. Pummell, gardener to A. T. Ashwell, Esq., The Hermitage, Harrow Weald; Mr. Dinsmore, second, with Modesto; and Mr. Tidy, third, with Hairy Wonder. The best dozen Japanese blooms, members' class, were good blooms of Australie, Mutual Friend, Elthorne Beauty, Oceana, Mons. C. de Leche, Miss E. Teichmann, Beauty of Adelaide, Mrs. H. Weeks, Pride of Madford, Madame G. Henry, Mons. E. Andre, and Edith Tabor; Mr. J. Wooster, second; and Mr. J. Gilbert, third; there were six stands. In the section provided for members employing not more than three gardeners Mr. Fowler, gardener to the Rev. H. Burchell-Herne, Watford, was the chief prize winner in the class for two dozen Japanese blooms, with a good set. In another section Mr. G. Hill, gardener to Mrs. Part, Radlett, also gained a first prize for twelve Japanese, and also first for a dozen Japanese blooms.

Incurved blooms were good for this early date. For two dozen blooms, distinct, Mr. Tidy led the way with Mons. R Bahaunt, Jeanne d'Arc, Brookleigh Gem, Empress of India, Globe d'Or, J. Agate, Prince Alfred, and C. H. Curtis; Queen of England, Lord Wolseley, Golden Empress, Mons. F. Mistral, J. Lambert, Ami Hoste, Princess of Wales, and Lord Alcester; M. P. Martignac, Alfred Salter, Nil Desperandum, Princess Beatrice, Madame Darrier, Lucy Kendall, Mrs. Dixon, and John Salter; Mr. J, Dinsmore took the second award. Mr. Tidy also won first place for twelve incurved blooms, staging first-rate examples of Prince Alfred, C. H. Curtis, Mons. R. Bahaunt, Globe d'Or, M. P. Martignac, Brookleigh Gem, Jeanne d'Arc, Lord Wolseley, Mons. F. Mistral, Mrs. G. Rundle, Mrs. Dixon, and Princess Beatrice; Mr. C. Sims, gardener to Mr. T. S. Gooch, Birringdon, Hemel Hempstead, second. Five competitors entered in the class for six incurved blooms, one variety, Mr. Gilbert winning with large blooms of Baron Hirsch; Mr. Higgins, second, with Madame Darrier; and Mr. Tidy, third, with Mr. James Murray. In the members' division Mr. C. Sims led for a dozen incurved blooms, and Mr. Tidy second; there were seven stands in this class. In another division Mr. J. Wilks had the best twelve incurved blooms, and Mr. Davis came second. In yet another class for twelve incurved blooms, limited to small establishments, Mr. Hill was the successful competitor, his Globe d Or being very fine; Mr. Hill also had the best six incurved blooms. The best incurved bloom in the show was a flower of Mrs. James Murray, exhibited by Mr. W. Tidy.

Miss M. D. Smith, Oxhey Lane Farm, Watford, had the best epergne of chrysanthemums, a pretty arrangement. Miss Belgrove was first for table decoration, and deservedly so, the orange and yellow flowers being charmingly associated; Miss M. D. Smith, second. Miss Mead was a successful exhibitor of buttonhole bouquets, while Messrs. Scrivener and Co., Watford, were easily first for a wreath of white flowers, and also for a chrysanthemum bouquet; the best cross of flowers was also staged by this firm, who are charming floral artists.

VEGETABLES AND FRUIT.

Vegetables are always first-rate at Watford, but this year there was not so good a competition as usual. Mr. C. Brown, gardener to R. Henty, Esq., Abbots Langley, secured the Messrs. J. Carter and Co.'s prize for a collection of vegetables, with Mr. Fowler second. Mr. Brown also won the Messrs. Sutton's chief prize with fine produce, the Brussels sprouts being especially good; Mr. J. Fowler, second. Mr. G. Rickett, The Grove, Watford; Mr. Goldring, Hunton Bridge; Mr. C. Coleman, Abbots Langley; Mr. Hall, Church Road, Watford; and Mr. C. Brown were further winners of one or more first prizes in vegetable classes.

Mr. J. Dinsmore staged the best six dishes of fruit, showing good Alicante and Muscat of Alexandria grapes, Queen pineapple, Doyenne du Comice pears, Sandall plums, and Cox's Orange Pippin apples; Mr. A. B. Higgins came second; and Mr. Tidy had to be content with third place. Mr. Higgins staged the best three bunches of Muscat of Alexandria grapes, and Mr. Cox the second best lot. Mr. Tidy led for black grapes, with heavy, well-finished clusters of Black Alicante; Mr. Higgins, second; and Mr. G. Hill, third. Mr. J. Norton, gardener to D. Hill, Esq., Herga, Watford, had the best four dishes of apples—Cox's Orange Pippin, Blenheim Pippin, Peasgood's Nonsuch, and Warner's King; Mr. Tidy, second. Mr. H. Reid, Cassio Bridge, led for pears, showing Doyenne du Comice, Duchess d'Angoulême, Beurré Diel, and Beurré Clairgeau in fine form; Mr. Dinsmore, second. Messrs. Fowler, Wilson, Percival, Wild, and Shepherd were all leading prize winners.

KINGSTON CHRYSANTHEMUM SHOW, November 1 and 2.

REAL November weather ushered in the month of fogs and the season of chrysanthemum exhibitions. It was a dull, cheerless morning when the exhibitors staged their products at the Drill Hall on the occasion of the twenty-second annual show of the Kingston and Surbiton Society. Though not what they were of yore, the shows of Kingston are still good, and if groups of chrysanthemums are now wanting there are still good cut blooms. Some alteration in the general arrangement of the show produced a better effect than usual, and altogether, considering the difficulties it has to contend with, the Society is to be congratulated upon its most recent effort. We would also add that the committee effected a clearance of competitors and assistance five minutes before eleven o'clock, and so allowed the judges an opportunity of commencing at the proper time. So seldom is this so that we feel compelled to mention the fact.

GROUPS AND PLANTS.

There was nothing of special merit to record with respect to the groups. There are now no groups of chrysanthemums such as Kingston was formerly noted for, but for a miscellaneous group, in which twenty-five chrysanthemums had to be staged, the chief award fell to Mr. J. Lock, gardener to C. S. Eady, Esq., Q.C., Oatlands Lodge, Weybridge, who had a miniature lake and bridge, with orchids and stove plants in abundance; Mr. J. Hopkins, gardener to D. Salamon, Esq., Willowbrook, Hampton Hill, second; and Mr. Bolton, gardener to Mrs. Blacker, Coombe End, third. For four Japanese specimen plants the leading award was won by Mr. Brett, gardener to W. Campbell, Esq., Coombe Ridge, with W. H. Lincoln, Viviand Morel, Souvenir de Petite Amie, and Colonel W. B. Smith; Mr. S. Read, gardener to R. S. Bond, Esq., Crozlands, Surbiton, second. Mr. Plowman, gardener to C. L. Lavers-Smith, Esq., Long Ditton, led for a single bush specimen, with Mr. Brett second. The best half-dozen table plants were choice, neat dracænas, crotons, and aralias, staged by Mr. F. King, gardener to A. F. Perkins, Esq., Holmwood; Mr. McGregor, gardener to Lady Hay, Putney Hill, second; and Mr. Bolton, third. There was a keen competition in this class for the prizes offered by Mrs. V. Knapp. Messrs. F. King and S. Read won the leading awards for primulas.

CUT BLOOMS.

The eighth Champion Challenge Vase, valued at twenty-five guineas, was won on this occasion by Mr. F. King, gardener to A. F. Perkins, Esq., Oak Dene, Holmwood, and, having been previously won by the same gentleman, it is now his property. His was a fine and first-rate set of forty-eight blooms, and his Japanese varieties were John Seward, E. Molyneux, International, C. Davis, Madame T. Rey, Australie, Mrs. G. W. Palmer, Simplicity, Lady Hanham, Lady Northcote, Mrs. C. Orchard, Pride of Madford, G. J. Warren, Madame G. Bruant, Mrs. W. Mease, Phœbus, Pres. Nonin, Mons. E. Andre, Oceana, Madame Carnot, Mary Molyneux, Edith Tabor, R. Powell, and C. B. Haywood. The incurved varieties were Ma Perfection, Ernest Cannell, M. P. Martignac, Chrysanthème Bruant, Lady Isabel, J. Agate, Miss D. Foster, Duchess of Fife, Baron Hirsch, C. H. Curtis, Perle Dauphinoise, Mrs. N. Molyneux, M. R. Bahaunt, Globe d'Or, Yvonne Desblanc, D. B. Crane, Jeanne d'Arc, J. Pearce, Empress of India, Brookleigh Gem, Lord Alcester, Miss M. A. Haggas, Robert Petfield, and J. Lambert. Some of the incurved blooms were of exceptional excellence. Mr. G. J. Hunt, gardener to Pantia Ralli, Esq., Ashstead Park, Epsom, took second place with a fine lot of flowers; Mr. O. Smith, gardener to W. Addison, Esq., Kingston Hill, third; and Mr. J. Lock, Weybridge, fourth.

In the local class for a dozen Japanese blooms Mr. J. W. Forbes, gardener to Madame Nicols, Regent House, Surbiton, just managed to beat Mr. C. Smith. Other leading prize-winners in this section were Mr. Brett and Mr. Atkins, and Mr. Nagle for a dozen incurved.

Mr. S. Matthew, Surbiton Hill, won Mr. Furze's prize for twelve Japanese blooms, amateurs' section, while Mr. F. Bowler, Cricket Field, Esher, led for twelve Japanese, with a bright set of medium-sized flowers. Mr. J. Norris, Mr. E. Randel, and Mr. A. N. Smart were other winning amateurs.

In the open class for twenty-four incurved blooms, a Ryecroft medal, presented by Mr. H. J. Jones, Lewisham, accompanied the first prize. The chief honours fell to Mr. F. King, who was in fine form, and scored with good specimens of Duchess of Fife, Mons. Desblanc, Lady Isobel, C. H. Curtis, Percy Surman, Ernest Cannell, Miss D. Foster, and Ma Perfection; Globe d'Or, Miss M. A. Haggas, J. Doughty, Mrs. N. Molyneux, Perle Dauphinoise, Chrysanthème Bruant, Empress of India, and Lord Wolseley; Leonard Payne, Yvonne Desblanc, Robert Petfield, Jeanne d'Arc, J. Pearce, Lord Alcester, D. B. Crane, and Triomphe d'Eve. The best dozen incurved blooms came from Mr. Caryer, gardener to A. G. Meissner, Esq., Aldenholme, Weybridge, who won with clean examples of Topaze Orientale, Mrs. N. Molyneux, Miss Violet Tomlin, Miss V. Foster, Mr. T. Murray, Robert Petfield, Mr. R. C. Kingston, Globe d'Or, Mrs. Heale, Major Bonaffon, Baron Hirsch, and Madame Darrier; Mr. J. French, gardener to Mrs. Barclay, Wimbledon Park, second. For six incurved blooms the first prize was awarded to six huge but loose flowers of Duchess of Fife, shown by Mr. F. King; Mr. Brett, second, with C. H. Curtis.

There were some good competitions in the class for twenty-four Japanese blooms, distinct, and here the chief honour fell to Mr. J. F. McLeod, gardener to J. P. Morgan, Esq., Dover House, Roehampton; his varieties were Lady Ridgeway, Madame M. Ricoud, Mrs. G. Henri, Mons. Panckoucke, Australie, Mrs. G. Palmer, Lady E. Smith, and Pride of Madford; Lady Byron, Oceana, J. Chamberlain, Reine d'Angleterre, Sunflower, Chatsworth, Mrs. C. H. Payne, and Phœbus; James Bidencope, Mons. Chenon de Leche, Mons. Hoste, Lady Oporto Tait, Mrs. H. Probyn, Col. W. B. Smith, Edith Tabor, and Madame Philip Rivoire. The second prize was secured by Mr. F. King, who had fine specimens of Phœbus, Chas. Davis, and Mrs. Mease. The best dozen Japanese blooms came from Mr S. Pead, gardener to R. S. Bond, Esq., Surbiton; Mr. A. Smith, Roehampton, second. Mr. Atkins had the best six Japanese white; Mr. King had the best six of one variety, Mdlle. Thérèse Rey. For reflexed blooms Messrs. Caryer and Read scored; Mr. Forbes led for anemones, and Mr. Caryer for a dozen bunches of pompon varieties, in a close competition. Mr. Forbes had a fine stand of singles, winning with Rose Pink, Admiral Sir T. Symonds, Mrs. Walton, Crown Jewel, Miss Crissy, Charming, E. Forbes, Miss Mary Anderson, Annie Holden, Maud Robinson, and Earlswood Glory. Mr. Forbes also won a special prize for twelve incurved blooms.

His Worship the Mayor of Kingston (Alderman J. Hart, J.P.) offered a prize for the best basket of chrysanthemums, and this was won by Mr. G. W. Forbes, gardener to Madame Nicols, Surbiton, with large blooms set in coloured azalea foliage and sprays of smilax; Mr. Brett second, and Mr. Bolton third; the second prize lot best suited our taste. Mr. W. Atkins showed the best lady's spray; Miss Johnstone, Coombe Cottage, the best arrangement of cut flowers and foliage for a dinner table, a light arrangement of cypripediums and cattleyas. The best bouquet of chrysanthemums was that shown by Mrs. Hugh Macan, Richmond Villa, Kingston; Mr. W. Atkins second. For buttonhole bouquets the chief award fell to Mrs. Hugh Macan, who had very light arrangements of orchids and asparagus; Mrs. Atkins second.

FRUIT.

Mr. W. Taylor, gardener to C. Bayes, Esq., Tewkesbury Lodge, Forest Hill, had the best four dishes of dessert fruit, showing good grapes, figs, apples, and pears; Mr. G. J. Hunt, second, with a melon, grapes, pears, and plums; there were seven competitors. Mr. J. Lock showed the best six dishes of apples, three dessert and three cooking varieties, examples of King of the Pippin, Lady Henniker, Ribston Pippin, Peasgood's Nonsuch, Reinette du Canada, and Cox's Orange Pippin; Mr. Cooper, gardener to Colonel Egerton, Stud House, Hampton Court, second. Mr. A. H. Rickwood, gardener to the Dowager Lady Freake, Fulwell Park, Twickenham, led for four dishes of pears with good specimens of Duchess d'Angoulême, Beurré Superfin, Durondeau, and Pitmaston Duchess; Mr. Cooper, second. Mr. Sadler, gardener to Mrs. Fulk, Cowley House, Chertsey, secured the first prize for three bunches of black grapes with large berries—Gros Colmar; Mr. Taylor, second, with the same variety. For white grapes Mr. Taylor was first, and Mr. Brett second, each with well-finished Muscat of Alexandria.

NON-COMPETITIVE EXHIBITS.

Mr. W. Wells, Earlswood, Redhill, put a charming lot of large bunches of early-flowering chrysanthemums, the variety named Crimson Pride figuring largely. Mr. H. J. Jones, Lewisham, sent a good number of cut blooms of newer varieties, including Soleil d'Octobre, General Paquié, Yellow Mrs. Lees, R. Hooper Pearson, President Nonin, and Mrs. W. Mease shown in fine form. Messrs. G. Bunyard and Co., Maidstone, put up a splendid lot of apples, staging large dishes of fine fruits of leading varieties; all were so good that none need be particularised. Mr. S. Mortimer, Farnham, showed a splendid lot of dahlias, and an exhibit of such excellence is seldom to be seen on the first day of November. Mr. J. Miller, gardener to Lord Foley, Ruxley Lodge, Esher, sent a collection of fruits, on which the labels had got badly mixed. Messrs. J. Cheal and Sons, Crawley, also showed a good lot of pears and apples; Mr. W. Tayler, Hampton, staged hardy fruit, and Mr. W. Hayward, Kingston, sent floral arrangements of great beauty.

BRIXTON AND STREATHAM, November 2 and 3.

As in the case of some other suburban shows that of Brixton has fallen from its ancient high estate. There was a time when Kingston and Brixton were the two largest and finest of the South London chrysanthemum shows. Now, however, the show of the Brixton, Streatham, and Clapham Society is of more local interest, and judged thus it is a decided success. On some other occasions the exhibits have had to be squeezed together more than on the present. There was a good display, however, and the Japanese blooms were of special quality, both as regards size and finish. Groups and plants were also good and would not have disgraced the Aquarium. The Messrs. Peed put up a goodly non-competitive group; Mr. Roupell sent some apples and grapes; while Mr. Pearse showed a handsome lot of heaths, which made an attractive bank near the stage.

In the principal group class there was a fair competition, and the first prize, a silver cup, was won by Mr. Howe, gardener to Sir H. Tate, Streatham Hill, with the prettiest group we have so far seen this season. The plants were dwarf, and in small pots, each carrying a single flower; Mr. C. Poulton, gardener to C. T. Cayley, Esq., second. The best set of six bush specimens of Japanese chrysanthemums came from Mr. J. Weston, gardener to Dr. Martineau, Clapham Park; Mr. Gidney, gardener to Major Saunders, coming second. Mr. Mursell, gardener to Mrs. Burton, Leigham Court Road, led the way for primulas with eight large specimens of single varieties; for double forms Mr. J. Jones was easily first. Mr. Gilks, gardener to A. Morris, Esq., had the best cyclamen, but these were not of special merit. Mr. Ransome, gardener to J. T. Gabriel, Esq., Roupell Park, showed the best half-dozen orchids—Cattleya labiata, Vanda cærulea, Cattleya Bowringiana, and Oncidium varicosum; Mr. J. Jones, second. Mr. Fulbrook, gardener to B. B. Baker, Esq., Roupell Park, showed the best specimen orchid, a good Cattleya labiata; the same competitor was also first for three orchids.

Mr. Poulton was first for six untrained specimens of Japanese chrysanthemums, with a pair each of Phœbus and J. Shrimpton, the latter grand plants, though not large; Viviand Morel and Souvenir de Petite Ami. Mr. Gruyett, gardener to Mrs. Gabriel, secured the Messrs. Toogood's prize for four ferns, putting up good specimens of davallias and gymnogrammas; Mr. J. Jones, gardener to N. N. Sherwood, Esq., coming a good second, and showing a first-rate Adiantum Farleyense. Mr. Gilks put up the best three trained chrysanthemums, having large and freely flowered plants of J. Shrimpton, Emily Silsbury, and Bessie Chapman. Mr. Chalk, gardener to A. Norman, Esq , Longdon, Streatham Hill, secured the leading award for four foliage plants, showing a big Kentia, Anthurium crystallinum, and a pair of crotons; Mr. Howe had to be content with second place.

In the principal class for cut flowers, that for two dozen Japanese, Mr. Howe was again successful, putting up a splendid stand of the following varieties: Mrs. H. Weeks, Lady Hanham, Australie, Lady Ridgeway, Lord Justice Lopes, Colonel W. B. Smith, Viviand Morel, and Ella Curtis; Madame de la Rochetiere, R. Powell, Mrs. E. G. Hill, Edith Tabor, M. Chenon de Leche, Souvenir de Madame Rosetti, Madame P. Rivioire, and Mrs. G. W. Palmer; Mons. Panckoucke, Beauty of Teignmouth, Mrs. Maling Grant, E. Molyneux, Mrs. F. A. Bevan, Pride of Maidenhead, President Nonin, and Directeur Seebert; Mr. Poulton, second; and Mr. Mursell, third. In a special class for twelve Japanese blooms Mr. Andrews was first. Mr. Howe had the best half dozen Japanese blooms one variety, showing Phœbus in fine colour. Mr. Banks, gardener to J. C. Covell, Esq., Tulse Hill, won the first prize for a dozen Japanese blooms, single-handed gardener class, and also secured the Ryecroft silver medal with good flowers of Viviand Morel, Madame Carnot, Reine d'Angleterre, Modesto, President Borel, Charles Davis, Dorothy Seward, Mrs. H. Payne, Mrs. J. Lewin, Lady Hanham, Edith Tabor, and Colonel W. B. Smith; Mr. Farrow, gardener to G. B Peerless, Esq , Clapham Road, second.

Only one competitor came forward in the class for two dozen incurved blooms, and this was Mr. Howe, who was awarded first prize for the following: J. Agate, Prince Alfred, Mdme. Ferlat, Lord Wolseley, Globe d'Or, Duchess of Fife, C. H. Curtis, M. R. Bahaunt, Jeanne d'Arc, Lady Isabel, Mdme. Darrier, Aristene Anderson, Incogniti, R. Petfield, D. B. Crane, Baron Hirsch, and Brookleigh Gem, with duplicates to make up the number. Mr. Hill, gardener to G. W. Ryder, Esq., Streatham Hill, secured first prize for twelve incurved with good examples of C. R. Kingston, Globe d'Or, Mdme. Darrier, M. R. Bahaunt, C. H. Curtis, Lord Wolseley, Prince of Wales, Beverley, Refulgens, M. A. Haggas, Brookleigh Gem, and Baron Hirsch. The best six incurved blooms, one variety, were of C. H. Curtis, shown by Mr. Howe; Mr. Hill second with Baron Hirsch. Mr. Weston gained first prize for a pretty lot of pompon varieties. The best dozen blooms of broad-petalled, incurved Japanese varieties were shown by Mr. Howe, who set up fine flowers of Mrs. Dewar, N. C. S. Jubilee, Beauty of Teignmouth, Australie, E. Molyneux, Pres. Nonin, Lady Ridgeway, Lord Justice Lopes, R. Powell, Louise, and Mdme. F. Rosetti; Mr. Poulton second in a good competition. For six Japanese blooms Mr. Banks was first, and Mr. W. Smith, gardener to Rev. S. M. Ranson, Streatham Park, second, both showing well. In a duplicate class Mr. Milson, gardener to J. Stoddart, Esq., Tulse Hill, won first place for twelve Japanese blooms, his set containing specially fine C. Davis, Mrs. W. Mease, and M. de la Rochetiere; Mr. J. Young second. Messrs. Poulton and Mursell divided the honours for a dozen cut blooms staged on long stems with their natural foliage attached. This class made a good show and was rather novel.

Baskets of chrysanthemums were very pretty, and the first prize was well won by Miss Crook, Palace Road, Streatham Hill; Miss Whitford, Bronton Hill, second, with a handsome lot of rosy flowers.

Mr. Howe had the best three bunches of black grapes, showing good Alicante; Mr. Milsom second. For white grapes the order was reversed, both exhibitors staging Muscat of Alexandria. Mr. Vince showed the best apples, and Mr. Young, gardener to Dr. A. Stevens, Tulse Hill, the best pears. Mr. Mursell staged the best Black Hamburgh grapes. Mr. Poulton won Lady Tate's special prize for a collection of vegetables, putting up a grand lot of produce; Mr. Howe second.

CROYDON CHRYSANTHEMUM SOCIETY, November 1 and 2.

THE eleventh annual exhibition of this enterprising society, which was held at the Public Halls on the above dates, was a conspicuous success. The cut blooms were noticeable for high quality and freshness, and in most classes there was a spirited competition, the best contested being that for the Cup, which was awarded to Mr. Mills, gardener to Frank Lloyd, Esq., who was also the successful exhibitor last year. There was a splendid display of fruit and also of vegetables, the cottagers contributing largely to the last-named. The general arrangements, in the hands of the courteous secretary, Mr. W. B. Beckett, were satisfactory.

CUT BLOOMS were shown in great numbers, and were for the most part of good substance and quality. The Challenge Cup brought a most spirited competition, no less than eight exhibitors staging blooms of great merit. The Cup, of the value of £25, is offered for three dozen Japanese blooms, and the award was made in favour of the winner of the last year's competition, Mr. M. Mills, gardener to Frank Lloyd, Esq., Coombe House, Croydon, who staged grand flowers of G. C. Schwabe, Australie, Edith Tabor, M. Panckoucke, Sunflower, Miss Elsie Teichmann, Mme. Gustave Henry, Oceana, Edwin Molyneux, John Seward (2), Mutual Friend (2), Louise (2), Joseph Brookes, Phœbus, Mons. Chenon de Leche, Mme. G. Bruant, Mrs. G. W. Palmer, Emily Silsbury (2), Royal Standard, Lady Byron (2), Graphic (2), President Borel, and Charles Davis. This was a fine exhibit, and well deserved the award. Mr. H. Paddon, gardener to Colonel Ricardo, Bramley Park, Guildford, was a good second; and Mr. W. King, gardener to J. Colman, Esq , Gatton Park, Reigate, third.

In the open classes Mr. H Paddon headed the four exhibitors of eighteen incurved in not less than twelve distinct varieties, with fine blooms of Mrs. R. C. Kingston, Baron Hirsch, Princess of Wales, M. R. Bahaunt, Miss V. Foster, D. B Crane, Globe d'Or, Golden Nugget, Austin Cannell, Lucy Kendall, Empress of India, and Lord Wolseley; Mr. W. King was second; and Mr. C. Lane, gardener to E. H. Coles, Esq., Caterham, third. Mr. Mills was awarded the first prize for twelve Japanese, white, showing splendid flowers of Emily Silsbury, Mutual Friend, Madame A. D. Galbert, and Elsie Teichmann. Mr. Lane was the only exhibitor of twelve yellow incurved, and was awarded the second prize.

In the local classes Mr. E. Mills was first for eighteen Japanese, in not less than a dozen varieties, with well developed blooms of Edith Tabor, Edwin Molyneux, Sunflower, Mutual Friend, W. Seward, and Louise; Mr. G. Prabble, gardener to M. Hodgson, Esq., Shirley, was a close second; and Mr. R. Gladwell, gardener to Sydney Smith, Esq., South Norwood, third. Mr. J. Munro, gardener to J. L. Bucknall, Esq., Langley Court, Beckenham, was first for twelve incurved, staging Mrs. J. Kearn, Lord Alcester, Madame Darrier, Lord Wolseley, Queen of England, Golden Beverley, Baron Hirsch, Jeanne d'Arc, Globe d'Or, C. H. Curtis, Miss Violet Tomlin, and Brookleigh Gem; Messrs. Prabble and Dyer were second and third respectively. Mr. Mills gained premier honours for twelve Japanese blooms in four varieties.

The classes open to single-handed gardeners and amateurs were well contested. Messrs. W. Habben, J. G. Mills, and Osmond were the prize takers for six incurved blooms; Mr. A. Dyer was first for six bunches of pompons, showing Perle des Beautés, Mdme. Martha, Mdme. E. Dordon, Prince of Orange, Black Douglas, and Golden Mdme. Martha; and Mr. H. Green gained a similar honour for his exhibit of six Japanese.

GROUPS AND PLANTS were well shown, and the arrangement of the former in the centre of the hall, instead of as in former years against the wall, was a decided improvement. In the open classes, Mr. E. Dove, gardener to H. E. Fry, Esq., Bickley Hall, was a well-deserved first for a group of chrysanthemums arranged on a space of thirty-five superficial feet. The blooms were of large size and well contrasted as to colour. Mr. C. Lane was second with plants not quite so finely flowered, and Mr. C. Padley, Southbridge Road Nurseries, was third. Mr. J. Slater was first for six plants, and Messrs. Lane and Mills were first and second respectively for nine plants suitable for table decoration. Mr. G. Eales, gardener to J. Glaisher, Esq., was second for six primulas. Mr. Slater was first for six plants of single varieties, which were well-flowered and very effective.

In the class open to single-handed gardeners for a group of miscellaneous plants arranged on a space of thirty-five feet, Mr. G. Eales headed the four competitors with a tasteful group; Messrs. Dyer and Purnell were second and third.

FRUIT.—Apples and pears were staged in great abundance, and the fine quality was much commented upon. Grapes were also plentifully shown, but were of poor quality. In the open classes Mr. W. E. Humphreys gained the premier honours for a collection of twelve dishes of apples, in which were grand samples of King of the Pippins, Cox's Orange Pippin, Remborough, dessert; and Blenheim Orange, Mère de Ménage, and Bramley's Seedling, kitchen; Mr. J. Harris was a close second; and Mr. W. Jones, third. Mr. Linton, gardener to W. Greenwell, Esq., Marden Park, was first for four bunches of grapes, showing Black Alicante and Muscat of Alexandria; and Messrs. Dingwall and Tilbey were second and third respectively.

In the local classes Mr. C. Jordan, gardener to H. Hoskier, Esq., Coney Hill, Wickham, headed the eight exhibitors of six dishes of dessert pears with splendid samples, Beurré Superfin and Magnate being especially good; Mr. W. E. Humphreys, gardener to A. H. Smee, Esq., Hackbridge, was a good second; and Mr. W. Jones, gardener to J. R. Brougham, Esq., Wallington Bridge, third. Mr. O. Jeal, gardener to N. Waterall, Esq., Waddon Lodge, gained premier honours for six dishes of dessert apples, staging King of the Pippins and Cox's Orange Pippin in fine condition. The second prize was awarded to Mr. W. Jones, who also gained the first prize for six dishes of kitchen apples, his best fruits being Blenheim Orange and Emperor Alexander; Mr. W. E. Humphreys was a very close second, and Mr. J. Harris, gardener to P. Crowley, Esq., Waddon, third. Five competitors staged two bunches of white grapes. Mr. W. R. Clarke, gardener to J. Densham, Esq., was first with good bunches of White Tokay; and Mr. J. Dingwall, gardener to W. F. Stanley, second. Mr. W. R. Clarke headed the seven competitors for two bunches of black grapes, showing Black Alicante; Mr. Dingwall was second.

VEGETABLES were shown in great quantities, and the quality was for the most part excellent. Mr. O. Jeal was first for six dishes of potatos with fine tubers of Early Puritan, Abundance, Satisfaction, and Windsor Castle; Mr. E. Mills was second, and Mr. T. H. Hill third. For a collection of twelve varieties the awards were made in favour of Messrs. A. Hornsby, Robinson, and Johnson.

Miscellaneous exhibits were plentiful, and contributed in a great degree to the success of the exhibition. Messrs. J. Laing and Sons, Forest Hill, in addition to staging a number of dishes of apples, decorated the entrance hall and stage in a very tasteful manner. Messrs. J. Peed and Sons, Roupell Park Nurseries, J. Cheal and Sons, Crawley, and J. R. Box, West Croydon, contributed representative collections of apples; and floral designs were sent by Mr. Henry Anstey, West Norwood, and Mr. J. Williams, Oxford Road, Ealing. The Agricultural and Horticultural Association (Limited) and Mr. E. S. Rogers, Croydon, had stands of horticultural sundries, and a pretty contribution was that from Messrs. Stanley Mobbs and Ashton, who sent finely-flowered plants of Lælia pumila.

EASTBOURNE HORTICULTURAL SOCIETY, November 1 and 2.

THE annual chrysanthemum exhibition was held in the spacious Floral Hall of Devonshire Park on the above date, and a better place could not be selected for the purpose of a November show. It is a miniature Crystal Palace; a portion of the roof is shaded, which tempers the light from above, but there is abundance of side light. The secretary, Mr. E. A. Newman, and his staff of assistants arranged the exhibits in an admirable manner.

MISCELLANEOUS EXHIBITS found a place round the sides of the hall. A fine and striking group of chrysanthemums and foliage plants came from Mr. May, The Gardens, Compton Place, Eastbourne. The platform was lavishly embellished by Mr. G. T. Scott, nurseryman, Eastbourne, with excellent chrysanthemums and other plants; Mr. T. D. Young, another nurseryman in the town, filled the west end of the hall with a large collection of plants; Mr. F. G. Miller, also a local florist, had a choice collection; and Mr. W. Wells, of Earlswood, had a collection of the newer varieties of Japanese chrysanthemums and charming bunches in vases of his new decorative varieties. Certificates of merit were awarded to Mrs. White Popham and President Bevan among the Japanese, and to Crimson Pride and Mychett Yellow among the decorative types.

GROUPS.—Some good groups of plants were shown in the various divisions. The best in the one open to all came from Mr. W. Jupp, gardener to G. Boulton, Esq., Eastbourne, showy and well arranged; Mr. J. Gore, Polegate, was second. Mr. Gore had the best group of flowering and foliaged plants mixed, Begonia Gloire de Lorraine being a telling subject; and Mr. Jupp was second. In the amateurs' division Mr. F. Williams, Eastbourne, had an excellent collection of plants, finely grown and bloomed; Mr. C. Hibbert was second. In another division Mr. Pattender, gardener to Miss Wilson, Eastbourne, was first; and Mr. E. S. Reid, gardener to the Rev. E. W. Foley, Eastbourne, second.

CUT BLOOMS.—In the open division cut flower classes Mr. J. Stredwick, Silverhill, St. Leonards, was first, with twenty-four Japanese, having excellent flowers, chief among them being Graphic, Eva Knowles, Edith Tabor, Pride of Madford, Charles Davis, Madame G. Henry, Australian Gold, and President Nonin. Mr. Stredwick also had the best twelve; and Mr. J. Harwood, gardener to A. J. Jack, Esq., Seaford, was second. The latter was first with six blooms of one variety, white, having Simplicity in fine form. The best six blooms of any other colour were those of the yellow Oceana, from Mr. Harwood; Mr. A. Emery, gardener to H. Oakley, Esq., coming second, with well-coloured E. Molyneux. In another division Mr. E. East, gardener to Mrs. Ray, Meads, was first for Japanese, Mr. W. Jupp being second.

Incurved varieties were scarce, and those staged were not fully developed. Mr. A. Emery had the best six varieties, chief among them being Madame Darrier and Baron Hirsch; Mr. G. Holding, gardener to the Rev. H. Shortland, Mill Gap, was second.

Dinner tables arranged with chrysanthemums and other flowers were highly effective; and there were vases of six blooms of chrysanthemums which were very effective.

There was a good display of fruit, and especially of apples and pears. Mr. Camm, gardener to the Duchess of Cleveland, Battle Abbey, was first with three bunches of black grapes, having finely-finished Alicante; Mr. Gore was second, with good Gros Colmar. Mr. Camm's three bunches of Muscat of Alexandria were grandly finished, and really splendid in colour. Culinary and dessert apples, stewing and dessert pears, were numerously and well shown.

NATIONAL CHRYSANTHEMUM SOCIETY, October 31.

A MEETING of the Floral Committee of this society was held at the Royal Aquarium on Monday, when the novelties submitted formed an interesting and attractive display. The principal exhibitors on this occasion were Messrs. H. Cannell and Sons, Swanley; Mr. W. J. Godfrey, Exmouth; Mr. H. J. Jones, Ryecroft Nursery, Lewisham; Mr. N. Molyneux, Rookesbury Park; Mr. H. Weeks, Thrumpton Hall, Derby; and Mr. Wells, Earlswood, all of whom presented, in good form, novelties of much merit.

The following certificates of the first class were awarded: to Mr. W. J. Godfrey for *Mrs. W. Mease*, the beautiful primrose-yellow sport from Madame Carnot, shown for the first time last year by Mr. W. Mease, by whom it was fixed; the blooms shown were splendidly developed, and fully justified the high opinion entertained of the variety when first presented to public notice. To Mr. W. Wells for *Nellie Pockett*, a distinct Japanese with medium sized solid blooms, having narrow florets that are cream-white with greenish centre in the earlier stages of development. *Mrs. White Popham*, a large incurving Japanese, the blooms solid and the colour deep pink—should become popular for exhibition; and *Mychett Yellow*, a remarkably good decorative variety of neat habit and free blooming; the flowers are of medium size and the colour rich yellow. To Mr. Robert Owen, Maidenhead, for *Sir Herbert Kitchener*, a pleasing Japanese, the blooms rather large with long drooping florets of a rich golden chestnut hue. To Mr. H. J. Jones for *R. Hooper Pearson*, a superb Japanese, the blooms large and solid, with broad somewhat drooping florets turned up at the tips, the colour rich golden yellow; fine for middle and back rows; and *Ryecroft Scarlet*, a neat dwarf-growing decorative variety with medium sized flowers of a brilliant crimson hue and of much value for decorations in a cut state. To Mr. H. Weeks, for *Emily Towers*, an incurved Japanese, the blooms large, massive, and of a rich rose-pink hue. *Lady Crawshaw*, an exquisitely beautiful Japanese, the blooms large and massive and with long slightly drooping florets, cream-white, centre florets tipped rose; *Mrs. Coombe*, a superb Japanese, the blooms of the largest size, solid and finely finished, the colour deep rose; and *Henry Weeks*, a noble flower, similar in character to M. Chenon de Leche, from which it has been raised, the florets bright crimson with golden reverse. To Mr. N. Molyneux, for *John Miles*, an incurved, remarkable as shown for its high finish; the blooms are of medium size with broad, stout rounded florets, solid, and the colour is a pleasing shade of orange-buff.

In Messrs. H. Cannell and Sons' collection we made note of the promising Topaze Orientale, a distinct incurved, the blooms large and of a pale yellow hue, and Purple Emperor, a beautiful Japanese, the blooms of medium size and of a rich purple hue, not large enough for exhibition but of immense value for the conservatory. Mr. Seward, Hanwell, had several seedlings, but they were not sufficiently developed.

SOUTHAMPTON, November 1 and 2.

THE annual show was held in the Victoria Hall on the above date, and was in every way a success. Mr. Fuidge, as usual, carried out the secretarial arrangements in an efficient manner.

CUT BLOOMS were the most interesting feature, judging from the crowds who surrounded the stands during the day. For twenty-four Japanese Mr. H. N. Mose, Belmont Nursery, Sholing, was an easy first with clean, medium-sized specimens; the following were the most noteworthy varieties—Edith Tabor, Edwin Molyneux, N.C.S. Jubilee, Phœbus, Modesto, President Nonin, Pride of Exmouth, Duke of Wellington, Lady Hanham, and M. Panckoucke; Mr. Bowerman, gardener to Mrs. C. Hoare, Hackwood Park, Basingstoke, was a good second; Mr. G. Nobbs, gardener to Her Majesty the Queen, Osborne, third. In the class for eighteen Japanese, distinct, Mr. Bowerman gained premier honours with a stand of good blooms; Mr. Nobbs was second with creditable examples. For twelve Japanese Mr. Nobbs won easily with medium-sized, bright-coloured specimens; the second place was occupied by Mr. West, gardener to R. Wigram, Esq., Northlands, Salisbury. Mr. Goss, gardener to W. G. Roy, Esq., Marchwood, with twelve blooms in eight varieties, won premier place in the Japanese section with heavy and bright specimens; Mr. Nobbs followed closely. Japanese, white and yellow, in six blooms, were well represented. Mr. L. Dawes, gardener to Mrs. Ogilvie, Hambledon, won with representative blooms of Phœbus and Australian Gold.

Incurved blooms were poor. In the amateur division the flowers were of exceptionally good quality. In the classes for both twelve and six blooms Mr. H. H. Lees, 54, Cedar Road, The Avenue, Southampton, gained the premier award with grandly-developed specimens of Mrs. Weeks, Mutual Friend, Pride of Exmouth, Edith Tabor, and Pride of Madford; Mr. E. Brown, jun., Hill Lane, Southampton, second.

PLANTS were of average quality, excepting in the chrysanthemum groups, in which there was really a creditable display. Mr. Bain, gardener to Mrs. Dickson, Shirley, secured the coveted award with plants dwarf in growth, freely-bloomed, and well arranged; Mr. Hossy, gardener to C. D'Esterre, Esq., Elmfield Hill, second. For a group of chrysanthemums and foliage plants, Mr. Amys, gardener to Mrs. Elliott Yorke, Netley, was distinctly ahead of all others with a pleasing arrangement; Mr. T. Hall, gardener to Sir S. Montagu, Bart., South Stoneham House, second.

FRUIT AND VEGETABLES were well staged. Mr. Mitchell, gardener to J. Willis Fleming, Esq., North Stoneham, was first for three bunches of grapes, distinct, as well as for Muscats; Messrs. Sanders and Hall following.

Non-competitive exhibits added to the beauty of the show. Foremost was Messrs. E. Hillier and Son's grand display of apples. Mr. Rogers, Red Lodge Nursery, sent an interesting collection of shrubs and trees, and Mr. Bailey a choice assortment of wreaths, &c.

KENT COUNTY, November 2 and 3.

As usual, the Kent County Society held its annual Chrysanthemum Show, the eleventh, in the Skating Rink, Blackheath. It was a pretty show, and, if not quite so large as sometimes, there were a large number of first-class flowers to be seen and good quality generally. All arrangements were well carried out and up to time. It is to be hoped the wet weather of the first day did not spoil the "gate."

Four chrysanthemum groups were staged, each occupying a space of fifty square feet. These were a great attraction to the show, and the best was that from Mr. E. Dove, gardener to H. E. Fry, Esq., Bickley Hall, Kent; Mr. A. W. Hollands, Lee, second; and the Messrs. Pollard Brothers, Lee, third, with a very dwarf lot of plants. The first prize for a group of flowering and foliage plants was easily won by Mr. J. Lyne, gardener to H. Tiarks, Esq., Foxbury, Chislehurst. He had a splendid lot of crotons, cattleyas, Clerodendron fallax, calanthes, Dendrobium phalænopsis, aralias, &c., all well arranged as regards colour, but rather too closely staged. The second prize was withheld, and the third was awarded to a group that apparently had no owner. Mr. Lyne was a successful exhibitor of table plants.

The first prize for thirty-six blooms, half incurved and half Japanese, together with the Ryecroft silver gilt medal, was won by Mr. J. Robinson, gardener to W. Lawrence, Esq., J.P., Elsfield House, Hollingbourne, who had an altogether fine lot of flowers. His Japanese varieties were Pride of Madford, Madame Gustave Henry, Miss Ella Curtis, W. Wright, Mrs. J. Lewis, and Eva Knowles; Mrs. Weeks, J. Seward, J. Bidencope, Mons. Panckoucke, Australie, and Simplicity; N. C. S. Jubilee, Madame Bergier, Sécrêtaire Fierens, Madame Carnot, Mons. G. Biron, and Soleil d'Octobre; the incurved were Yvonne Desblanc, Miss V. Foster, J. Lambert, Mons. Bahaunt, Leonard Hayes, and Ma Perfection; Queen of England, Miss Haggas, A. Salter, J. Kearns, Topaze Orientale, and Lord Wolseley; C. H. Curtis, Mrs. J. Murray, Golden Empress, Globe d'Or, Empress of India, and Golden Nugget. There were four exhibitors, the second prize falling to Mr. C. Payne, gardener to C. J. Whittington, Esq., Elmhurst, Bexley Park; Mr. J. E. Poole, gardener to A. G. Hubbuck, Esq., Elmstead Lodge, Chislehurst, third. The president's prize for two dozen blooms, eight Japanese, eight incurved, and eight reflexed, was well won by Mr. J. Lyne, gardener to H. F. Tiarks, Esq., Foxbury, Chislehurst, who staged Mrs. H. Weeks, Robert Powell, Australie, Madame Carnot, W. Tucker, Beauty of Exmouth, Mrs. C. H. Payne, and Australian Gold as Japanese; Mrs. J. Murray, C. H. Curtis, Duchess of Fife, V. Tomlin, Globe d'Or, Mrs. Colman, Princess of Wales, and Madame Darrier as incurved; and Dorothy Gibson, King of Crimsons, Amy Furze, Clara Jeal, R. Smith, Chevalier Domage, Cloth of Gold, and Florence Lunn as reflexed; Mr. J. E. Poole second. The best dozen blooms of the Rundell family were those shown by Mr. C. Russell, gardener to T. Pim, Esq., Marten's Grove, Crayford, who staged four blooms each of George Glenny, Mr. Rundle, and Mrs. Dixon; Mr. Poole second, and Mr. Lees third. Mr. Russell had the best dozen anemones, Descartes and Judge Benedict being very good; Mr. Lyne second. The best Japanese bloom in the show was Mrs. H. Weeks, shown by Mr. Lyne. The best incurved was Mrs. J. Murray, shown by Mr. C. Payne.

The leading award for two dozen Japanese blooms was secured by Mr. H. Hurst, gardener to W. T. Holland, Esq., The Gables, Bexley, who showed very good specimens, clean and fresh, of Simplicity, R. Powell, Pride of Exmouth, Eva Knowles, Lady Byron, Reine d'Angleterre, Mrs. G. W. Palmer, and Australie; James Bidencope, Viviand Morel, Sunflower, Père Franoun, E. Molyneux, C. Davis, Madame Gustave Henry, and Lady Ridgeway; Duke of Wellington, Mdlle. T. Rey, N.C.S. Jubilee, G. C. Schwabe, Hairy Wonder, Eda Prass, Phœbus, and Matthew Hodgson; Mr. J. Blackburn, gardener to J. Scott, Esq., Elmstead Grange, Chislehurst, second; and Mr. C. Dann, Maidstone, third. For a dozen incurved blooms Mr. T. Osman, gardener to T. J. Baker, Esq., Ottershaw Park, Chertsey, was first with C. H. Curtis, Queen of England, Golden Beverley, Prince Alfred, Madame Darrier, Brookleigh Gem, Jeanne d'Arc, Lady Hardinge, D. B. Crane, M. Bahaunt, Globe d'Or, and Empress of India; Mr. Lyne second; the flowers were not very good in this class. Six fine flowers of Colonel W. B. Smith won first prize in the class for six of one variety for Mr. C. Dann; Mr. Osman second with Madame Ricoud. The six best white Japanese, one variety, were Mutual Friend, shown by Mr. T. Osman; Mr. Spink, gardener to H. B. Hohler, Esq., Fawkham Manor, Kent, second with Lady Byron. For twelve Japanese blooms Mr. Hurst secured the chief award from seven competitors with fresh and bright blooms of J. Seward, Lady Byron, R. Powell, Australie, Viviand Morel, Mrs. G. W. Palmer, Madame Gustave Henry, C. Davis, James Bidencope, N.C.S. Jubilee, Sunflower, and G. C. Schwabe; Mr. J. Lyne second, and Mr. C. Dann third. The best six incurved, one variety, were Mr. Russell's blooms of Baron Hirsch, well finished and bright; Mr. Lyne second with Jeanne d'Arc. In the smaller classes the leading prize winners were Mr. J. Cartwright, Lewisham; Mr. F. Shepley, Brockley; and Miss de Quincy, Chislehurst.

Miss M. Davis secured the leading award for a bouquet with a charming arrangement, Mrs. Hollands being first for an epergne.

Mr. W. Taylor, gardener to C. Bayer, Esq., Tewkesbury Lodge, won first prize for white and second for black grapes; Mr. Lyne was first for black grapes with Alicante. Mr. Dann was a successful exhibitor of apples, and Mr. C. Jordan had the best pears.

A few miscellaneous exhibits helped the display. Messrs. J. Laing and Sons decorated the platform, and put up a comprehensive and well-grown lot of fruit. Messrs. Bunyard and Co., Maidstone, sent a goodly lot of apples and pears. Mr. H. J. Jones, Lewisham, had a pretty table of chrysanthemum blooms, newer varieties, on long stalks, these being associated with Begonia Gloire de Lorraine, palms and ferns. Mr. J. Carvill showed a pretty little set of cattleya blooms, notably of C. Harrisonæ.

HERTFORD HORTICULTURAL ASSOCIATION,

November 2 and 3.

THE exhibition held by this enterprising society was of so high a degree of excellence as to deserve kinder treatment from the weather than was meted out on the opening day. Within the Corn Exchange there was a brilliant display of colour, without the weather was dull and wet; yet, when the exhibition was opened by Lady Faudel Phillips, there was a large gathering of members and others to assist at the function. With the exception of the vegetables, the exhibition was of larger extent than any previous exhibition held in the town, and the falling off in the vegetable classes was wholly due to the drought.

CUT BLOOMS constituted a large and immensely attractive feature, for the entries were numerous and the quality of the blooms was for the season remarkably high. There were five entries in the great class for twenty-four Japanese blooms, distinct, and the premier award was made in favour of Mr. W. Ring, gardener to J. Warren, Esq., Capel House, Waltham Cross, who had exceptionally fine blooms of Mrs. W. Mease, Mrs. C. H. Payne, Madame Carnot, Pride of Madford, Baron de Rothschild, G. J. Warren, Viviand Morel, Madame G. Henry, Queen of Buffs, W. Newitt, Charles Shrimpton, Phœbus, G. C. Schwabe, Mons. Biron, Souvenir de Petite Amie, Edith Tabor, J. Myers, Pallanza, Louise, William Tricker, Madame M. Ricoud, Mrs. C. Blick, Robert Powell, and Eva Knowles; Mr. Collins, gardener to J. W. Carlile, Esq., Ponsbourne Park, Hertford, was a very close second with an excellent collection, which included a magnificent example of Phœbus, which was selected as the premier Japanese in the show; Mr. Cox, gardener to John Trotter, Esq., Brickendon Grange, Hertford, was third, with heavy blooms. In competition for the prizes for twenty-four incurved Mr. Collins was an easy first with good blooms of Globe d'Or, C. H. Curtis, Violet Foster, Princess of Wales, Prince Alfred, M. P. Martignac, and Baron Hirsch, the last-named being selected as the premier incurved. There was only one stand of twelve incurved, and the premier award was made in favour of Mr. Turk. In the corresponding class for Japanese there was a keen competition, and the prizes were awarded to Mr. Collins, Mr. Ring, and Mr. Cox, all of whom had good stands, in the order of their names. Mr. Turk, and Mr. Caterer, gardener to T. Usher, Esq., Elmsfield, Hertford, were first and second for twelve reflexed. The class for six blooms of one variety of Japanese staged in vases with eighteen inches of stem was an exceptionally good one, and Mr. F. Clark, gardener to J. H. Johnson, Esq., Little Berkhamstead, was first with finely-developed blooms of Mdme. M. Ricoud; Mr. Luff, gardener to H. Barclay, Esq., Little Berkhamstead, was second with good blooms of Phœbus; and Mr. Cox was third with Mrs. G. W. Palmer. In the class for six blooms, distinct, of Japanese, to be shown in a vase and with eighteen inches of stem, Mr. G. Clark, York Road, Hitchin; Mr. Durrant, Ware; and Mr. Douglas Garrett, Hertford, were the prizetakers in the order of their names, with blooms differing but little in relative merit. The entries to the vase classes formed a very pleasing feature, and fully justified the position the classes had in the schedule.

GROUPS arranged for effect were equal to the high average of previous years. The premier group of chrysanthemums was contributed by Mr. E. H. Caterer, who had a neat and effective arrangement, remarkable for the high quality of the blooms and the ample development of the leafage. Mr. W. Ring was second with an excellent collection, but the effect was somewhat marred by the obtrusive stakes; Mr. F. Clark third. In the competition for the prizes for small groups of chrysanthemums the first and second awards were made in favour of Mr. G. Peacock, Mangrove Hall, Hertford, and Mr. J. Hornett, Bengeo, both of whom had attractive arrangements. Groups of miscellaneous plants were of exceptional merit, and the post of honour was occupied by Mr. O. Catling, gardener to W. C. Baker, Esq., Bayfordbury, with an arrangement in which bouvardias, tuberoses, crotons, palms, and nerines were tastefully disposed in an undergrowth of maidenhair ferns. Mr. Turk and Mr. Caterer followed closely for second and third place with tasteful arrangements.

MISCELLANEOUS PLANTS, including zonal pelargoniums, primulas, cyclamen, and table plants, were well represented, but it must suffice to say that the most successful exhibitors of these were Mr. J. Ryder, Mr. J. Turk, Mr. W. Collins, Mr. Luff, and Mr. O. Catling.

FRUIT formed a large and most interesting feature. There was a strong competition in the class for six dishes of pears, and Mr. A. Willsher, gardener to the Rev. E. W. Kirkby, The Vicarage, Ware, was first, with finely-finished fruit of Marie Benoist, Doyenne du Comice, Pitmaston Duchess, Duchesse d'Angoulême, and other well-known varieties; Mr. G. Fulford, gardener to R. Walter, Esq., The Priory, Ware, was a close second in this class. The first prizes in the classes for six dishes of dessert apples and for six dishes of kitchen apples were awarded to Mr. R. Gunter, gardener to G. Pearson, Esq., Brickendon, who in each class had fruit remarkable for its large size and high colour; Mr. G. Fulford was second in each class with highly creditable collections. Mr. Ryder and Mr. G. Fulford, gardener to A. G. Sanderson, Presdales, Ware, were first and second for black grapes, with superb clusters of Alicante; and in the class for white grapes Mr. O. Catlin was first, with highly-coloured examples of Muscat of Alexandria, and Mr. J. Ryder was second, with Mrs. Pearson in capital condition.

VEGETABLES were largely shown and, on the whole, of high quality, onions and potatos being exceptionally good. There was a keen competition in the class for six kinds, and Mr. Catling and Mr. Cox were first and second respectively.

LADYWELL AND LEWISHAM.

THE Ladywell, Lewisham, and District Cottagers' Horticultural Society held its fifteenth annual dinner at the Parish Church Hall, Ladywell, on Thursday, October 27. Mr. T. W. Sanders took the chair, being supported by Mr. T. White as vice-chairman, and Mr. A. Pratt, the secretary. Other gentlemen present, who took part in the proceedings, were: Mr. Harman Payne, Mr. H. J. Jones, Mr. Leonard Brown, Mr. G. Hayward, &c. The prizes, consisting of medals, cash, certificates, &c., were presented to the winners by Mrs. Bickersteth, wife of the vicar of Lewisham. There was a large gathering of members and friends, and the proceedings were of the heartiest nature.

MARKETS.

Covent Garden.

THERE continues to be a steady and good demand for both vegetables and fruits, and as these are not supplied in excessive quantities a clearance is readily effected at fair rates. Green vegetables are becoming dearer, consequently there is an improving request for potatos. Choice cut flowers meet a good demand.

FRUIT.—English apples, 4s. to 9s. per bushel; Nova Scotian, 12s. to 22s. per barrel; English grapes, 9d. to 2s.; Channel Island, 6d. to 1s. per lb.; Almeria, 8s. to 16s. per barrel; lemons, 15s. to 24s. per box; Californian pears, 4s. to 6s. 6d. per half-case; French Duchesse, 2s. 6d. to 4s. per case. 6s. to 10s. 6d. per crate; blackberries, 1s. 3d. to 1s. 9d. per peck; pineapples, 2s. to 5s. each; bananas, 5s. to 9s. per bunch; green figs, 1s. to 1s. 6d.; peaches, 2s. to 8s. per dozen; pomegranates, 4s. to 6s.; Spanish melons, 4s. 6d. to 6s.; oranges, 10s. to 20s. per case; English tomatos, 3s. 6d. to 4s. 6d.; Channel Island, 2s. 6d. to 3s. 6d. per 12 lb.; French, 2s. 6d. to 3s. 6d. per crate; English walnuts, 3s. to 4s. per bushel; French, 10s. to 13s. per 50 kilos bag.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; chrysanthemums, white, 1s. to 3s.; eucharis, 3s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 5s. to 8s.; tea roses, 6d. to 1s.; pink roses, 3s. to 4s.; red roses, 1s. to 2s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, coloured, 6s. to 9s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Celery, 9s. to 12s. per dozen rolls; Brussels sprouts, 2s. 6d. to 3s. per half-sieve; mushrooms, 2s. to 3s. per peck; cabbages, 3s. to 8s. per tally; parsley, 1s. 6d. to 2s.; leeks, 1s. 6d. to 2s.; turnips, 2s. 6d. to 3s. 6d.; carrots, 2s. to 3s. per dozen bunches; cauliflowers, 1s. to 2s.; endive, 1s. to 1s. 9d.; cucumbers, 2s. to 4s.; artichokes, 2s. to 2s. 6d.; French lettuce, 9d. to 1s. 3d. per dozen; Valencia onions, 6s. 6d. to 7s. 6d.; Ports, 5s. 6d. to 6s. 6d. per case; Dutch, 3s. 6d. to 4s. per bag; eschallots, 1s. 6d. to 2s.; spinach, 2s. to 3s. per bushel; potatos, 55s. to 90s. per ton.

Borough Potato Market.

A steady trade continues at prices that are firm and good. Beauty of Hebron, Snowdrop, and Up to Date, 75s. to 80s. per ton; White Hebron, Bruce, Magnum Bonum, Sutton's Early Regent, Imperator, and Reading Giant, 65s. to 70s. per ton; Blacklands, 60s. to 65s. per ton; Abundance, from Scotland, 60s. per ton; Germans, 2s. 9d. per bag.

EVERY HOUSE may shortly be supplied with electric light by a simple piece of mechanism placed over the kitchen chimney, if a new plan of Edison's for generating electricity directly from heat is successful. Thus the poorest person could have the benefit of a useful invention which is now regarded as a luxury only for the comfort of the rich. Mr. Thomas Holloway, however, has given a greater blessing to humanity than has yet been afforded by the most wonderful discoveries of science. His Pills and Ointment have succeeded in cases where the greatest authorities on medical treatment have failed. Whatever the condition of a patient may be, these medicines will effect a cure if such a thing is humanly possible.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Tomatos for Spring Fruiting.—J. S., Neath. We have seen the following tomatos succeed admirably as producers of early fruit, and probably they would suit you: Duke of York, Polga.e, Cropper, Earliest of All, and Frogmore Prolific. Perhaps your moist climate has something to do with the poor set obtained; try a little more warmth coupled with judicious ventilation.

Rotting Onions.—G. H., Coventry. We fear the onions could not have been properly dried and ripened before storing or that the store room was damp and unsuitable. It is just possible that the onions were frozen slightly and then handled before the frost was out of the bulbs; this soon causes the bulbs to decay. Thoroughly dry the sound bulbs on a stage or shelf in an airy greenhouse before returning them to dry, cool storage.

Support for Chrysanthemum Blooms. — G. P., Parkstone: The arrangement is a useful one, but we do not think it light and inexpensive enough for it to become popular, and consequently do not advise you to go to the expense of patenting or protecting it. It certainly does all you promise for it, but the majority of exhibitors will prefer the old method of wires and ties as being less expensive and almost as quick. If something lighter and less expensive could be designed, though still as serviceable, some sundriesman or chrysanthemum specialist might be persuaded to put the invention upon the market for you.

Mealy Bug on Vines.—F. D., Tooting: Practically nothing can be done with this pest until the grapes have all been cut, except to keep the bunches clean. Remove the crop as soon as possible, and then thoroughly syringe the vines and the woodwork of the house with a petroleum (paraffin) emulsion made as follows: Dissolve half a pound of hard yellow soap in one gallon of boiling water, and while the latter is still hot add two gallons of petroleum (paraffin or kerosene), and keep the whole well agitated with a small pump or jet syringe until the petroleum is well mixed with the soapy liquid. For application to the vines use one pint of this emulsion to one and a quarter or one and a half gallons of soft water. It will be advisable to place some tiffany or mats on the borders to catch any insects dislodged by the syringe. Repeat the operation at intervals of two or three days, taking care always to stir the emulsion before use, and to keep the syringing mixture well agitated while in use. Severer treatment should be accorded during winter, thoroughly cleansing the woodwork and also the vine rods.

Apple Tree Bored by Caterpillar.—T. C., West Hoathly: The damage to the apex of your apple tree is caused by the boring of the caterpillar of the Wood Leopard Moth (*Zeuzera pyrina syn. Z. æsculi*). The caterpillar or larva arrived safely in the piece of wood, and, being a well-developed specimen, was readily recognised by its yellowish colouring, two black spots on the head, a black plate on the second segment, and a large black shining plate on the last segment; there are also some raised black dots on the other segments. The larva does not confine itself to apple trees, but is occasionally found doing considerable damage to pear, willow, thorn, chestnut, birch, beech, lilac, and walnut trees. Fortunately the Wood Leopard moth is not common, but it is mostly met with in what may be called the London district. The larva feeds, during winter and early spring, upon the live wood of the tree it bores into; about May or June it becomes full grown and then spins itself a cocoon, turns to the chrysalis stage, and eventually emerges as a perfect imago or moth. Eggs are laid during July and August, and it is stated that one moth may lay at least three hundred oval, salmon-coloured eggs; the caterpillars soon hatch, and feed at first upon the bark, but soon those not destroyed by birds commence to bore into the wood, where they work galleries about a foot long and wider than themselves. As you have cut away the affected portion of the tree there is no need for remedial measures for that particular case; we advise you, however, to examine all your apple, pear, and other trees, so far as possible, to discover whether there are not other larvæ at work; keep a sharp lookout for the entrance to borings and the sawdust-like gnawed wood that appears there. When any such are discovered it is a good plan to push a stout pointed wire along the tunnel and so destroy the caterpillar; if the wire fails, then use a strong mixture of soft soap and tobacco liquor, forcing this into the boring by means of a syringe. If no more wood dust appears after the operation it may be taken for granted that the larva has been destroyed.

Names of Plants.—A. A., Holt: It is not possible to identify the plant from the specimens sent; send us a foot or two of growth and leafage next summer.

R. M., Patricroft: The plant is an oxalis, but we do not know which species, having no flowers for identification; we kept the plant several days, but all the flower-buds dropped. It is probably O. Bowiei.

J. W., Dereham: 1, Erica Austiniana; 2, Nerine Fothergilli major; 3, Hibbertia dentata.

L. B., Winchester: 1, Aster grandiflorus; 2, Oncidium crispum.

F. H. J., Reading: 1, Aphelandra aurantiaca; 2, Nothochlæna sinuata; 3, Nertera depressa; 4, Coccoloba platyclada; 5, Asparagus Sprengeri.

Names of Fruits.—R. W., Burnham: Tyler's Kernel.

W. H., Sleaford: 1, probably a local variety; 2, Northern Greening; 3 and 4, Dumelow's Seedling; 5, Lemon Pippin; 6, Dutch Mignonne; 7, London Pippin.

W. T., Croydon, pears: 1, Beurré Bosc; 2, Bergamot; 3, Easter Beurré; apples, 1, Waltham Abbey Seedling; 2, Reinette du Canada; 3, Emperor Alexander; 4, Lamb Abbey Pearmain; 5, Mère de Ménage; 6, Dumelows Seedling; one other variety was included, but it also seemed to be number 2, it was Tower of Glamis, while the more russety fruit was Reinette du Canada.

J. H., Wells: 1, Beurré Hardy; 2, Doyenne du Comice; 3, Aston Town; 4, Urbaniste; 5, Ribston Pippin; 6, Dumelow's Seedling.

S. H., Chippenham: Wormsley Pippin, a fine sample.

E. C. K., Ramsey: Appears to be Brown Beurré.

S. E. A., Yorks: 1, Warner's King; 2, Pickering's Seedling; 3, Swedish Reinette; 4 and 5, probably local varieties; 6, Newtown Pippin.

G. E. J, I. of W.: Two authorities have given it as Durondeau.

THE WEATHER DURING THE WEEK ENDING OCTOBER 29, 1898.

The mean reading of the Barometer during the week at Greenwich was 29 81 inches, and that of the Thermometer 55°·5, the latter being 8°·0 above the week's average in the 50 years 1841—90. The direction of the wind was south westerly, the horizontal movement of the air being 11 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 22·2 hours. The measured rainfall amounted to 1·03 inches.

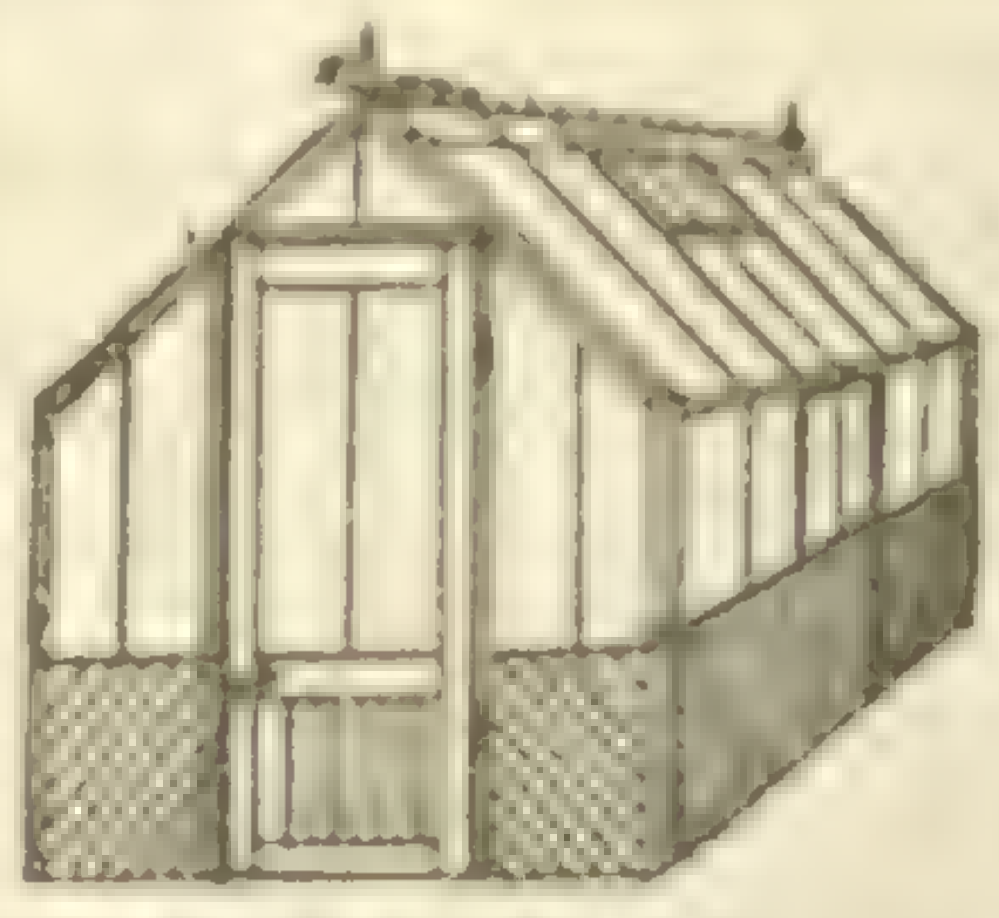
SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more beaded (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

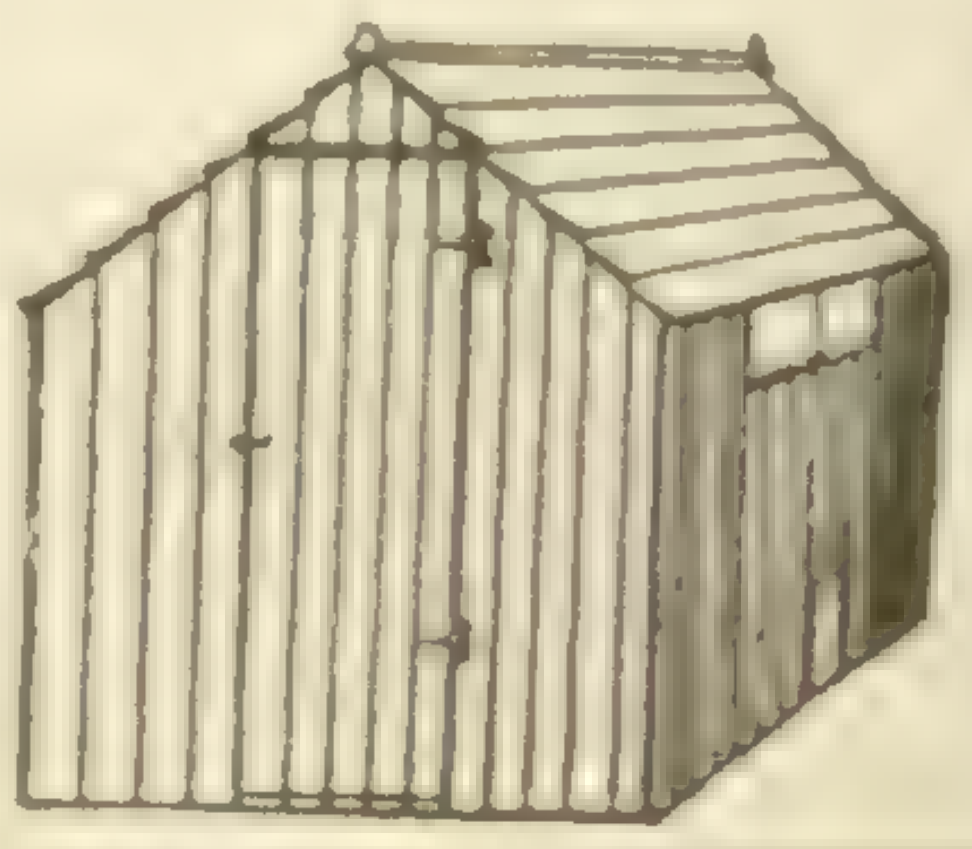


Size.	Lean-to.	Span.
[illegible] X [illegible]	36/-	48/6
[illegible] X [illegible]	48/6	58/6
14 X [illegible]	58/6	78/6
[illegible] X [illegible]	58/6	72/6
14 X [illegible]	78/6	95/-
14 X [illegible]	95/-	£5/7/6
[illegible] X [illegible]	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more?

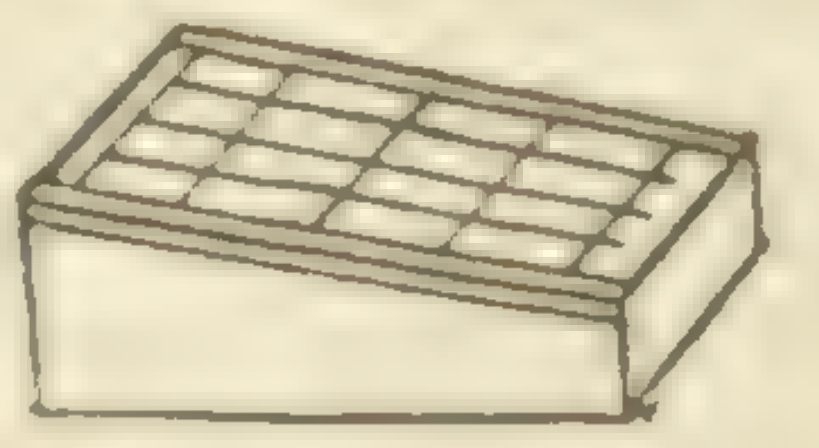
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to.	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half-inch wood, these are one-third thicker, and felt cover to roof.



4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21-oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

Apply for List to—

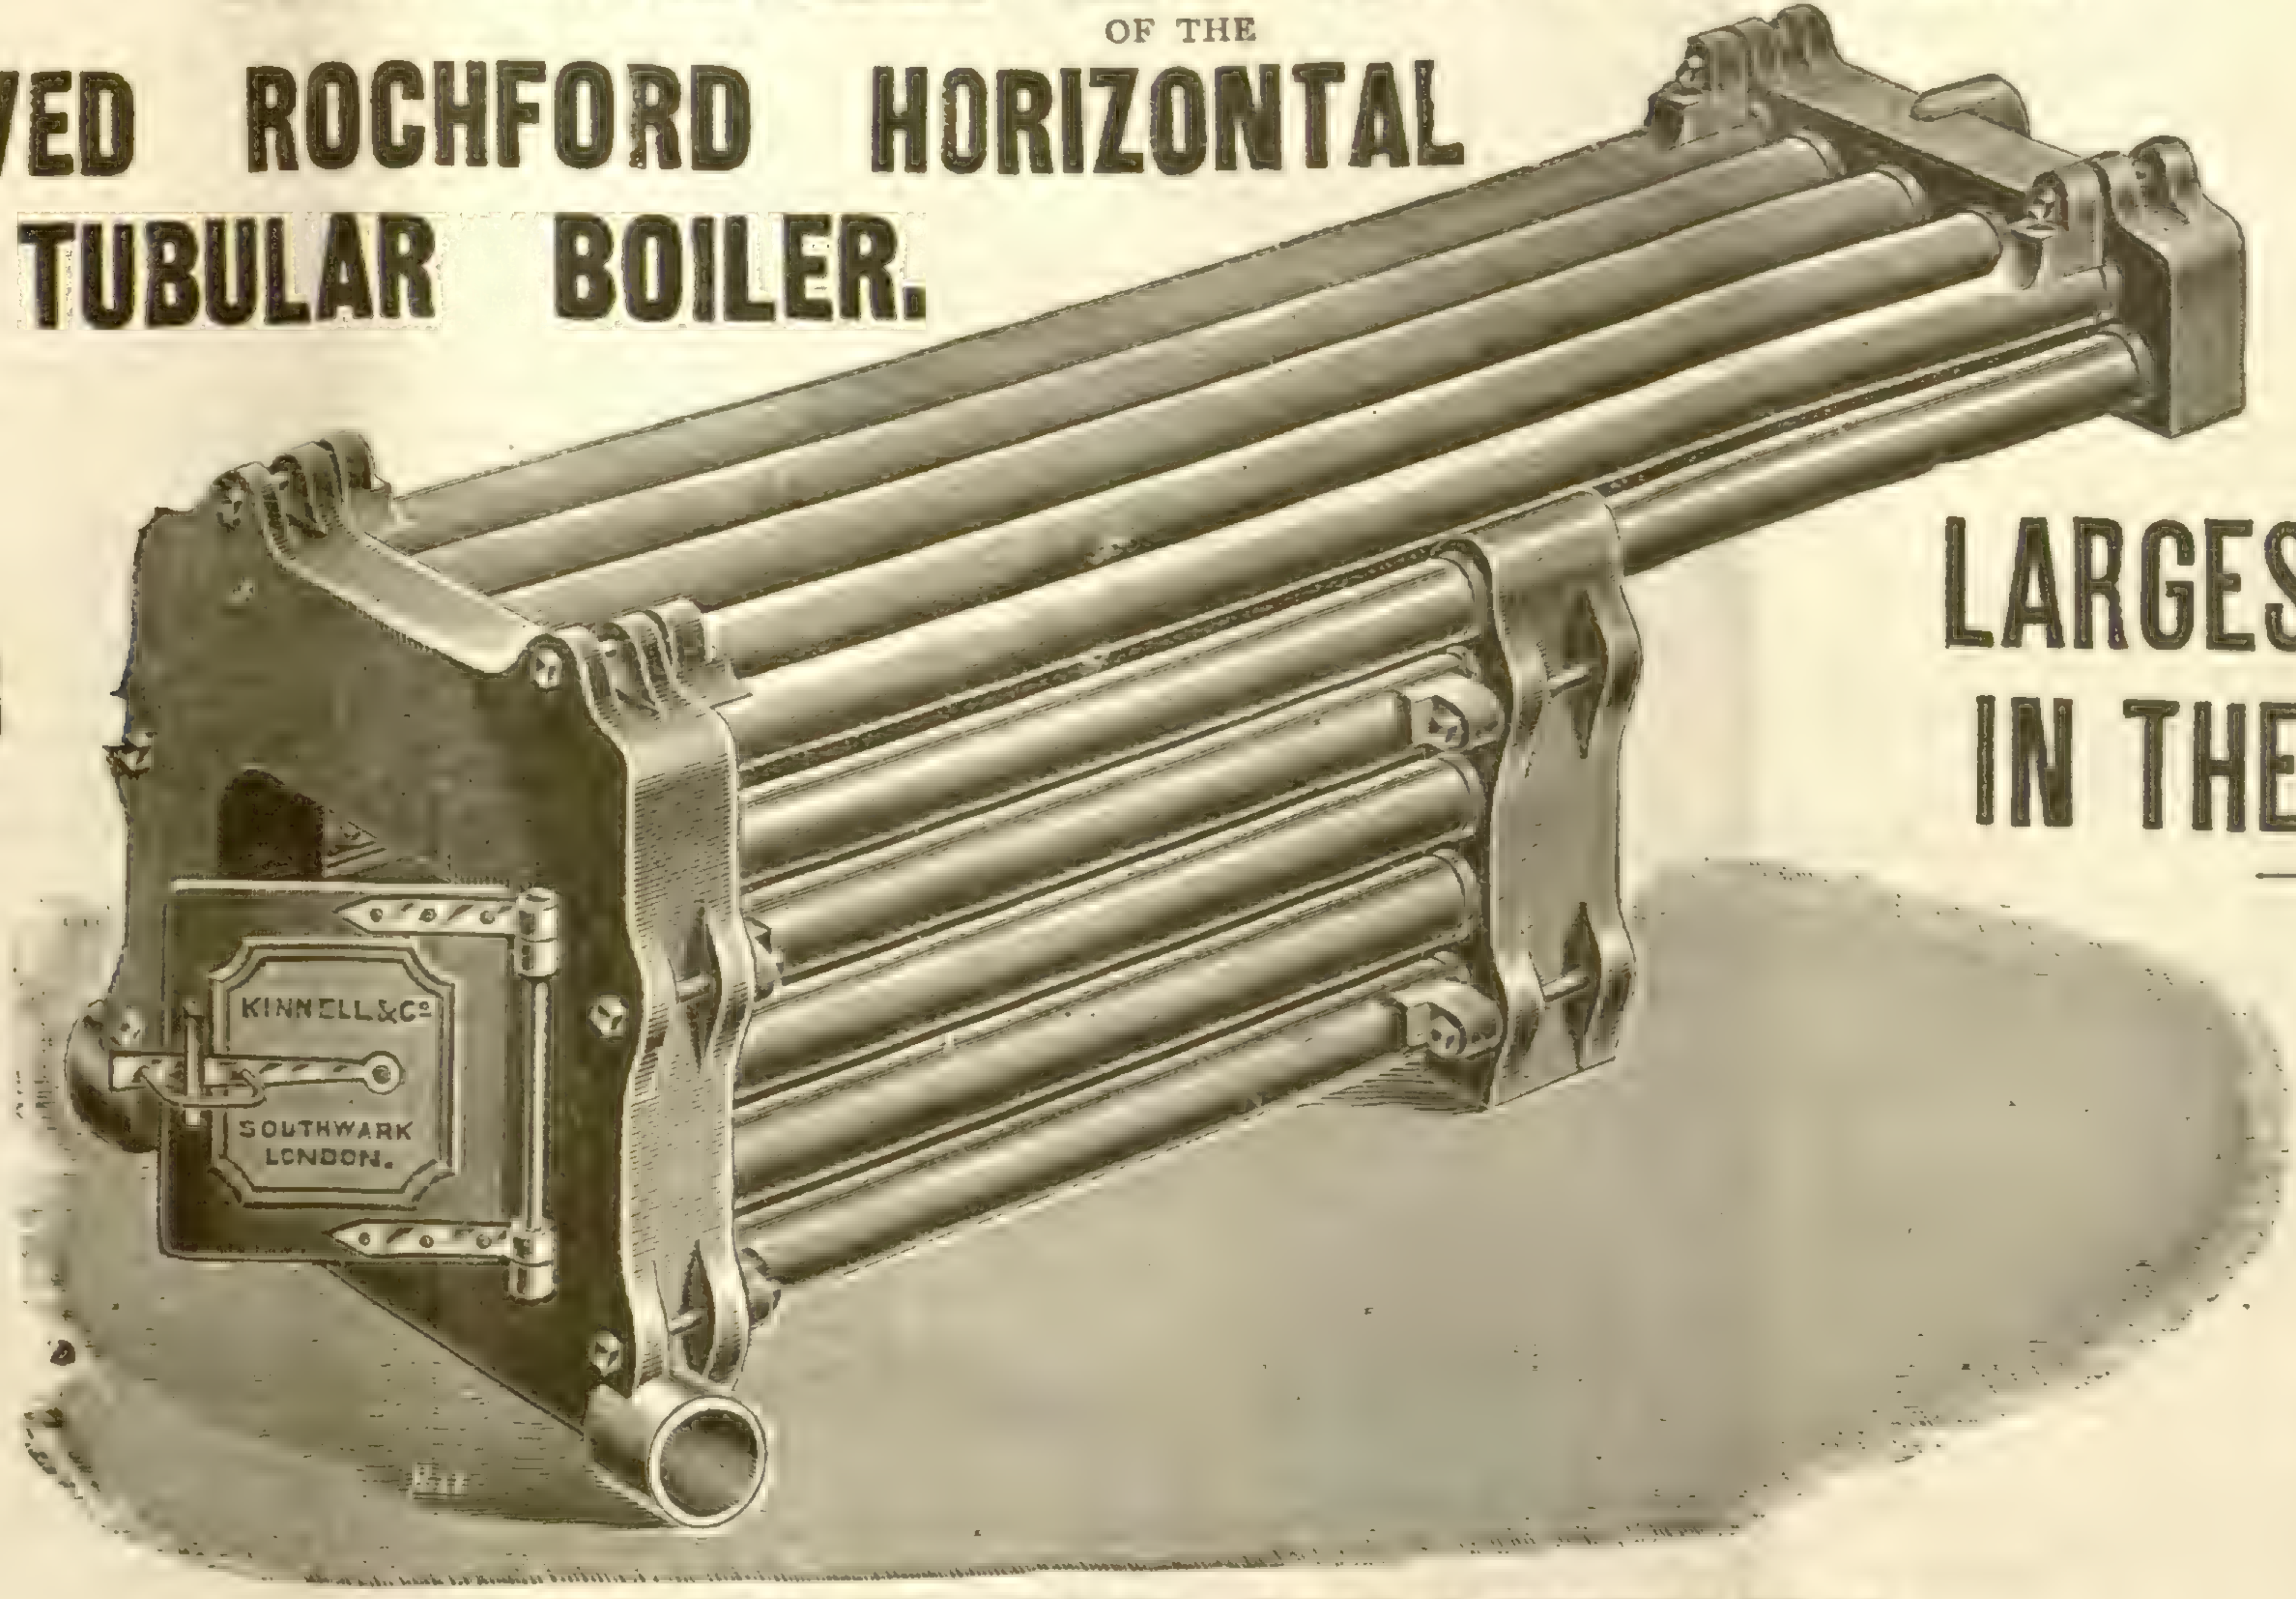
IMPROVED ROCHFORD HORIZONTAL TUBULAR BOILER.



Specialities FOR Greenhouse Heating.

LARGEST STOCK IN THE TRADE.

ENGINEERS SENT TO ALL PARTS.

Plans AND Estimates Free.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.

To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.

Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application.

Offices and Warehouses, **SOUTHWARK STREET, LONDON, S.E.**

CHRYSANTHEMUMS

ONLY,

At the N.C.S. SHOW, held at the Royal Aquarium, November 8th, 1898.

Situations Wanted.

Advertisements under this heading are charged 1s. each, four lines (32 words), and 3d. per line after. A Copy of the "Gardeners' Magazine," Post Free, 2½d.

THREE INSERTIONS FOR THE PRICE OF TWO!

AS GARDENER (Head or Single-handed); twenty years' thorough practical experience in all branches; age 35; married, one child; good references.—W. PEARCE, The Gardens, Ewelme Manor, Wallingford, Berks.

FOREMAN, Inside or General; age 26; 11 years' general experience, two as foreman where ten are employed; good references; life abstainer.—J. WILSON, Alton, Staffs

GARDENER (Head Working), where two or three are kept; age 28; single; good all-round experience.—Address GARDENER, 274, Romany Road, West Norwood.

GARDENER (Head Working) where two or three others are kept; age 27; married; 12 years' good practical experience in all branches; first-class references.—E. STRANGE, The Grange, Hindhead, Haslemere.

JOURNEYMAN (Second or Third), inside, in gentleman's establishment; three years' experience; age 19; good character and reference.—J. REDDING, Holbrook, Ipswich, Suffolk.

MRS. G. WILDER (late of Stansted Park) highly RECOMMENDS her Gardener. He has been in her service as above for 20 years. He is a thorough all-round Gardener for a good establishment. Total abstainer.—Apply C. HOSKINS, Stansted Park, Emsworth, Sussex.

RICHARD SMITH and CO., beg to announce that they are constantly receiving applications from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries. Worcester.

SHOPMAN.—Well up in Seeds, Bulbs, Wreaths, Crosses, Plants, and general nursery stock; good salesman; age 35; twenty-one years with present employer.—F. PRIME, Trumpington, Cambridge.

SITUATION WANTED by a Young Man as Under Gardener, Inside or Out; thirteen years' good reference; age 26.—Address WILLIAM COLLYER, Dagmar House, Lyne, Chertsey, Surrey.

TO NURSERYMEN.—FOREMAN PROPAGATOR and Grower in first-class establishment; well up in grafting roses, clematis, cut flowers, stove and greenhouse plants, forcing, and decorating; good references.—Apply T. K., 7, Eagle Cottages, Friarwood, Pontefract, Yorks.

UNDER GARDENER.—Highly recommended. Experienced in all Glass and Outside work; moderate wages; good place first object.—Apply Hon. LADY SUPERINTENDENT, Provincial Police Orphanage, Redhill, Surrey.

YOUNG MAN SEEKS SITUATION as Journeyman; age 20; 4½ years in present place; Inside and Out preferred; good reference can be had.—Apply to Mr. J. MURPHY, Gardener, or A. W. Moore, Esq., Cronkbourne, near Douglas, Isle of Man.

Situations Vacant.

WANTED after Christmas Experienced Single-handed working GENERAL GARDENER to help Owner develop established Nurseries. One preferred understanding field flowers, mushrooms; starting with small salary and profit percentage. Splendid opportunity to a faithful, diligent man.—Write by December 1, "Nurseries," 8972, GARDENERS' MAGAZINE Offices, 148 and 149, Aldersgate-street, E.C.

WANTED, Young Experienced GARDENER for Jobbing and Indoor work; constancy for suitable Man.—Apply FLORIST, 312, Balham High Road, Tooting, S W.

IMPORTANT NOTICE.

AN EMPLOYMENT REGISTRY DEPARTMENT IS CONDUCTED IN CONNEXION WITH THE "GARDENERS' MAGAZINE," AND THE CHARGE FOR AN ADVERTISEMENT ***INCLUDES A FREE ENTRY ON THE REGISTER FOR ONE MONTH.*** IF NOT SUITED AT THE END OF THAT TIME, AND IT IS DESIRED THAT A NAME SHOULD REMAIN, IT WILL BE CONTINUED FOR A FURTHER PERIOD UPON RECEIPT OF A REQUEST. IMMEDIATE NOTICE MUST BE GIVEN WHEN AN ENGAGEMENT IS SECURED.

A List of Gardeners on the Register will be supplied upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

CANNELL'S CHRYSANTHEMUMS.

Come and See.

AN enormous amount of evidence confirming our special system, first adopted by us for propagating from properly prepared stock, from pure, clean, healthy, open-field grown stools, free from fungi, has come to light, and is still coming and proving more and more that ours are far the best, the key to success, and win more victories than, perhaps, all others put together.

Please remember our forte and aim is stock of the best quality, carrying satisfaction all over the world. The following is unmistakable:—

"Mr. H. ADAM, Hon. Secretary,
"Dunedin Chrysanthemum Club, New Zealand,
"September 13, 1898.

"We received the chrysanthemums. I am instructed by my committee to thank you very much for your liberal treatment The plants arrived in splendid condition; only two died out of the 44; forward me your catalogues, as you can rely on us ordering.

"H. Cannell and Sons, Swanley, Kent."

CHRYSANTHEMUMS.

BEST RESULTS

Are obtained by starting with healthy country-grown Plants and Cuttings. To prove that GODFREY'S STOCK IS SECOND TO NONE it is only necessary to point to the fact that he has been awarded in one season more Certificates by the National Chrysanthemum and Royal Horticultural Societies for Exhibition Japs than *all other trade growers combined.*

Every bloom so certificated was grown in the Exmouth Nurseries, and had not been "put to be grown," as many frequently are by Chrysanthemum Specialists. Further comments are needless.

CATALOGUES.—Godfrey's Descriptive Catalogue should be in the hands of all, amateur or expert. It contains more *Practical, Reliable, and Interesting matter than any other published.* Post free.

W. J. GODFREY,
EXMOUTH, DEVON.

ROSES. ROSES.

THE BEST and CHEAPEST in the WORLD. 12 acres of Roses. 100,000 grand plants to select from. 40 choice dwarf Perpetuals for 21s. 20 choice Standards or Half-Standards for 21s.; purchaser's selection. 50 Dwarfs, unnamed, 12s. 6d. The following are my selection, carriage free; 12 choice Teas and Noisettes, 9s.; 6 Maréchal Niels, 5s.; 12 choice Climbing, 7s; 12 best hybrid Perpetuals, dwfs., 7s.; 6 lovely yellow Roses, 5s.; 6 Gloire de Dijons, 4s. 6d; 6 beautiful Fairy Roses, 4s. 6d.; 6 choice Moss Roses, 4s.; 6 old Cabbage Roses, 4s.; 6 old-fashioned Roses, 4s.; 6 crimson Monthly Roses, 3s. 6d.; 6 pink Monthly Roses, 2s. 6d; 6 white Monthly Roses, 3s. 6d.; 6 quick-growing Climbing Roses, 2s. 6d.; 12 Sweet Briers, 3s. All for cash with order. Thousands of testimonials. Catalogues free.

HORTICULTURAL CORRESPONDENCE CLASSES.—For PROSPECTUS and LIST of PRIZES apply T. H. SMITH, 18, Somerville Road, Small Heath, Birmingham. First Examination Paper ready November 5. Join early for the whole course.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

THE NATIONAL CHRYSANTHEMUM SOCIETY'S EXHIBITION.

THE great exhibition which has been held under the auspices of the National Chrysanthemum Society during the past week has been of special interest to those who fully appreciate the importance of the work in which the society is engaged, and are jealous of the reputation it enjoys as the foremost chrysanthemum society in the world. This gathering has marked an important event in the history of the society, and it has proved to demonstration the remarkable influence the latter has upon those who aspire to honours as exhibitors of the Golden Flower in its many forms. Two years ago the society celebrated its jubilee in a befitting manner, and this year it has celebrated its twenty-first year at Westminster. With the exception of one class, no special provisions were made to distinguish this exhibition from the shows held in November under normal conditions, and it is therefore more useful for purposes of comparison than would have been the case had the prize list been specially augmented. There may be some difficulty in comparing the exhibitions held during the week with those of the past two or three years, more especially as in 1896 the society's jubilee was celebrated, but there is none in determining with exactitude the enormous advance that has been made since the society migrated from the north-east to the west of London. The Assembly Rooms at Stoke Newington and the Hackney Town Hall were considerably less spacious than St. Stephen's Hall, which was no more than sufficient for the display of the specimen plants and vegetables, and yet there was no overcrowding of either products or visitors in the suburban buildings. For two or three years after the exhibitions were held at the Royal Aquarium the products used a portion only of the ground floor when supplemented by palms and other plants hired for the purpose of enhancing the display. This year not only was St. Stephen's Hall filled to its utmost capacity, but the ground floor and the two immense galleries of the Royal Aquarium were so fully occupied that, had the entries been more numerous, no small difficulty would have been experienced in finding room for the exhibits. It is, of course, a matter of common knowledge that these exhibitions have grown to immense proportions; but in view of the criticism to which the society has been subjected during the past twelve months we regard it as a duty to point to its enormous growth during the past twenty-one years as a proof that the executive has not been so wanting in judgment as some of the critics have endeavoured to show in remaining at Westminster. Of the details of this great gathering we must leave the full and special report given in this issue to speak. It was a truly magnificent display, worthy alike of the society and those who so liberally contributed the products of their skill, and it was, by reason of its varied character, of much interest. Very wisely the chrysanthemums are supplemented by fruits and vegetables, and although these are not, as we are sometimes told, related to the golden Flower, chrysanthemum growers are interested in the products of the kitchen and fruit gardens, and as exemplified at so many shows, it is possible for exhibitors to simultaneously obtain honours for chrysanthemums, fruits, and vegetables. But this is not the only point; visitors have to be considered, and, speaking in a general way, the most successful exhibitions are those of which the attractions are such as to satisfy diverse tastes. We were pleased to find that our advocacy in these pages of the importance of encouraging the decorative aspects of the chrysanthemum is bearing good fruit, and that on this occasion the vases, baskets, epergnes, and other arrangements formed a large and highly attractive feature that was evidently much appreciated by the general public.

FRONDLESS FERNS.

FERNS, as we generally know them, being composed entirely of fronds and roots, the latter of which are simply feeders to the former, ferns without fronds would seem to be an absurdity, yet Dr. W. H. Lang's recently issued monograph, entitled "On Apogamy and the Development of Sporangia upon Fern-Prothalli" (Philosophical Transactions of the Royal Society, series B., vol. 190, 1898, pp. 187-238), demonstrates their actual existence. Until quite recently the normal forms of ferns were alone deemed worthy of the attention of the scientific botanist, but this most interesting paper embodies the result of some two years' active research into the phenomena of reproduction of varietal forms, the result being, as might have been expected, that the varietal character was found to be by no means confined to the obvious and external types of frond, but extended also to the minuter details of the reproductive phenomena which present themselves on the little green scale produced by the spore, and upon which the sexual organs or flowers of the fern are developed. Normally this small green scale or prothallus is heart-shaped, and about the size of a herring scale; it attaches itself to the soil by a number of root hairs, and bears upon its under side two types of organs, the antheridia, or male, and archegonia, or female, the former scattered about in considerable numbers among the root hairs, and the latter, much fewer in number, being seated on a thickened cushion near the indentation of the hearts. The antheridia burst when ripe, and a number of organisms, equivalent to mobile pollen grains, are thrown out, which subsequently fertilize the embryo seed contained in the archegonia. This then develops into a fern with fronds, and a new generation is launched into being. Professor Farlow found that in some cases young plants were formed by simple non-fertilised buds on the site of absent archegonia, and to this mode of reproduction the descriptive name apogamy (or no marriage) was given. Dr. Lang's researches have shown that this apogamic method can be induced by preventing normal fertilisation by withholding the water, in which alone the antherozoids can make their way to the ovum or embryo seed. The prothalli then continue to grow, often in the most eccentric fashion, and eventually find outlets for their reproductive energies, not merely by apogamic buds, which develop into typical ferns, but in some cases they go the wrong way to work, as it were, and throw out strong roots (as distinct from root hairs) into the soil prior to, or, so far as the examples examined were concerned, without forming a fern plant at all. Other prothalli budded out into bunches of prothalli; others again, and these were the most interesting, formed thick cylindrical outgrowths from the heart indentation, and upon these growths, in which, of course, all the potentialities of fern life must exist, these potentialities broke out, not only in the form of both types of sexual organs, but also of roots, viviparous buds, and, finally, the most unexpected feature of all and the most original, actual heaps of spore cases, containing spores, precisely such as we find on the backs of fronds of mature plants. Here, of course, is an absolutely frondless fern, since no approach to frond formation precedes their appearance, and assuming such spores to be capable of germination (which has yet to be demonstrated), and their progeny inherited this peculiar precocity, we should have a new class of ferns altogether, which to the naked eye could not be distinguished from liverworts.

"CUI BONO?"

"CUI BONO?," or "What is the use of it?" is one of those phrases which are as often tacitly implied as openly expressed to those who are vulgarly considered as poking and prying into the secrets of Nature to no conceivable purpose whatever, and the most provoking part of the matter to the poker and pryer is that it is usually precisely that class of persons who put the question who are least capable of comprehending a rational reply. Very often, too, the investigations partake so much of a fishing character that no definite reply can be given, the belief, based on previous experience, vicarious or personal, that something may turn up being all that the explorer has before him as an inducement. If, however, it could be brought home to the querists that practically all our civilization, with its comforts, refinements, and luxuries, has been built up by virtue of discoveries, small and large, arrived at under circumstances where the "Cui bono?" seemed most justifiable, he or she would probably abate a trifle of the superciliousness which usually underlies the question. Take, for instance, our wonderful array of flowers, fruits, and foliage plants. Nature, it is true, has fashioned a host of these all by herself, as it were; but even these, so far as their presence here goes, we owe to the enthusiastic botanist or collector, who is doubtless regarded by the savages or semi-civilised natives as a mild and harmless maniac, and the "Cui bono" consequently finds itself translated into their local tongues, and expressed with much the same unction as by civilised ones. Bit by bit, however, these explorers have brought together such galaxies of floral charm as we see at Kew and elsewhere, and with the material so supplied another set of pokers and pryers go to work, and, seizing upon an oddity here and a feature there, start every now and again a new strain or combination of such a character that, although a thousand failures may have justified Mr. and Mrs. Cui Bono for a time, this one brilliant success eventually enriches the floral world with a gem which amply makes up for the loss and trouble, and answers the question conclusively. So with mechanics. A thoughtful lad sits apparently idly watching the oscillations of the kettle lid, agitated by the escaping steam. "Cui bono?" is the question; but that seeming waste of time over a trivial everyday occurrence is the fertilizing moment of the world's greatest industries, all based on steam power. In the olden days the research into the tiny unseen world of the microscope was ever met by the same query. Man was a special creation, far and away above such insignificant matters as germs and animalculæ; but now the poker and pryer has his day, when, through the knowledge gained little by little and atom by atom, he demonstrates that man is absolutely dependent for his existence upon these unseen friends and foes, and once again the scornful questioner is vanquished when, by the minute study of the life histories of these tiny organisms, we are enabled to baffle their attacks at the outset if they be foes, or to second their efforts if they be friends, with absolute certainty of results. We are indeed surrounded by, and made up of, innumerable facts and factors, each one of which is a link in a chain of natural causes. Hence, whenever the investigator finds himself baffled in following up this chain, regardless of "Cui bono?" he is never satisfied until the seeming anomaly is explained, and not seldom finds that explanation to open up a new set of hitherto unexpected facts of endless utility and value inestimable.

IMPORTS OF FRUIT AND VEGETABLES.

THE returns issued by the Board of Trade for the past month are less satisfactory than were those for September, the increase in the exports being small, while in the imports there was a decrease; but in no case was the change sufficient to justify a feeling of anxiety with regard to the course of trade. The majority of the products in which our readers are specially interested show an increase, and again indicate the dependence of this country upon foreign and colonial cultivators for fruit and vegetables. The imports of apples amounted to 694,027 bushels, of the value of £202,562, or an increase in quantity of 236,580 bushels, and in value of £80,179. Of plums also there was a large increase, the imports being 93,307 bushels, against 29,289 bushels in the corresponding month of last year. The values of these fruits received in the two months are returned as £29,229 and £9,514 respectively, and these figures should be sufficient to convince the sceptical that we have not as yet planted plum orchards in excess of the requirements of the community. Grapes were received in large quantities, the imports aggregating 346,049 bushels, of the value of £173 426, against 360,151 bushels, of the value of £173,670 in October, 1897. There was no great change in the quantities of pears imported during the past month and the corresponding month of last year, but there was a material difference in the values. Last month we imported 103,217 bushels, of the value of £49,000, and in October, 1897, the imports amounted to 107,527 bushels, of the value of £39,595. There was thus a drop of 4,308 bushels, and an increase in value of £9,405, a change which the producers can hardly fail to regard as otherwise than satisfactory. Unenumerated fruits continue to be received in increased quantities, and last month we imported 83,361 bushels in excess of the imports in the corresponding month of last year, and the value is returned as exceeding by £24,327 the amount paid for the imports in that period. We have an indication of the satisfactory crop of potatos that has this year been harvested in the fact that last month the imports of tubers were 105,112 cwt., against 325,253 cwt. in October, 1897, the values for the two months being given as £18,601 and £54,902 respectively. Notwithstanding a saving of £36,301 in the month, our bill for potatos will be a heavy one this year, for it already amounts to £1,876,618, or nearly £1,000,000 more than was paid in the corresponding period of each of the two previous years. France and Germany have benefited to the largest extent from the unsatisfactory character of the potato crop lifted in 1897; but no one will grumble at this. On the contrary, considering the shortness of our crop last year, the community have cause to be grateful to these countries for the aid they rendered in this direction.

Gardening Year Book for 1899 is, with the exception of one or two sections, now in the printers' hands, and the Editor will be greatly obliged by information relating to changes in the public parks and gardens of the United Kingdom being sent to him at once. The communications should be addressed, The Editor, "Gardening Year Book," 148 and 149, Aldersgate Street, E.C.

Commercial Mushroom Culture in Scotland has undergone material development of late years, and at the present time it has become in Edinburgh an important industry. There is an old, disused railway tunnel under the city, and, perceiving its adaptability for the production of mushrooms, a Glasgow firm leased it ten years since from the North British Railway Company, to whom it belongs. Possession having been obtained of the tunnel, many hundred tons of soil and manure were deposited in it, the beds were formed and spawned, and in due course produced a crop of so high a quality as to show how well suited the tunnel is for the growth of this toothsome esculent. The beds in consequence rapidly increased in numbers, and at the present time there are eight hundred mushroom beds in various stages. In fact, the whole of the floor is covered with them except the space occupied by the single line of rails used for the conveyance of the manure and soil to various parts of the tunnel. About one thousand tons of manure and one thousand baskets of spawn are used annually, and the highest monthly output is about five thousand pounds. The Scottish Mushroom Company, by whom the Edinburgh tunnel is leased, being so well satisfied with the results obtained, are negotiating for a lease of the disused railway tunnel under the Law Hill, Dundee, for the purposing of devoting it to mushroom culture, this tunnel, as in the case of that at Edinburgh, affording a large area of floor space.

Judging New Chrysanthemums in America.—The Chrysanthemum Society of America has a committee to adjudicate upon new seedling chrysanthemums, but the methods of procedure differ from those of the N.C.S. Exhibitors have to pay a fee of two dollars for every variety entered, but this entry fee entitles the exhibitor to submit the variety before as many committees as he may desire. Six blooms are required of each variety shown, and to be eligible each variety must have been tested at least two years. No member of a committee shall show his bloom before the committee of which he is a member. Varieties scoring 85 points are entitled to the society's first-class certificate. Foreign varieties may also be entered and certificated under the same conditions. All numbered seedlings entered must also be provided with a name. In case the variety does not score enough to secure a certificate, and the exhibitor desires to apply this name to some other variety in the future, it will appear in all reports under number if the secretary be so requested. The scale of points adopted by the Chrysanthemum Society of America for exhibition blooms is: Colour, 25; form, 25; fulness, 15; stem, 10; petallage, 10; and size, 15—total, 100. The committees meet four times in October, and the same in November; and sit at New York, Boston, Philadelphia, Cincinnati, and Chicago.

Baldwin's and Champion Black Currants.—Mr. A. H. Pearson, Chilwell, writes: I note the remarks of "Lux" in your issue of November 5 respecting the supposed similarity of Baldwin's and Black Champion black currants, and I must say I was surprised to find them entered in the Royal Horticultural Society's pamphlet on "Fruits for Cottagers" as identical. We procured our stock of Baldwins some years ago from Mr. Bunyard, and believe the stock is true, but it is certainly distinct from Black Champion. The most important difference between the two seems to be that Champion frequently dies back after pruning, especially when the pruning is done early in the season, a weakness which I have never seen in Baldwin's. Again, the wood of Baldwin's is not so thick as Champion and darker in colour; the fruit of Champion is larger, but we think Baldwin's the better cropper. I am speaking of young trees grown side by side in the nurseries. I do not write this for the sake of argument, but simply with a view to obtain more light on the subject.

The Uses of Leaf-cups.—When a gardener wishes to protect a choice plant from the attacks of ants or slugs he places it on the top of an inverted flower-pot and places this in the middle of a flat dish containing water, where it stands, as it were, on an island inaccessible to the ants, many of which perish in their ineffectual attempts to reach it. Similarly, says *Knowledge*, the water in the leaf-cups of the teasle surrounds and isolates the stem; the leaves and flowers are protected as by a moat from the attacks of creeping insects. Although such protection is perhaps their original use, leaf-cups in many instances appear to have assumed an additional function. Mr. F. Darwin has observed that certain hairs in the leaf-cups of the teasle emit protoplasmic threads into the water; this also occurs in the case of Silphium. As filaments exactly similar are emitted from certain cells in the little traps of the toothwort, now regarded as a carnivorous plant, there can be little doubt that leaf cups serve to some extent like the pitchers of Nepenthes and Sarracenia for capturing insects, and that they consequently furnish the plant with an important source of nitrogen. This view is confirmed by the frequent presence of putrefactive bacteria in the water of leaf-cups. It has been found that when a drop of water containing carbonate of ammonia in solution is placed on a leaf, after a time both water and salt disappear. Leaves as well as roots therefore take up ammonia, and this explains why plants which have no true power of digestion are yet benefited by capturing insects; from the decomposing bodies of their victims products are evolved which the plants are able to assimilate.

R.H.S. Meetings for 1899.—The fortnightly exhibitions of the Royal Horticultural Society, together with the meetings of the various committees, will be held at the Drill Hall, St. James' Street, Westminster, on the following dates in 1899: January 10 and 31; February 14 and 28; March 14 and 28; April 18; May 2 and 16; June 13 and 27; July 11 and 25; August 15 and 29; September 12 and 26; October 10 and 24; November 7 and 21; and December 5 and 19. As the R.H.S. year does not end in December there are two fixtures made for the year 1900, viz., January 9 and 23. The Great May Exhibition at the Inner Temple Gardens will be held on May 31 and June 1 and 2, while the Great Exhibition of British Grown Fruit is fixed for September 28, 29, and 30, to take place at the Crystal Palace, Sydenham, as usual.

Lonicera Hildebrandiana, a very large flowered honeysuckle, was discovered in Upper Burma in 1878 by General Sir Henry Collett, K.C.B., F.L.S., and described in the Journal of the Linnean Society (vol. xxviii., page 664) as "a conspicuous shrub, with large, dark, glossy leaves, and fine crimson flowers seven inches long, and is by far the largest of any known species of honeysuckle." Seeds of it were kindly forwarded to Kew in 1894 by Mr. A. H. Hildebrand, C.I.E., Superintendent and Political Officer of the Southern Shan States, after whom the plant is named, and plants raised from them were liberally distributed. According to the *Kew Bulletin*, it proved too tender for cultivation in the open air at Kew; on the other hand, it has grown vigorously under greenhouse treatment, but has not yet flowered. Mr. F. W. Moore, the able keeper of the Royal Botanic Gardens, Glasnevin, has, however, been more successful, flowers having been produced there in August last on a plant grown in a sunny, airy position in a greenhouse. The example forwarded to Kew by Mr. Moore bore two-flowered axillary racemes, with flowers six inches long, and of a bright golden colour – not crimson, as stated in the note quoted above. Writing from Burma in April last year, Mr. Hildebrand said: I am sorry that you are unable to flower the large honeysuckle and rose (Rosa gigantea). The former is a sight to behold just now in my garden, and strikes the densest in horticultural matters with astonishment. It is a mass of flowers, white when they open, and of a lovely gold when far spent. It flowers on last year's wood. Water at the roots is what both rose and honeysuckle require.

The premier chrysanthemum bloom at the N.C.S. exhibition held on November 8, 9, 10, at the Royal Aquarium was a magnificent example of G. J. Warren shown by Mr. Vallis, Bromham Fruit Farm, near Chippenham, who was a good second to Mr. Lees for the Holmes Memorial Cup, offered for 48 Japanese blooms. This premier bloom won Mr. Simpson's special prize of one guinea, together with portrait in oils of the flower itself.

Gardeners' Royal Benevolent Institution.—We are requested to state that the committee of the above institution have been obliged to remove their offices from 50, Parliament Street, to 175, Victoria Street, S.W., to which address all communications should in future be sent. We need scarcely remind our readers that Mr. G. J. Ingram is the secretary of this excellent charity.

Early-flowering Chrysanthemums from Scotland.—It may at first sight seem absurd to write about early chrysanthemum flowers at the present time, when chrysanthemum shows are being held everywhere; but the weather has been kind to garden flowers, and both chrysanthemums and dahlias are still flowering, unprotected, as we write. Only a few days ago we received two boxes of early-flowering chrysanthemums from Messrs. Dobbie and Co., cut from the open ground at their Rothesay nursery; the collection contained sixty varieties, and the flowers in varied shades of crimson, orange, bronze, white, yellow, rose, and mauve are still making our office quite gay. The varieties that best suit our taste are Madame Fouchier de Carie, Orange Child, White Lady, Edith Syratt, Piercy's Seedling, Alfred Drcz, Jeanne Villermet, Louis Lemaire, Max Duforse, Canari, A. J. Quintus, Silversmith, and Mrs. Carmeaux. All the sixty varieties were beautiful, however, while their usefulness cannot be denied.

Aster-flowered Dahlias.—According to an American contemporary, the *Weekly Florists' Review*, the next sensation in dahlia culture will be the new type to be called the "Aster-flowered." The description of the class is as follows: "Flowers not as large as the show type; petals, however, are longer and often rolled or folded, sometimes cut, serrated or fringed, inner petals often curled and twisted; always shows a small yellow centre; blossoms very graceful, usually on long stems, and unequalled for cut flowers. They undoubtedly will be a great acquisition." Judging from the photographic illustration accompanying this note, we do not think aster-flowered dahlias will become popular in this country, especially as we have now practically rejected what were formerly classed as "decorative" varieties.

An Agri-Horticultural Congress will be held in connection with the Universal Exposition that takes place in Paris in 1900. It has been decided to discuss agricultural, sylvicultural, and horticultural matters and also dairying. There will probably be a general horticultural congress during the first fortnight of May, 1900, while fruit culture will be the particular subject for a congress to be held in conjunction with the autumn exhibition of fruit. Like the Exposition itself, these congresses will be international in character and under the immediate patronage of the French Government.

The Oldest India-rubber Plantation in the World is, perhaps, one existing in the west of Java, in the province of Kranong. A former proprietor of the Pamanockan Tjiassan Estate, which is the biggest private property in Java, containing 540,000 Dutch acres, had most of his land under coffee until 1872. Finding the cultivation of this plant was no longer lucrative, he planted some of the land up with Ficus elastica. The coffee plantations had already been more or less cleared of forest growth, so that the planting of Ficus elastica cost less than thirty shillings per acre. The soil of these coffee gardens had become useless for other agricultural purposes; and, had not Ficus elastica been planted in time, would only have become covered with poor forest growth. The trees were planted 8¼ yards apart, or 72 trees to the acre. The area planted was 72½ acres, containing 5,200 stems. The trees were first tapped when the plantation was 14 years old, and the yield for that and the six following years was: 1886, 5,512 lbs., [illegible]; 1887, 4,954 lbs, £540; 1888, 1,514 lbs., £165; 1890, 3.307 lbs., £360; [illegible]1, 6,113 lbs., £387; 1892, 5,992 lbs., £256; 1895, 3,197 lbs., £411; total, [illegible] lbs., valued at £2,719. Seventy-two and a-half acres thus, says the *Indian* [illegible], yielded in seven years a surplus of £2,712, or £5 8s. per acre per annum. The yield was 71 lbs. per acre per annum during this period. During the 23 [illegible] from the establishment of the plantation in 1872 till 1895 the net yield [illegible] acre per annum amounted to £1 12s. 10d.

Symbiosis in Plant Life.—The term symbiosis is applied to those curious [illegible] in which we find two organisms of different kinds living together in [illegible] for mutual benefit and protection. A remarkable example of such symbiotic association is afforded, states the Rev. Alex. Wilson, M.A., in *Knowledge*, by certain rotifers which take up their abode in the pitcher-like leaflets of some Jungermannias. One of these liverworts (*Frullania dilatata*) growing on the bark of species of Acer has hollow appendages of this description in which the water is retained by capillary attraction. In each of these pitchers a rotifer (*Callidina symbiotica*) takes up its quarters, finding in this retreat food and shelter. The association in all probability is one of mutual advantage; the rotifer is supposed to make a return to the plant for its entertainment in the shape of excrementitious products. The water-vessels of the Bromelias and allied epiphytes, which often contain half a pint or more of water, are particularly interesting. The hollow leaf-base in some of this group of plants is a veritable aquarium. The water which accumulates in these curious receptacles Fritz Müller found to be inhabited by caddis-flies, entomostracans, and aquatic beetles belonging to species not occurring elsewhere. A small frog even takes up its abode among the bromelian leaves. Species of Utricularia also occur—small aquatic plants which capture in their curious little bladders the tiny crustaceans inhabiting the water in the bromelia leaves where they grow. U. nelumbifolia in this way grows in the leaves of Tillandsias, which are themselves epiphytes on the branches of other plants.

The Mild Weather of this Month is somewhat unusual even for a late season. A correspondent writes from Broadstairs that on November 4 the thermometer registered 92 degrees in the sun at 10.45 a.m., while the shade temperature was 63 degrees. At this seaside resort, and indeed throughout most of the southern counties, roses, pelargoniums, marguerites, petunias, heliotropes, chrysanthemums, marguerite carnations, stocks, tropœolums, and primroses are still flowering with considerable freedom where they have not been removed to make room for bulbs and other spring-flowering subjects.

Chrysanthemum Mrs. W. Mease.—Mr. W. J. Godfrey writes: "In the last issue of the Gardeners' Magazine in reporting on this variety, blooms of which were certificated by the N.C.S., it is stated [Where?—Ed.] that 'it is a beautiful primrose-yellow sport from Madame Carnot, shown for the first time last year by Mr. W. Mease, by whom it was fixed.' This is hardly correct, for Mr. Mease had nothing to do with the fixing of the sport of which blooms were exhibited. Madame Carnot sported in several places two seasons since, and having a primrose-yellow one almost identical, if not quite, with the sport of Mr. Mease's, I did not consider it advisable to 'split hairs' over the name and adopted the name 'Mrs. Mease.' As we have had shades of yellow, we may reasonably expect one of a still darker and richer tone."

Horticulture v. Agriculture—In his interesting and useful "Story of the Farm," Professor J. Long makes what at first sight seems a startling statement, viz., that within a radius of twenty miles of London thousands of acres produce hay which realises no more than fifty shillings an acre, and yet within the same area soil of the same character produces, under glass culture, crops worth over £1,000 per acre. Professor Long also states that one grower employs some 300 men upon six or seven acres from which, under glass, has been produced in one year 300 tons of grapes, a large proportion of which were sold at 1s. 6d. per lb. At 1s. 6d. per lb. the amount is over £50,000 Another grower made £46 per ton of his potatos between the middle of April and the end of May, despatching to market a ton and a-half every day, and this grower also obtained from one of his glasshouses 80 tons of tomatos, most of which he sold at 1s. per lb. The price would produce £8,960 as the yield from one glasshouse in one season. Another grower cuts in the season between 4,000 and 5,000 cucumbers per day; one set of houses alone last year produced 55,000 dozens. Mr. Long adds that with some knowledge of the crops and the prices it is easy to realise how £1,000 per acre can be made—indeed, he asserts that much more than £1,000 per acre is actually realised. He explains that glasshouses are not the expensive buildings they used to be, and that in many cases the growers put them up themselves.

The November Meteor Shower.—Many horticulturists are almost as much interested in astronomy as in meteorology, and we would remind such that, given clear weather, there will be a grand display of celestial fireworks on November 14, 15, 16, visible from midnight till early morning. This November the earth will be well into the immense stream of Leonids, a stream 100,000 miles broad, and taking us three days to pass through. The constellation Leo is the point to look for as, here the meteors enter our atmosphere, and travelling at the rate of 40 miles per second generate so much heat that they burn, melt, and vapourise ere they can reach our little world.

Copper Sulphate for Dressing Wheat.—As a preventive against attacks of wheat rust several preparations have of late been advocated for steeping wheat seed in before sowing. Copper sulphate is the most commonly used prescription, but it appears that there are preparations in the market which are practically useless for the purpose in view. A case was recently brought before the Royal Agricultural Society where a large wheat grower sent two samples of "wheat dressings." One of these consisted of the genuine and useful blue vitriol, or sulphate of copper, while the other showed the following analysis: Sulphate of iron, 98·75; Prussian blue, 1·06; sand, ·19; total, 100·00 This was merely sulphate of iron coloured blue with Prussian blue, so as to make it look like sulphate of copper, the purchaser no doubt thinking that he was getting the latter, the appearance of which was familiar to him. On making further inquiry Dr. Voelcker, consulting chemist to the society, found that this mixture was sold under the following description: "Finely-ground vitriol, specially prepared as a dressing for wheat." The price paid was 28s. per cwt., that of sulphate of iron being about 4s. per cwt., while sulphate of copper would cost about 20s. per cwt. Unfortunately, inasmuch as the general term "vitriol" is applicable alike to sulphate of copper and sulphate of iron (the former being "blue vitriol" and the latter "green vitriol"), it is doubtful what remedy a purchaser would have. The second preparation was a "colourable imitation" of sulphate of copper; so it is well farmers should be on their guard and horticulturists as well now that sulphate of copper is becoming daily more frequently used as a fungicide.

FLORA OF YUNNAN.

FROM a most interesting letter sent by Dr. Augustine Henry, a gentleman who has done wonders for botanical science in China, to Mr. T. W. Thiselton-Dyer, director of the Royal Gardens, Kew, and published in the current issue of the *Kew Bulletin*, we make the following extracts.

I left Mengtze in the end of January with a caravan of mules, some forty, carrying stores, &c. I had three mule-loads, *e.g.*, of silver. The journey here took eighteen days, rather easy stages. The country passed through was very varied. I was in good spirits, rode nearly all the way, and enjoyed the trip very much. I crossed three large rivers *en route* by pontoon and suspension bridges, the latter very well made, of iron rods joined by rings at the ends, the best specimens I have seen of Chinese blacksmith's work. At these river crossings we reached low levels, about 1,800 feet above the sea, and came into tropical vegetation, which I never find at all interesting. At Yuenchiang, on the Red River, the ugly-looking shrub Calotropis gigantea was in flower, and there was a great display of the tree-cotton, Bombax, in flower, without any leaves, looking like an artificial candelabrum affair more than a living tree. These and some areca palms were the only things of note. At the higher levels vegetation was at a dead point and I collected very little, one or two species of clematis, two rhododendrons: the very curious Scolopendrium Delavayi, which I had never seen before, I found one day on a shady bank where I stopped for tiffin. I also found, at the same place, two plants of Abutilon sinense, which had been sent by me from Ichang, and an Antrophyum, which may be new. I also came across Lonicera Bournei in flower; it is of no value as an ornamental plant. There was very little forest until after Talang, when we passed one or two days through almost continuous pine forest, varied here and there by little woods of evergreen oaks. Here, rather to my surprise, I learned that the peacock exists in the wild state, and it is quite common in the forest south of Szemao. These pine forests had not a plant in flower amongst them. I noticed, however, two little woods made up of an Abies, new to me, but I only found one cone. However, I am not pretending now to give any account of the trip botanically, as it would require too much time to get my notes in order at the moment. On the eighteen days I may have collected about thirty plants in flower. At one or two places I might have done a lot of collecting if I could have stayed for a day or two, but I was travelling on official business, and could not tarry.

Szemao is the end of China. To the south is Chienhung, a collection of little Shan States, dependent on China at the moment, as Britain didn't claim them on taking Burma. The Yunnan plateau is still here and goes on south, if one can call a plateau a collection of mountains rising to 6,000 feet, with intervening valleys averaging 4,000 to 5,000 feet, occasionally widening out into plains of a few miles in width and length. The mountains are being colonised by Lolos and Chinese, while the valleys are in the hands of the Shans, who live by cultivating rice. They are a lazy and immoral people. In the Shan States south and east of Szemao there is a good deal of cultivation of tea, the so-called P'u-êrh tea, concerning which you have published in the *Kew Bulletin* (1889, pp. 118-120, 139 142) a lot of information, mainly gathered by Bourne on his trip here some years ago. This tea is sent to all parts of China and to Tibet. I have an idea that this region is, perhaps, the site of the earliest cultivation of the tea plant; but this section of country was until modern times a Shan principality, and China only extended earlier as far south as the Red River.

There is a good deal of wooded country at no great distance from Szemao, and the mountains run up to nearly 6,000 feet, but there is an absence of the sharp and precipitous kind of mountain and valley, and the flora in consequence is very uniform and not nearly so interesting as Mengtze nor so rich in species. Hills clad with pine and oak are almost barren in interesting plants, and I have not come on any of those dark ravines and steep wooded cliffs which are the joy of the botanical collector. There is a great absence (perhaps the autumn will make a better show) so far of ferns and herbaceous plants. What one collects is mainly trees and shrubs and climbers. There is a fair number of epiphytic orchids. The common plants are not the common plants of Mengtze, in fact the two floras are very different. Szemao will possibly turn out very like the Shan country where Sir Henry Collett collected, and Indian forms not hitherto recorded from China are frequent enough. The commonest tree, after the pine and the evergreen oaks (of which there are perhaps ten) and Castanopsis, is Schima Wallichi. There are four or five laurinæ, a Halesia, a Eugenia, Itea macrophylla, Meliosma, two rhododendrons, a tree Callicarpa, seven or eight species of ficus, a magnolia, to mention the first which come to my mind. Rubus is represented by five species, one new to me; and in China one always expects to meet a new and very distinct rubus after travelling twenty miles in any mountainous part. Rubus ellipticus appears in its ordinary form in the forests with large soft-pointed leaflets. From Mengtze to here and to Talifu a very distinct variety occurs, with smaller, harded, rounded-off leaflets, and this variety occurs in the open country, on poor, bad soil, in dry, barren, exposed places. It is quite evidently a case of adaptation. The variety has rather pleasant, yellow, raspberry fruit, produced in great profusion, and I think it might be of service to gardeners in places where they wanted to grow raspberries on very bad soil in dry, arid climates. In the dry pine and oak woods a cycas occurs, with a stem two or three feet high, but it has not as yet flowered. There is also a fern in the same locality, which I have not seen with spores, which has precisely the same habit as the cycas. The leaves of both are so hard that they can stand, I should think, any amount of drought, and that is necessary here, as little or no rain falls during more than half the year. At Mengtze limestone was the prevailing rock; here it is a red sandstone, and this may account in part for the poorer flora. I have always found limestone to be richer in interesting plants than any other kind of rock. One curious thing occurs here as well as at Mengtze, *i.e.*, the occurrence of two or three species of the same genus in precisely the same locality and often flowering at the same time. There are two climbing loniceras, *e.g.*, here, which are to be met with flowering together. One of the rhododendrons is very lovely; it is a bush some four or five feet high. The flower buds are a delicate red, and the flower just on opening is flushed with pink; the pink disappears, and the flower, three or four inches in diameter, becomes a pure white, except for a dash of yellow on the interior of the upper petal. This dash of yellow on one petal of an otherwise pure white flower occurs in other species of rhododendron. I have not seen a rose as yet, but Rosa gigantea, I believe, occurs. The common Melastoma candidum looks as if it were a rose at a distance, and is almost everywhere. The difference between this shrub and a rose expresses exactly the difference between sub-tropical and temperate vegetation. The latter is in some mysterious way much more beautiful and satisfactory to the eye. I was quite pleased to read the other day in a notice in the *Saturday Review* a savage invective against florists' flowers. It does seem a pity to spoil the simply beautiful flowers by converting them into monstrosities with crested appendages, &c. Of course, as scientific experiments the cresting, doubling, &c., are all right and interesting, and your account of the cyclamen I read with much interest.

The woods near Szemao are full of birds, and the notes are exquisite, and to be heard in perfection in these days of showery weather, for the rainy season has begun. When the sun gets out the cicadas start such a racket that one can hear nothing else. I am afraid there will be no chance here of getting hardy bamboos. Bamboos of that character do occur in the higher ranges of Yunnan, but who is to go there at the time when they are in seed, once every sixty years the Chinese say. I am sorry about the non-success of the lily bulbs; but you have received seeds of the species. I am afraid there will be little here of a hardy nature, but there are a few things of which I shall try to send seeds later. Is it worth while sending seeds of orchids? Yesterday I came across a very peculiar terrestrial orchid, with tiny flowers (half-inch) like beetles. I also found in the same place a little undershrub, about six to eight inches high, with pinnatifid leaves and very long (three inches) cylindric-tubed, rotate-limbed, white flowers. I think it is a curious Solanacea, but I am not certain, as I have not examined the flowers carefully. It would be rather pretty in cultivation. These I found on a bit of cliff which I stumbled against for the first time. There are also two little palms here, which I hope to get in fruit later on. Has Burmannia been in cultivation, any species, with you? There is a species here and at Mengtze, occurring in wet grassy places at high elevations, and the flowers, deep blue, while not very large, are very curious, and a number of plants massed together would be pretty enough. It is a representative of a very small family, and I do not understand what trick the flowers are up to in their peculiar shape. In many of the Mengtze and Szemao trees and shrubs the flowers occur on the branches below the leaves, and not on the peripheral surface of the tree, as in ordinary cases. Many lianas have this peculiarity. These are all forest plants, and I think the explanation is that in forests there are two surfaces open to insect visitors, the top of the forest and the bottom. Some trees and shrubs and climbers can't get to the top, so they have their flowers at the bottom. But of course this explanation is only a guess. There is no time for me to make any observations of the kind necessary; if one could spend six months on end in a forest one could observe, measure, &c. The Mucuna sempervirens of Ichang was a splendid example of this peculiarity. There was in one specimen a dense wall of foliage climbing over trees, interlaced with them, &c., nearly 200 ft. by 100 ft., while the main trunk of the climber close to the ground was covered with flowers which were easily visited by thousands of insects of all kinds. There is quite a little group of shrubs which occur on the banks of rivers (and often in beds of streamlets) that overflow. These shrubs are submerged often, and are not hurt. These *fluviatile* shrubs have a certain facies, very difficult to describe. There must be thirty or forty species of them in the Yunnan river valleys. These shrubs don't occur elsewhere than on banks or in the beds of streams. The last one I have found is a very fine species of Ficus. This class of shrub would be a nice enough problem for someone to work out.

I hope you will try and get a young Cambridge or Oxford botanist to come to this part of the world, do some naturalist work, and collect seeds and live plants for cultivation. China is a very easy country to travel in, and expenses of travelling are not heavy. The mountainous regions of Yunnan and Szechwan are very healthy besides. With regard to San-ch'i (the species of Aralia § Panax), the medicinal plant of which I have sent your herbarium specimens and seeds, I will try and send a note on it for the *Bulletin* by next mail. It would be a favourable opportunity, if one of the staff had time, to go through the section and make a little synopsis of it. It includes the American ginseng plant, Corean ginseng, and two or three other species, and I found some forms of Ichang which were not worked out. The forms seem to run into each other in a puzzling way. It is very curious that the Chinese should have selected two forms—one in the extreme north of the empire (Manchuria and Corea), the other in the south, near Mengtze—as two most powerful and famous drugs. There is something peculiar about the history of certain drugs which European doctors consider useless. Take sarsaparilla and china-root, species of smilax, much believed in by native American races and by the Chinese. With regard to benzoin, it is not known here; but our Consul will probably take a trip by and bye down into Siam, and I will try and induce him to make inquiries for the tree. Have you tried writing on the subject to the British Consul at Chiengmai in Siam? The Yunnan plateau is apparently continued into the Shan States, and teak, benzoin, &c., are probably confined to the lower levels lying south. I have some specimens—only leaves—of the tree which produces the very valuable cinnamon of the Laos, but I am afraid they will not help much in clearing up the species. They were brought to Mengtze by a pedlar after I had left the place. I have said nothing in my letter about recent events in China, but they are very important. It is impossible to believe that China will remain hopelessly stagnant, and that she will make no effort to cope with these disastrous times. The Chinese are just as clever as the Japanese; they are wonderfully homogeneous; there are no class or race hatreds as in India. Waking up is slow, very slow, but it must come. In such places as this letters are esteemed more than gold, more than tobacco—they are the only little joys we have. It is very hard to live in such places as this, and we only go through it by the aid of letters and a certain doggedness which is acquired by practice. Russian officers in similar stations in Siberia commit suicide at the rate of five per cent. annually, I have been told.

Cassia corymbosa.—I was delighted to see a good plant of this beautiful yellow-flowering greenhouse plant in bloom the other day, and to my mind we have nothing like it so easy to cultivate, or producing such bright flowers in the autumn. Why is it we lose all these good old stove and greenhouse plants, and cannot something be done to bring these old favourites into prominence again?—J. L. P.

Some Recent Yellow Chrysanthemums.—How rich and beautiful in tone are some of the yellow chrysanthemums introduced during the past two or three years, and from a decorative point of view it is difficult to say which are the best, individual taste alone must be the guide. For form and beauty combined I cannot help awarding the palm to Mrs. W. Mease, and next to that comes G. J. Warren, several tones deeper. Miss Mary Underhay is a lovely pale yellow of great purity, and, of course, Edith Tabor and Ella Curtis will need no words of praise to commend them. Le Grand Dragon is a beautiful shade of deep golden yellow, and is a true Japanese. Mrs. Ernest Carter is a lovely deep primrose; Oceana and Modesto are now generally known and admired. Some of Calvat's yellows are specially noteworthy. Who has not seen and admired Pres. Bevan, large and incurving; M. Fatzer, General Paquié, a lovely warm golden bronze; Sécrétaire Rivoire, pale canary; Tatiana, all of this year's set? While last year's lot comprises M. Massange de Louvrex, President Nonin, Soleil d'Octobre, Topaze Orientale, a beautiful large type of purely incurved flower. R. Hooper Pearson is one of the biggest and deepest, a rich, deep, velvety golden yellow with a lighter reverse; Archie Ray is not large, but it is a very delicate shade of primrose, a sport from Mdlle. M. A. de Galbert. Mrs. A. Cross is of the deep golden hue; Comtesse de Boulaincourt, Mrs. L. Humphrey, Mrs. J. W. Barks, Hugh Crawford, Lady Oporto Tait, Princess Charles of Denmark, and many others give a wide scope for selection.—C. H. P.

WORK AMONG POT ROSES.

THE early part of November is a particularly busy and important time among pot roses; whether it be the potting up of fresh plants from the open or shifting on those already in pots. The batch of plants for early forcing also needs attention, and those intended for flowers at Christmas must be on the move at once. Even where pot roses have been well watered and cared for the past dry summer has ensured more than usually well-ripened wood, and there are very few plants that will not be in excellent condition for forcing. It is an excellent plan to examine all pot roses at this season. Those that have been standing in the open will need their drainage made efficient, and should be given some slight shelter from excessive rain and frosts. A very little cover or protection will secure this, and there could be no better place than a deep pit or frame, over which the lights could be placed as occasion requires. But many are short of such cover; and even where it is possessed there are several subjects needing it more than pot roses intended for late use. We have found a few hurdles, with some branches of birch, fir, or gorse interwoven, a capital and efficient protection when some loose framework is erected over the roses. They are quickly and easily removed, and last a long time.

We are, however, more concerned at present with pot roses needed for immediate forcing. I am aware that the majority of gardeners prefer a pot rose to be well established in the same pot it is to flower in. This does not recommend itself to us, and, after many years' experience, we have decided to repot all roses before forcing. Let me give the reasons for this. A plant that has become completely pot-bound must necessarily have exhausted the compost. One need not fear that any disturbance of root will interfere with the flowering properties of wood made under those conditions. So long as the wood is well matured, and the roots not unduly disturbed, the plant will flower quite as freely and with as much certainty as if forced in its pot-bound condition. It is very different to plants lifted afresh from the open, in which case we lose many roots, and have none that are established in the soil. On the other hand, our pot plants have the bulk of their roots undisturbed, and when we afford a little fresh compost new roots are made more freely, and feed the plant to much better effect than can be the case with artificial manures only. I am not alluding to large plants and pots, comparatively few of which are grown in these days, but the majority of our pot roses for conservatory decoration and winter cut flowers. We cannot continue to repot very large plants; they must have an occasional shaking from the soil, and be replaced in the same sized pots as before, feeding them in the meantime by mulching and liquid manures. It may be said that this is simply what is done when smaller plants are treated without repotting; but I contend that to give them a little fresh compost is the better plan of the two. We know how very quickly rose roots respond to a little heat, and how quickly new roots are formed when plants are laid in fresh soil, even in the open ground. Then why not give them the same encouragement under glass, and the needed fresh food at the same time?

To my mind there are no better roses for early forcing than those which have been growing in five or six inch pots, and well ripened in the open air during summer. We do not need a large quantity of wood—a fair amount, and that efficiently matured, is ample. I am not alluding to climbers, but such free growers as Niphetos, Madame Falcot, Catherine Mermet, and the like. Turn them out of the pots, remove as much as possible of the old soil without seriously disturbing the roots, and repot, using the following compost, or one as nearly like it as your conveniences will allow: turfy loam one-half, thoroughly decayed vegetable refuse and leaf-mould one-fourth, and the same of well decayed stable or farmyard manure. Roses do not need much drainage, but what is given must be efficient. Place a little of the coarser compost over the drainage, and set the ball of roots upon this. We should thus have the bole of the plant half an inch or so deeper than before. Give a double shift, *i.e.*, pots two sizes larger than the rose previously occupied. On no account should the compost be passed through a fine sieve or riddle; one with an inch and a-half mesh is quite small enough. As a rule our own compost is not passed through a sieve, but is chopped up with a spade and bricklayer's trowel. Be sure that the bole of your plant is not over dry when potting, and make the compost firm all round it.

With climbers intended to flower in pots we need as much as possible of last season's wood; and here a strongly grown plant is an advantage. I should shift these on just the same as already noticed. Really good plants of Maréchal Niel, William Allen Richardson, and others can be had in six-inch pots, generally carrying from one to two rods of well-matured wood. An eight or ten-inch pot suits these. Such climbers have invariably been forced on, and cannot fail to exhaust the soil in a six-inch pot. I have never had blooms of so good a quality from plants forced in the same root-bound pot they grew in the previous summer as when a shift and fresh compost has been given. We do not disturb the roots sufficiently to cause blind growths from the long rods, but give the plant something to feed upon during the excessive strain climbers are put to when producing a flower from almost every eye upon a six or ten feet growth. After potting place the roses in a cool pit or house, keep rather close for a time, and prune about three weeks later, when taking them to slightly warmer quarters. One need not fear to prune teas fairly hard. Do not cut back old wood, that should have been done during summer, when necessary, but cut back the new lateral growths of Niphetos, Souvenir d'un Ami, Maman Cochet, and others to within two or three eyes of their main branches. The climbers will only need their extreme points removed. It is a great mistake to hurry roses at the start. When once they have received a forcing temperature of 65 to 70 degrees, it must not be allowed to fall much lower. After the flower bud is visible they may be hurried on, if needed, but not with safety before this point. Although repotted, weak liquid manures will help very much after the roots are well at work among the new compost.

[illegible] A. PIPER.

WINTER-FLOWERING BEGONIAS.

As the tuberous-rooted begonias pass out of flower after a long season of bloom, the fibrous-rooted species and varieties may be utilised to take their place to a certain extent, especially where a warm greenhouse or intermediate house exists. The blooms, although not individually so large as those of the tuberous-rooted section, are yet to be counted among the most showy and effective of our winter flowers; so, with the numerous hybrids now to be obtained, a display of handsome flowers and foliage may be maintained throughout the winter months.

Amongst those in flower now are Begonia coccinea, more generally known as B. corallina; this is decidedly one of the best of its class, a strong grower, with stout stems and green leaves with a reddish margin; both specific titles describe its flowers, and it may almost be called a perpetual bloomer. The now well-known and deservedly popular B. President Carnot also belongs to this class of strong growers, carrying inflorescences almost a foot across; all the male flowers drop from these, leaving the large pistillate blooms with their very large and brilliant ovaries. Begonia Teuscheri is also a tall grower, with stems six to eight feet long, carrying large foliage, deep green above and reddish beneath; the flowers are of a pinkish-red colour, and are now expanding. B. undulata is a dull white-flowered species which makes a break between the bright-coloured begonias noted above; the foliage has undulated margins. All the foregoing begonias are best grown planted out either in beds or, better still, planted in some good soil under the stages, when the strong bamboo-like growths may be brought up at the back and trained under the roof in a cool stove or intermediate house. If this method be adopted, little trouble will be given, and a good supply of flowers obtained and effectively shown.

B. fuchsioides is another good plant of this kind, but suitable for a cool greenhouse. This species is a native of New Granada, grows to a height of eight or more feet, and is covered with quantities of small green ovate leaves. The drooping panicles of flowers are rich scarlet in colour, and commence to expand during October. Another good subject for greenhouse cultivation is B. metallica, the specific name applying to the foliage, which is large and decorative; the axillary inflorescences are composed of pinky white flowers of large size. B. nitida, if kept growing and planted out, will also give abundant supplies of its large flowers. B. manicata is perhaps one of the most free-flowering, producing, if planted out, stems about four feet high and an inch in diameter; these bear huge panicles of pink flowers. It is a Mexican species, and a good stove plant. The hybrid raised from this and another species, viz., B. Paul Bruant, is also a good plant of like character, with dark-coloured foliage of a rather metallic hue, and trusses of bright pink flowers. B. Dregi is a useful plant for pot culture, making pretty specimens about eighteen inches high in small pots; the foliage is of a delicate light green, flowers white.

Perhaps the Socotran species, B. socotrana, is among the most interesting as a winter bloomer. The leafage, borne on short stems, is peltate, and of a light green colour, while the bright rosy-coloured and large flowers are always attractive, lasting for a week or more. The hybrid raised from this and B. Dregi is now probably more grown than almost any other begonia, and undoubtedly B. Gloire de Lorraine is a most useful and pretty plant. Shapely plants may be secured for flowering from November through the winter if struck in the late spring and kept growing in an intermediate temperature. Plants in five or six-inch pots cannot fail to command attention, and such should be grown in all collections for winter decoration. B. Knowsleyana is valuable where cut flowers are in demand, being a good grower and free bloomer, the flowers being pinky white. Another good pot plant is B. Ingramii, with flowers of a reddish tint, and deep green, small foliage. For the greenhouse a pretty small-growing species is B. geranioides, a native of Natal. The root stock of this plant is tuberous, the reniform leaves rise about six inches from the ground, and are light green in colour, and densely covered with hairs. The white flowers are borne on peduncles that rise above the foliage. Many other begonias are in cultivation, which may be grown if required, but the above are amongst those most useful for general purposes, and when well cultivated are always attractive.

Royal Botanic Gardens, Edinburgh. R. L. HARROW.

The Drill Hall Meetings.—I often wonder whether there exists anywhere in the world gatherings that at all resemble, not merely in connection with horticulture, but with any other great vocation, practice, or science, those so regularly held in the Westminster Drill Hall by the Royal Horticultural Society. Ordinarily habitués may look upon these meetings as very commonplace things, but then, if so, that feeling arises solely from not being invited to take a philosophical view of them. But propound to the most stereotyped visitor the question, "Are not these meetings, after all, most remarkable and wonderful illustrations of the wide-spread devotion to horticulture which exists in Great Britain?" and the soul of the materialist is at once aroused, and he admits that so regarded they are. I fear horticulturists at large do not sufficiently value them all the same; and certainly the general public, perhaps from lack of knowledge of their existence, do not. Now, it is an undoubted weakness of all ordinary shows that we know pretty well beforehand from previous experience just the nature of the exhibits that will be presented to view. In the case of the Drill Hall meetings—and we may write of them ordinarily really as exhibitions—we never know beforehand what we shall see at them. Most certainly we do see the very best of everything horticultural the kingdom, nay, almost the world, can produce. There is no privilege any gardener of any description can enjoy that is greater than being enabled to attend these meetings frequently, and no greater honour can be bestowed on anyone than to be a member of one of the R.H.S.'s committees. The more I see of the society's workings, and of its meetings and general proceedings, the more do I realise that it merits at once the confidence and support of the entire community. —A. D.

PLUMS FOR NORTHERN COUNTIES.

If wall space can be set apart for plums, a crop can usually be secured even at Alnwick. If space is limited, only the very best kinds should be grown. We find Early Rivers useful on south walls, but it is very small though a free cropper. Oullin's Golden Gage is an exceptionally useful kind; we gathered it on August 13 from a south wall, and as dessert fruit is scarce at that date it is the more valuable. This variety will crop in about four years if the young trees are lifted once. Some varieties of plums will take double that time before a crop can be secured. I would specially emphasise the importance of lifting young plum trees after they have been planted three years, if they grow very strongly. The largest roots should be cut off, and all the small fibrous ones retained. The latter should be laid out carefully in healthy but unmanured soil, otherwise extra strong shoots will again be produced. Plum trees need much care in training during the first few years, so as to have the main branches covered with fruit spurs. When cutting back the leading shoots at the winter pruning, it is a good practice not to leave more than fifteen to eighteen inches of the last summer's growth, as this will tend to force the back buds to form spurs. If a greater length than this is left the back buds will not grow, and consequently the main shoots will show blank spaces. It is always best to hasten slowly in covering walls with plums. We have trained many fine young trees here during the last sixteen years, and they continue to fruit on the lower branches right back to the stock, nearly as well as on the upper branches, where naturally the sap flows most freely. Aphides have done the trees some damage this season, and both plums and peaches should be syringed with safe insecticide before the flowers begin to open in spring, so as to destroy the earliest breeding insects, and prevent much damage by them during the flowering and setting time.

The Victoria is our best cropping plum; indeed, great care is necessary to prevent over-cropping with this prolific variety when it has been carefully planted in healthy soil and trained as described. The trees here have cropped regularly for the last twelve years, and sometimes carried heavy crops. To ensure a regular crop of high class fruit annually we mulch with cow manure early in the spring and also use artificial manure freely, affording abundance of water in dry seasons. The Victoria is commonly used as a dessert plum, and the choicest fruit, if carefully gathered, is of very good flavour, very little inferior to Jefferson and Kirke's. When training the Victoria on walls it is important to lay in young wood annually, as many of the spurs on the main branches die out after maturing a heavy bunch of fruit, and leave spaces with no spurs. Therefore the best-placed young shoots should be laid in and shortened back at the winter pruning. This is done to a less degree with other varieties, but these rarely produce such heavy crops as the Victoria.

We find the Jefferson plum a good regular cropper on south walls, and about a fortnight later than Victoria. Kirke's is another that should be grown where room can only be found for a few of the best. It rarely fails to produce fruit. We have some parts of our trees heavily cropped, and other parts with scarcely any fruit this season; but usually there is a nice even lot of fruit. Lawson's Golden Gage is usually a good cropper, but is not so this year. We have Green Gage on trial again, a variety that crops well in some parts of Scotland. Then there is that indispensable plum, Coe's Golden Drop, the latest dessert plum, but one always difficult to set well, even with every care. Perhaps some day a Rivers or someone else may give us an improved free-setting Coe's. This would be a great acquisition.

There are large demands for plums throughout the autumn, and we feel very keenly the lack of variety of fruit, so take the greatest possible care to plant varieties that will give a succession over as long a season as possible; these must also prove regular croppers. Many kinds will not answer here, so we disregard them, and advise others to do likewise. I have only noted those that have given the best results over many years' trial, and this information to any person desiring to plant thus far north is of value, for it is vexing after ten or more years' careful training to have to discard a tree. In this cold district we also feel more than anyone the necessity of having fruit trees true to name.

Plums planted in orchards carry practically no fruit here this season, but several varieties are generally worth planting, and Victoria stands first, producing heavy crops most seasons. Monarch, Czar, and Prince Englebert, with the damsons, yield heavy crops. We have some of the Japanese plums on trial. In conclusion, I would not advise the planting of Pond's Seedling and Magnum Bonum plums so far north as this, unless in very favoured localities.

Alnwick Castle Gardens. GEORGE HARRIS.

Own Root Roses.—A simple way of propagating own root roses may be practised during the next few weeks in the open. A sheltered border with a west aspect should by preference be chosen, and if the soil is light further preparation is unnecessary. Select cuttings of moderate strength from well-ripened shoots from six to nine inches long, and if these are inserted firmly a good percentage will form plants by the spring. In making the cuttings, the eyes or buds should not be cut away from the end inserted in the border, as strong shoots may start from these later on. After the site has been forked over and trodden firmly, the quickest way of inserting a quantity of cuttings is to chop out a shallow trench almost perpendicularly across one end, and lay the cuttings in about six inches apart, treading the soil firmly against them, and continue in this way until all the cuttings are inserted, the rows to be nine inches asunder. If a small quantity are to be inserted, a dibber may be used instead. Many varieties of H.P. roses strfke readily in this way, as also does the Crimson Rambler and most of the climbing roses, and others of fairly strong growth.—C. HERRIN, *Dropmore.*

THE RAINFALL AND THE CROPS.

Having recently returned from a few days' holiday to the South of England, part of which was spent at the great exhibition of British grown fruit held at the Crystal Palace, and the remainder in visiting some of the noted gardening establishments in the neighbourhood of London, I was much impressed by the great difference that at present exists in regard to moisture and the state of vegetation in the district mentioned and in Scotland. In the former the ground at the time of my visit was everywhere parched and hard for want of rain, and nearly all kinds of vegetables were suffering severely, and much apprehension was manifested by cultivators as to the winter supply of green stuff and root crops. In market gardens the crops of cabbage, broccoli, and cauliflower had a very distressed appearance, while carrots and beetroot presented a most unusual sight at this season, the roots being small and the foliage drooping upon the soil, and it is doubtful whether heavy rains would benefit these to any great extent. In private gardens the spectacle was not much better, for the crops mentioned were in many instances almost a failure, and the seed of spinach, turnips, and other autumn crops had failed to germinate, or the crops were very thin and weak. In this case the area of the crops being smaller, watering had to some extent kept things going, but the supply of this in some places has failed, or only sufficient could be allowed for the more pressing requirements of the garden. Trees and shrubs have also suffered very much, and many of the former, especially beeches, were almost leafless, while many of the commoner shrubs in suburban gardens or in situations where the soil is shallow were in such a flagged condition that it seemed doubtful whether they can possibly recover.

The contrast between this state of things and that obtaining in the South-west of Scotland is a wide one. Here an abundance of rain has fallen throughout the whole time that the drought has been most severely felt in England, and as the weather has been exceptionally bright and warm for this part of the country at this season growth has been very rapid, and vegetables are very abundant and good in quality. At this date (October 13) peas, beans, and marrows are giving good returns, as sufficient frost to damage them has not been experienced. In the flower garden begonias are flowering profusely, while dahlias and many of the herbaceous plants have grown to an unusual height, and are flowering with great freedom. As some among your numerous readers are interested in the rainfall, I give below the records for the past three months. The month of July was the driest of any summer month for the past twenty years, as only ·40 of an inch was registered. Between August 1 and 12 4·20 inches fell, and on two occasions, the 5th and the 10th, over an inch was registered, the total for the month being 6·44 inches. September had twelve rainy days, which produced in the aggregate 4·16 inches. The total rainfall during the nine months of the year ending September 30 amounted to 25·9 inches, which is a little below the average of former years.

Galloway House Gardens, N.B. JAMES DAY.

ERYTHRINA CRISTI-GALLI.

Seldom does one see this handsome plant, popularly known as the Coral Tree, to such advantage as was the case of some specimens I recently noted. They were conspicuous for their size, fine growth, and gorgeous flowers, which were produced in great profusion. Although generally treated as a half-hardy subject, it was interesting to find that in the neighbourhood of Woking the species is perfectly hardy; those seen having withstood the winters of the past five years with no other protection than that afforded by a slight covering of coal ashes. When we remember this species is a native of Brazil, this is all the more remarkable. Its culture is of the easiest. To ensure strong growth and freedom of flower a sunny position is requisite, as well as abundance of water during the growing season. It is by no means particular as to soil, although a strong loamy one is to be preferred. If desirable to increase stock, cuttings of the young shoots will root readily, if taken in spring, inserted in pots in sandy soil, and placed on a gentle bottom heat; so treated they will make fine plants the same season. The flowers are borne on long terminal racemes, and are deep, dazzling scarlet in colour. The leaflets are oval, glaucous green in colour, and the leaf stalks or petioles are glandular and prickly.

Erythrina cristi-galli was introduced from Brazil in 1771, and was described in the *Bot. Mag.*, t. 2,161; by some authorities it is called *Erythrina laurifolia.* The species possesses several forms which are sometimes seen in our gardens, all of which are well worth growing. Probably the finest is E. c.-g. ruberrima, with very large flowers of a brilliant crimson colour, with a pleasing rose shade. Erythrina c.-g. ornata has very dark vermilion flowers, and is useful as a contrast. E. spectabilis is exceedingly useful, its leaves being marked and splashed with yellow, rendering it a most conspicuous subject; while E. c.-g. Cottyana has flowers of a deep rich reddish shade. The species and its several forms are deserving of more extended cultivation than at present afforded them, as their easy culture and free-flowering qualities entitle them to a place in every garden, flowering as they do late in the year.

Woking. E. S.

Laxton's John Howard Pea.—I have grown this fine new pea two seasons, and without doubt it is one of the best of the Laxton introductions; it has a strong branching habit, growing with me about four feet in height, and producing pods in pairs, well filled with about eight or nine peas of good size and of a distinct flavour from any other pea of the marrow type. It is a variety of the Ne Plus Ultra section, with short blunt-ended pods, and the seed peas very much resemble those of Ne Plus Ultra. In my opinion John Howard will become a general favourite.—J. L. P., *Norfolk.*

CHRYSANTHEMUMS AT THE NURSERIES.

Mr. H. J. Jones.

THE Ryecroft Nursery, over which Mr. H. J. Jones presides with so much business energy and skill in cultivation, has long been renowned for its very comprehensive and well-kept collection of chrysanthemums, as evidenced at all the public exhibitions by the very charmingly arranged groups which in late years have excited so much attention, the excellence of which may be attributed to Mr. Jones' visits to the Continent, where so much talent is displayed in setting up similar groups. At the present moment the Ryecroft collection, which Mr. Jones tells us has in no way suffered from the plague of rust that is troubling so many of his countrymen, is in full burst of colour. The plants are well arranged in three large houses, and, as usual, comprise novelties from all quarters of the globe.

Although great attention is paid to home-grown seedlings, the French, perhaps, claim the greater share of attention, and of these the seedlings received from M. Ernest Calvat include a grand-looking incurved called Topaze Orientale, beautifully built, very deep in form, and of a pleasing shade of clear pale yellow. François Coppée is a deep golden shade with long florets. President Bevan, a noble flower of its type, is big and massive with numerous narrow grooved florets closely incurving and of a deep golden-bronzy shade. Marie Calvat is rather rough and loose, a long-petalled Japanese, colour white faintly tinted. Le Grand Dragon is one of this season's novelties, very fine long florets, drooping and of medium width, a rich golden orange-yellow faintly streaked with red. The green novelty, Madame Ed. Roger, is curious, and Sécrétaire Rivoire, a Japanese of pale yellow. One of the noblest and best of Calvat's 1898 seedlings is M. Fatzer, a Japanese of great size and substance, the colour a deep rich pure golden yellow. Mélusine is white, streaked purple, large but not very taking; the same cannot be said of General Paquié, which has flat recurving florets and is of a very pretty and distinct shade of golden terra-cotta. President Nonin is another, somewhat similar in build and colour. M. Hoste is older, a large white Japanese tinted purple.

Some of the Colonials here, as elsewhere, do credit to the raisers in the Antipodes, who seem to understand the kind of flower most likely to appeal to English tastes. Oceana, Australie, and Pride of Madford are all well known, and to them must now be added Chatsworth, a fine deeply-built Japanese of pale pink; Mrs. H. Briscoe, a large Japanese with long florets, colour pretty rosy mauve with reverse of silver; Miss Mary Underhay, one of the finest and best, and of a lovely shade of rich buttery yellow; an incurved Japanese Beauty of Adelaide, long florets, colour rosy pink; Nellie Pockett, white; and Miss Vera May Fraser, a charming shade of golden terra-cotta with a golden reverse.

Here there is an unquestionable difference in the two yellow Carnot sports. Both are grand blooms, but G. J. Warren is certainly several shades deeper in tone than the pale primrose yellow of Mrs. W. Mease, which, to our taste, is by far the more chaste and pleasing. Mrs. W. Popham is big, solid, and substantial, a Japanese incurved, very deep in build, colour pale purple with silvery reverse. H. T. Wooderson, of the same section, close and compact, colour bright deep rosy pink. In yellows, Lady Oporto Tait is large, and Mrs. Maling Grant, different in form, is deep golden buff streaked bronze; Princess Charles of Denmark is golden yellow, James Brooks another, and Mrs. J. W. Barks is a fine bronzy-yellow sport from Edith Tabor. Very deep in its own peculiar shade of shiny, glistening golden yellow is J. Hooper Pearson, a Japanese with rather broad-grooved florets. Lionel Humphrey, of the Japanese type, is large with flat-drooping florets of great length, colour deep crimson chestnut with a golden reverse. Robert Powell, Julia Scaramanga, and Vicar of Bray are but varying and deeper shades of the primary colour of our popular flower.

Not large but very pretty is the graceful pale pink Mrs. F. A. Bevan, and Mr. Peter Keary, a Japanese with drooping reflex florets, and of a fine shade of velvety purple, reverse silvery, is also most attractive. A deep golden yellow sport from the well-known Edwin Molyneux ought to be a good thing judging from its present appearance, and for richness of colour Royal Standard, a striking bright crimson and gold Japanese, is at once effective and rich. A few others of the best are Mrs. A. J. Baker, large and globular, narrow florets, curly at the lips, colour pure paper white; Duke of Wellington, big, solid and globular, a Japanese incurved, with broad florets of rich golden bronze; Mrs. L. Humphrey, large Japanese, colour pale primrose or canary yellow; Lady Hanham, Mr. A. Barrett, quite distinct from Mrs. G. W. Palmer, the sport from Mrs. C. Harman Payne, and several others in which perhaps individual taste will play a large part in allotting the position they should occupy hereafter.

Miscellaneous Continental and other sorts are well represented by Chrysanthemiste Bruant, a big golden chestnut bronze Japanese incurved; Madame Leon Teyerick, deep golden ochre yellow, with broad florets, forming a good Japanese incurve; Rayonnant, an exaggerated and finer Lilian B. Bird; Miss M. Donaldson, a true Japanese of a delicate shade of pink, pretty, but not over large, and Dr. Noel Martin, a creamy white Japanese. Others, such as Emile Nonin, golden chestnut, incurved; Comtesse de Boulain Court, yellow Japanese; Abbé Brosson, large white Japanese; Fleur de Lilas, pretty rosy pink, medium size, and a few more are not commonly met with but deserve to be mentioned.

In conclusion, the novelty hunter may do well to keep a look out for such as M. Caillebotte, purple amaranth, Sita, Tatiana, a fine yellow La Marcadion, incurved reddish chestnut and golden buff, upon whose merits it is perhaps premature at present to pronounce.

The Framfield Nurseries.

Of the many nurserymen who specially identify themselves with chrysanthemums, Mr. Norman Davis may fairly claim to be one of the most enthusiastic. The nurseries at Framfield are extensive, and contain a number of lofty and spacious glass structures, splendidly adapted to the flowering of a large collection of chrysanthemums. Vineries and smaller houses are all turned to the best account in several ways, and are both interesting to the visitor as well as a source of profit to the owner. Second only in importance to the enormous business carried on in the distribution of cuttings and plants of chrysanthemums is the growing of fruit and flowers for the wholesale markets. The fine crops of [illegible] and Black Alicante grapes were quite a feature of this work. Tomatos are grown in immense quantities, and early in the year green peas form one of the crops under glass, which give much satisfaction Hardy herbaceous perennials, too, are well done, and most interesting of these at the time of our visit were the charming Starworts or Michaelmas daisies. The collection is one of the best, including only those species and varieties which are really worth growing. The splendid exhibit of these from Framfield at the recent October show of the N.C S. illustrated most forcibly what grand subjects the asters are for autumn display in the open border. Those still looking bright and fresh were A. Coombe Fishacre, A. ericoides, A. amellus, in several distinct forms and colours; A. vimineus, A. cordifolius, and a very charming variety of the latter called Diana; A. tradescanti, A. turbinellus, and A. oblongifolius; these have all done remarkably well. The great drought seems to have had no ill-effect on them at all; several varieties of the Novi Belgi section have been rather smaller in the individual flowers than usual, but have all flowered most profusely. New and improved forms are much in evidence. The best is a fine variety of A. amellus called Framfieldi. The flowers of this truly handsome daisy are much larger and brighter than in the type, but its chief value lies in the fact of its being a month later than the ordinary stock of amellus. Other good novelties are A. Mrs. F. Rayner, a very bright rose-pink; and Mrs. C. W. Earle, a most delicate shade of pale lavender.

Early chrysanthemums in the open border are later in blooming this year than usual, some varieties being quite a fortnight later than last season, and several of the new varieties do not come up to expectation. It may be that the abnormal heat and drought has been the cause of this. Such old favourites as Foucher de Cariel, Harvest Home, Ivy Stark, Ambrose Thomas, Flora, Madame Eulalie Morel, Piercy's Seedling, Mrs. Cullingford, Madame Marie Massé, O. J. Quintus, Samuel Barlow, and Queen of the Earlies are amongst the finest. M. Gustav Grunerwald and its several sports are not first-rate; after flowering in fits and starts during summer they grow straggling and weedy just when they are most wanted.

The indoor early sorts are grown in enormous quantities. A special favourite seems to be Lady Fitzwygram; over two thousand plants are grown of this, its pure white blossoms being in great demand. Barbara Forbes is a splendid market variety, and five hundred plants of Ryecroft Glory are very fine, the colour on many of them being almost red. A peculiar feature of all the plants grown here is the beautifully bright and clear colours developed throughout. Many thousands of later varieties, grown entirely for market, promise to recoup well for the extra labour devolved during the past dry summer.

Coming to the exhibition varieties, the chief attention is evidently paid to novelties and seedling plants. The older and less important varieties are, from a specialist's point of view, perhaps scarcely so good as last year on the whole. The scarcity of water has perforce put the commoners on short rations. When it is mentioned that only two days' rain fell from March until the recent change it is surprising that the plants look so well as they do. The most striking feature of the present show lies in the magnificent array of Madame Carnot and its sports. These are arranged the whole length of a house two hundred feet long, and look most promising. The later buds will probably give better blooms this season than usual. Another favourite here is Western King, of which there are over one hundred plants, all perfectly healthy, and swelling up clean and promising buds; these are all terminal buds, which is the only way to obtain the clean, broad florets and finely built flowers such as Mr. Davis has shown so well during the past three years. Soleil d'Octobre is a splendid yellow in its season, and fine blooms were to be seen, also some enormous mops of Madame Gustav Henry; this latter is so easy to grow that anyone may produce large blooms, though the quality of the flowers is not of the best.

Amongst the novelties of the season which promise well are R. J. Upton, a beautiful dwarf yellow, having very large buds just opening, of a shade deeper than Australian Gold; it looks like proving a sensational variety. Ed. Spurge is a seedling of an intense glowing crimson colour, and will probably be a good thing. Madeline Davis, which was so fine a seedling plant last year, will probably make its mark; the colour is charming, here it is pearly white, delicately tinted and flushed violet. A magnificent large incurved, at present unnamed, is opening well, and will no doubt soon be placed before the Floral Committee. There are scores of most promising seedlings; but it is rather early for a fair judgment of their merits at present, and a careful and exclusive selection will be made to avoid disappointing growers with novelties that are not desirable, or which have no merits beyond existing varieties. Mr. Davis makes his list of novelties as concise as possible, recognising the bewildering effect which lengthy lists of names and coined adjectives of the superlative order have on those who would fain rely on the plain English, so desirable as a guide in the purchase of new varieties. Joseph Chamberlain promises to sustain the reputation which the raiser gave it last year, though on very early buds it may be disappointing. The long-expected white Viviand Morel has been found in Mrs. Ritson; of some sixty plants grown here every flower is opening pure white, and on late buds, too.

Several of Calvat's novelties are likely to sustain this raiser's high reputation. Le Grand Dragon is an intense yellow, and Marie Calvat is a variety possessing every good feature. General Paquié is a large orange and red coloured flower of excellent form, and will be much sought for. Others very promising are Chatsworth, Pride of Stoke (the sport from Pride of Madford), George Foster, Madame A. Rosseau, Mrs. C. F. Payne, Master Tucker, Sécrétaire Fierens, and W. Towers. These are amongst the most advanced; a few weeks hence and there will be many others worthy of mention, and also of note, by those who would be up-to-date in their selection of novelties.

Claremont Nursery, Woking.

An old exhibitor, and one who has made a name for himself in many a competition, is Mr. H. Shoesmith, who is now in business on his own account at the Claremont Nursery, Woking. We paid him a visit there a few days ago to see what attention was given to the famous November flower with which he is so familiar in all its details, and were pleased to find a very nicely grown, well-assorted collection of everything that was good and novel from the exhibitor's standpoint.

The old florists' type of incurved was, and evidently still is, a favourite with Mr. Shoesmith, for we noticed some very finely grown samples of such standard sorts as Queen of England, Empress, Lord Alcester, Mrs. Heale, Mrs. Coleman, Miss Dorothy Forster, C. H. Curtis, Princess of Wales, &c. Anemones and pompons here, as is the case almost everywhere, are not grown in any quantity for display, and our observations which follow refer exclusively to varieties of the ever-popular Japanese section.

Among the recently introduced Australian seedlings John Pockett is a good, sized Japanese incurved with long pointed florets, reverse golden bronze, and among others from the same part of the world the solid, massive Australie, Oceana, and Pride of Madford, all well known to growers, and are certainly of considerable merit. The selection does not, however, end with these, for we noticed a very pretty bright crimson sport from Pride of Madford, called Mabel Kerslake, Mrs. Ernest Carter, big and fine, with long drooping florets, colour clear deep primrose, Mr. T. Carrington, deep rosy amaranth, and the Convention, golden bronze. Special mention ought to be made of Miss Mary Underhay, a beautiful clear pale yellow, Master H. Tucker, bright crimson and bronze, Chatsworth, pale pink, Miss Nellie Pockett, white, recently certificated, and Mrs. Ernest Carter, very fine deep primrose, all of which come from the Antipodes.

Selections from some of the most promising of the continental varieties of recent importation must necessarily include a special mention of M. E. Calvat's seedlings, of which Madame [illegible] de Mauny, a Japanese, of a velvety purple amaranth shade, and a silvery reverse; N.C.S. Jubilee, Japanese incurved, pretty silvery pink; Sécrétaire Rivoire, a Japanese with long drooping florets, colour pale canary yellow shaded bronze; Madame Bertet, pure white tinted flesh colour, are all fairly good. Among others from the same source of special merit may be counted monster blooms of such varieties as Dr. Liebert, globular and deep, colour bright rosy mauve with silvery reverse; Australian Gold, Madame Carnot, the curious green Madame Ed. Roger, Le Grand Dragon, a fine new golden yellow of this season; Madame Couvat de Terrail, a big spreading Japanese of a pale pink, passing to white; Madame Madeleine Expulson, a new white; Melusine, Tatiana, Antoinette; Sita, white streaked purple; M. Chenon de Leche, Werther, and one or two more.

Well-known standard sorts are also found in good examples of Mrs C. Harman Payne, very large and bright in colour, and in its two sports, M. Louis Rémy and Mrs. G. W. Palmer. Madame Rozain is a grand incurving pink Japanese, not a modern one, but still of some value. There are some good blooms of Viviand Morel, Etoile de Lyon, Phœbus, and others from various Continental raisers other than M. Calvat.

Home-grown and miscellaneous varieties are seen to advantage in Col. W. B. Smith, Modesto, Edith Tabor, a beautiful colour and finely formed; Ella Curtis, very large; Lady Ridgeway, Lady Isabel, pale silvery pink; Robert Powell, Simplicity, and Joseph Chamberlain; while several of the recent sports from varieties of acknowledged merit are represented by excellent blooms of Lady Hanham, Charles Davis, G. J. Warren, and the paler but nevertheless beautiful variety, Mrs. W. Mease. Mr. Hugh Crawford is a very striking deeply built flower of canary yellow, and Mrs. G. Carpenter, bright rosy mauve, is another.

Illustrative of the value of the chrysanthemum as an outdoor border plant we found in full flower several plants of such free flowering early sorts as Roi des Précoces, Harvest Home, Madame Eulalie Morel, Ivy Stark, M. Dupuis, G. Wermig, Mdlle. Marie Massé, Ambroise Thomas, O. J. Quintus, and others, very valuable for such a purpose and for cutting.

ONIONS FOR AUTUMN SOWING.

I OBSERVE that "A. D." omits one point in his recent note, viz., that the best strains of summer or Spanish onions are the best and the longest keeping to sow at any season, and that they are also hardier than the Tripoli and other onions usually sown in the autumn. Possibly the hardiness is structural rather than constitutional. Thick or bull-necked onions seldom winter so soundly and well as those with small and delicate necks. The flesh of most spring onions is also harder and firmer, and more impervious and insensible to climatal influences than the larger, softer Italians, Tripolis, &c. There is yet another point in favour of sowing spring rather than the so-called autumn onions for the winter, the quality of the onion is better, and reaches to the high level of the best onions sown in February. For a good many years our onion sowing, weather and seed bed permitting, has been forwarded by a full month, the first of February being substituted for the first of March.

The sound keeping of onions is more a matter of perfect harvesting and cool storing than of dates of sowing. It may seem a long cry from July or August to February or March as favourable times to sow onions in the open. But with perfect tilth and culture, and a good selection of varieties, good useful onions may be grown at either season. Autumnal sowing, however, has this additional recommendation, it proves a perfect antidote to the greatest scourge of the onion in many gardens—the onion maggot. The practice of autumn sowing onions baulks the onion flies of their sweet and savoury nests on the crown of the bulblets for their eggs. There will be no flies about at that season to lay eggs, nor eggs to lay, nor suitable nests on the young onions to receive them, there can be no resulting maggots. And this freedom from the sore pest of maggots among our onions is the crowning victory and reward of our autumnal sowing of our main crops and best selections of onions. These will become general when growers learn that all onions are alike hardy, and should there be a difference it is in favour of those with smallest necks and hardest flesh. D. T. F.

Migration of the Landrail.—One of the most remarkable things about the landrail is, observes the *Saturday Review*, its extraordinary instinct or passion for migration. Whence comes to it that overpowering desire which, twice in the year, impels it, weak-winged though it is, to change its quarters, to range during our English springtime as far north as the bleak and frozen shores of arctic Greenland, to descend in the fall of the year away south into Africa, and eastward into Asia, reaching in its return migration countries so distant and so widely sundered as Natal and Afghanistan? At present—in spite of theories and surmises—we have no satisfactory reason offered to us for the wonderful migration—recurring steadily, persistently, and unfailingly, year after year—of a bird like the landrail, whose weak wings and strongly-developed legs plainly attest the fact that its natural powers of progression lie far more in walking and running than in flying. The extent of the migration of the landrail, although not yet perfectly ascertained, is reasonably well known. In its northern passage it reaches, during April and May, England, Scotland, Ireland, the Hebrides, the Orkney and Shetland Islands, the far Faroes, nay even such solitary and remote Atlantic rocks as the lonely islet of St. Kilda. It is well known in North Europe, resorting in its spring passage to Norway, Sweden, and Denmark. But, beyond even these great migrations, there is established the fact that this feeble-winged creature, which in September seems scarcely capable of flapping heavily for thirty paces before the gunner, can and does summon up powers of flight sufficient to carry it across stormy and trackless seas as far north as Greenland, and as far north-west as the Bermudas and the eastern shores of North America. Wonderful as are the facts and records of migration, the case of the homely landrail is certainly one of the most remarkable among the instances of this overpowering instinct. Quitting our British fields towards the beginning of October, the landrail seeks light, warmth, and a fresh variety of food southward and eastward over a sufficiently wide expanse of country. Touching here and there—as it does in its spring migration—various countries in the south of Europe, it proceeds to take up its winter quarters in North Africa, Palestine, and Asia Minor, penetrating eastward certainly as far as Afghanistan. Beyond Afghanistan its range seems limited, only one instance of the occurrence of the landrail having been recorded in India. In its African migration it is manifest that, although not yet identified in the central part of the Continent, it does pass southward right through the heart of the country. The well-known naturalist, Mr. T. Ayres, identified many specimens years ago in Natal, and its presence there is well known. Curiously enough, only a single specimen has been recorded in the Cape Colony.

WORK FOR THE WEEK.

COOL ORCHIDS.

OWING to the continued mildness of the season very little fire-heat has been required up to the present, and only on very few occasions has the outside temperature been below 45 degrees by night; therefore the ventilators have been in constant use, admitting abundance of fresh air both night and day. This, of course, has been much in favour of the occupants of the cool houses, as they have a great dislike to fire-heat or a close atmosphere, and under such favourable conditions the plants have had a splendid opportunity afforded them to make strong and healthy growths, which will greatly assist them to pass through the winter months. At the time of writing we are experiencing some very dull, wet weather, yet very mild, therefore very little damping down is required. On the first appearance of thrip, green or black fly the houses should be fumigated on two successive evenings with "X L All" vaporiser. The black fly we find more troublesome than the green, this usually attacking the flower spikes as they issue from the axils of the leaves. Keep a sharp look-out also for slugs and small snails, and set traps for them, using pieces of potato, lettuce leaves, beans, &c. They should be also carefully sought for at night with the lamp. I fancy slugs are more voracious at this season than at any other, and they play sad havoc among the tender roots and flower spikes. With regard to the flower spikes, I think there is no better plan than to place a little cotton wool round the base of the spike as soon as it makes its appearance. With valuable plants it is as well to adopt the plan of placing them on an inverted pot stood in a saucer filled with water, and even then it is necessary to watch the plants narrowly for a few weeks at first to see that no slugs have been imprisoned in the fortress, as they cannot pass the moat either way.

Lycaste Skinneri, and its variety alba, having now matured their growths, will soon begin to show their flower spikes, these being produced from the base of pseudo-bulbs; from the time the spikes appear a much less supply of water will be needed, taking care, however, not to allow the plants to become dry and cause the pseudo-bulbs to shrivel. L. cruenta, L. aromatica, Anguloa Clowesi, and A. Ruckeri should also be kept pretty dry at the root, and given the driest position in the house. A pretty little cool-house orchid is Cœlogyne ocellata; the spikes, which appear in the young growths, do not produce flowers until the bulbs are matured, this event taking place at the present season, and from now up to the time root action begins again very little water will be sufficient for its needs; the same remarks apply to C. Schilleriana, which has also finished up its pseudo-bulbs, but this species does not flower until next spring, when it produces its flowers and foliage simultaneously. C. cristata, having now completed growth, will only require sufficient water to keep the bulbs from shrivelling; a cool, dry greenhouse, with the temperature as low as 45 degrees, will suit it during winter, and in such a temperature very little water indeed is needed. The sweet-scented Trichosma suavis, having passed out of flower, is now starting into growth, and if repotting is required it should now be attended to; the ordinary orchid compost will suffice over good drainage. Very little water is needed for some time, only keeping the material just moist until root action becomes brisk.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

FOR the next few weeks chrysanthemums will prove the main feature in the conservatory and also provide cut flowers; but, serviceable as they are now, they are a great deal more so later on, that is, during the latter part of the year and the beginning of January. At that season most gardeners have an extra demand for plants and flowers, and by having a hundred or so to fall back upon it saves the forced bulbs, poinsettias, and the like; even the latest varieties of chrysanthemums are liable to be past their best at the period named, when the right buds were not selected or the plants have not been carefully retarded. To ensure a good late display it would be wise to examine the stock of plants at once, and draw out all which promise to be backward, standing them in a cool, airy vinery or peach house, where only just sufficient warmth need be turned on at night to ward off frost. Where individual plants are likely to be required for room decoration they should be arranged thinly, so as to preserve as much of the lower foliage as possible, without which they will not prove serviceable. Where space is limited and cut bloom is the desideratum, then the plants may be packed much closer together, and, though they may lose leaves, the quality of the bloom is not greatly reduced, and, of course, a larger quantity is obtained. We find it best to devote a few plants of each variety and place them by themselves for the supply of cut bloom. The whole plant can then be cut down if necessary, and the stool removed to a cold frame at once, which is far better than cutting over the whole collection daily for what cut flowers are required. Now is the season to see that the different varieties are properly named, affording new labels where necessary, so that they can be easily recognised when the time arrives for taking the cuttings. Some are naturally shy in producing these at the time it is desired to take them, therefore the old plants should not be destroyed until they are secured; on the other hand, of those which show cuttings freely only a few plants need be reserved. Cold pits are the best places for cut-down plants; they can be arranged near the glass, and the lights can be entirely removed during mild weather, double mats, of course, being at hand for covering the glass during hard frosts.

The earliest bulbs, such as Roman hyacinths and paper-white narcissus, will now be sufficiently rooted—where potting was done early in September—for placing in gentle heat, when they would produce flowers in a week or two. The foliage of each of these should be well up, even with the slight protection of a cold frame, where all the early bulbs should now be stored. There is no difficulty in getting the varieties named to flower in November providing they are well rooted, and not placed in a brisk heat at once. Time is saved by bringing them on gradually, and the substance and keeping properties of the flowers are improved thereby. When brought direct from the outside plunging bed of ashes or sand and placed in a temperature, perhaps, of 70 degrees, the change is too sudden, resulting in many of the bulbs coming blind, when of course they are useless. Batches of each variety should be uncovered, and arranged in cold frames near the glass. The young growth then becomes inured to the light, and saves the check often given by exposing the growth which has grown up through the plunging material several inches and become blanched. When they reach the stage for placing in the forcing pit, arrange the pots near the glass, as during the sunless days of winter the spikes of hyacinths in particular become weak and unsuitable for arranging in glasses. The same remarks apply to freesias. These should always occupy a shelf near the roof, and if a moderately warm house can be used when they commence to flower both increased substance and perfume will be added to the bloom, which is not the case when they have to develop in a close, humid forcing pit. The stock of forcing shrubs, such as thorns, lilacs, deutzias, azaleas, and rhododendrons, should be arranged in a sheltered spot, standing or partially burying the pots in ashes, and then pack bracken, long litter, or leaves about them to prevent frost reaching the rims. Such plants are better left in the open until required for forcing, as a few degrees of frost proves beneficial, and they generally force more readily afterwards.—RICHARD PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

THERE is much work at the present time in collecting fallen leaves. This should by no means be neglected, for they not only give the place an untidy appearance, but where accumulated in any quantity amongst small plants they hold the moisture, and so cause them to decay; therefore, as they fall, have them collected together in a heap, as they will be found useful for making hot-beds. Forcing of vegetables in some establishments will now be general, for where a great variety is needed there is always some difficulty in obtaining a suitable change. Owing to the long-continued dry weather, spinach has not made much progress until the last few weeks, and as the nights are now getting too cold for rapid growth this vegetable will be scarce during the coming winter should it be severe. Where an abundant supply of moisture could be afforded, celery will have grown sufficiently to be ready for its final earthing. Choose dry weather for this operation, for if the soil be put to the stems when in a wet condition there is always a probability of causing it to rot. It will not be necessary to earth the late planted lots for the present, as celery is perfectly hardy until such times as it is blanched. The blanching causes the stems to be tender, rendering them liable to injury if frozen. In districts where the rainfall has been plentiful broccoli will have made rapid growth this autumn, particularly where the soil is in good heart. This being so, they should be lifted and the heads turned to the north that the leaves may fall over the hearts to protect them in case of severe frost. The latter part of October was very wet in some districts, which has prevented many outdoor operations, such as the wheeling on of manure and digging, but when dry enough this work ought to be got in hand, for when digging is properly done in the autumn much time is saved in spring, when other work is more pressing. All vacant ground should now be turned up roughly as deep as the soil will permit without bringing to the surface barren subsoil. When treated in this manner and left until March it will break down finely with ease. Moisture is materially conserved when the ground is dug in the autumn, as it has time to solidify before being planted. In some places it is the rule to make a sowing of peas about the middle of November. If the situation be sheltered and the soil of a light nature often good results follow should the winter not be too severe, and for those who have no accommodation for forwarding plants under glass the practice is to be commended, as a week or so in the time of gathering is of great importance. Those who desire a good dwarf kind will find Chelsea Gem, William Hurst, Sutton's Forcing, and Carter's Forcing all good. They may not be quite so hardy as some of the round-seeded kinds, but with me there has not been much difference. The one great drawback to these autumn sowings is that they are subject to the attacks of snails and other enemies for so long a period before the weather is sufficiently warm to induce them to grow out of their way. In heavy soils these are far worse than in light ones, there being far more harbour for them under the small clods. It is not necessary to sow so deeply at this time of the year as during hot, dry weather, there being sufficient moisture to cause quick germination.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

To obtain successful results from the very early forcing of peaches and nectarines it is quite necessary to go slowly to work with them at first, as the trees will not bear any undue hastening to commence with, and the slower their development, provided they are kept moving up to the time the fruits are set, the more likelihood there will be of a satisfactory crop. If this is borne in mind and acted upon, peach forcing becomes an easy matter, and the cause of nearly all the failures which happen is the application of too much heat, as this makes the blossoms flimsy and unable to develop and set properly. An early start made within the next fortnight will give ample time to produce fruits as early as they can be grown, without having to hurry until the dangerous stages have passed. First of all, the trees should be pruned, cutting away all weakly spray, and if the shoots left are not well ripened it may be necessary to shorten them slightly; but I always advocate and practise leaving the young shoots as long as possible, and only shorten in cases of unripe tips or where there is not room to lay them at full length. In shortening, cut to a wood bud, which can be readily recognised by its pointed form. Some peaches, especially early varieties, make very few wood buds on the young growth, and it is very necessary to be careful in shortening these, and it is not always safe to rely on the middle bud of triplets being a wood bud, so that the grower should make himself thoroughly acquainted with such buds by close observation. When the trees are pruned they should have a thorough cleansing, and if red spider or scale have been troublesome a vigorous syringing with clear water, heated up to 120 degrees, may do all that is necessary, and the woodwork and glass should be thoroughly cleansed. I am no advocate for the indiscriminate use of insecticides on trees at this time of the year, especially nowadays, when we have such excellent and deadly appliances as vaporising insecticides in the growing season, when found necessary. Tying in the trees should immediately follow cleaning, and do not fear to remove a few more shoots if those left on appear to be closer together than they ought to be, for nothing is gained by having a plethora of wood and leaves in the trees, for a very thinly-trained tree will carry more fruits than can ever be brought to perfection, and beyond a few extra to allow for a little dropping—some of which is sure to take place if the weather is unfavourable during blossoming time—such fruits are only an extra and needless tax on the trees.

In commencing to force no heat should be applied for the first fortnight, but the ventilators should be kept closed, and this will give the necessary impetus, especially if aided by a very gentle hotbed of leaves being made up inside the house directly before the house is closed, as this can be relied on to very gradually raise the temperature. I prefer leaves alone for this work, as the fermenting action is steadier with these than it is with stable litter. A night temperature of [illegible] degrees should be the maximum for the first fortnight, except when it is too mild outside to bring the house down so low, and 5 degrees higher will be sufficient rise after that up to the time when the flowers open. A little ventilation must be given on sunny days to keep the temperature down, as this ought not to rise much above 50 degrees at any time. Occasional light syringings may be given, but their regularity should depend on the weather, and in any case they ought not to take place after midday. When the weather is not suitable for overhead syringing the hotbed should be sprinkled twice daily, and this will keep up a sufficiently humid atmosphere. Only use fire-heat when absolutely compelled by frosty weather to do so. Presuming that the border is in a moist condition when the house is closed it will not require any water for a few weeks. I prefer to give a good soaking a few days in advance of closing the house rather than to give it then, as too many exciting causes at one time are not good; still, if this has not been done, it must not be neglected, for anything is better than a dry border. Keep a sharp look-out for green or black fly directly the trees are seen to be on the move, for these pests are soon at work, and a stitch in time with these saves more than the proverbial nine. For their destruction I find nothing so good as one or other of the vaporising insecticides now on the market.

The November fogs make constant attention to grapes hanging on the vines necessary; bad berries should be sought for at frequent intervals and cut out. A dry atmosphere, with some top ventilation, must be kept up, and this can only be done by the aid of a little fire-heat by day. Front ventilation I find absolutely dangerous here, for the situation is low and exceedingly liable to fogs, in consequence of our proximity to large sheets of water. Bananas showing fruits must be kept in a high temperature and growing briskly all the while if we are to prevent the bunches from becoming deformed. All overhead syringing should be suspended from such plants.—J. C. TALLACK, *Livermere Park Gardens*

NOTES FROM IRELAND.

WE are having the finest autumn ever known in this country. The harvest was brought in in splendid condition, the hay and corn crop being excellent, both in quantity and quality. Grass, too, for the time of year, is exceptionally abundant. As is usual in years of plenty prices for all agricultural produce are very low; the very best oats can be readily obtained at the rate of a halfpenny per pound, while hay and straw are correspondingly cheap. Mangolds, swedes, and turnips are splendid crops everywhere in this locality, but, of course, these are not yet on the market. Barley is this year, so far, the most remunerative crop, and sells readily at from a penny to a penny farthing per pound rate, according to quality. Potatos are turning out a splendid crop of the very best table quality. I have not this season had facilities for testing many varieties of potatos in fields, but hope to go in for them more extensively next year. Main Crop gave a very creditable crop of good serviceable sized tubers, and the quality when cooked is excellent. Garton produced an astonishing crop, the tubers being enormously large; they are, moreover, of excellent quality. Champions are very thick this year, though smaller than usual, but what is of greater importance their cooking qualities are all that could be desired; this variety is somewhat affected by the disease, but all others are singularly free from disease this year. Our soil is a strong rich loam, resting on gravel. Beauty of Bute produced a very good crop of even-sized tubers, of the best cooking quality. Some people consider this variety too sweet in flavour to be a good eating potato. The Bruce, an old favourite of mine in the south of Ireland, has done famously here this year in every way. When in county Kerry recently I noticed some magnificent samples of Champions, the produce of plants that had been twice sprayed during the season. After this demonstration of the good result of spraying, I am, from being somewhat prejudiced against the system, now on the high road to becoming an advocate of it.

A most beautiful sight around the picturesque and thriving town of Cahirciveen is the luxuriant masses of Fuchsia Riccartoni. Around some of the cottage gardens I noticed the hedges were made completely of this charming shrub, and right well they thrive in spite of the terrible wind which must sweep on them there sometimes from the broad Atlantic. I saw some of the most magnificent scenery there it has been my good fortune to see, and, though a long and tedious journey, one is amply repaid with the splendid scenery in which the locality abounds. A recent inspection of the chrysanthemums being grown by the holder of the challenge cup of the R.H.S. of Ireland was to me an introduction to "the rust" which is now agitating the minds of chrysanthemum growers generally, and Mr. Mitchisen in particular; his plants are badly hit, and, of course, it has the appearance of destroying the plants, but I should say that the quality and substance of the blooms are in no way affected by the rust. The blooms are very promising, but it will give enough to do to have them in bloom by Nov. 9. Dahlias, Michaelmas daisies, Schizostylis, and Pyrethrum uliginosum are making a splendid display just now. All leafage is as green now (October 29) as it was in August. Evidently, we shall get no autumn tints this year, as the leaves will probably fall before they change colour.

R. WELLER.

Co. Kildare.

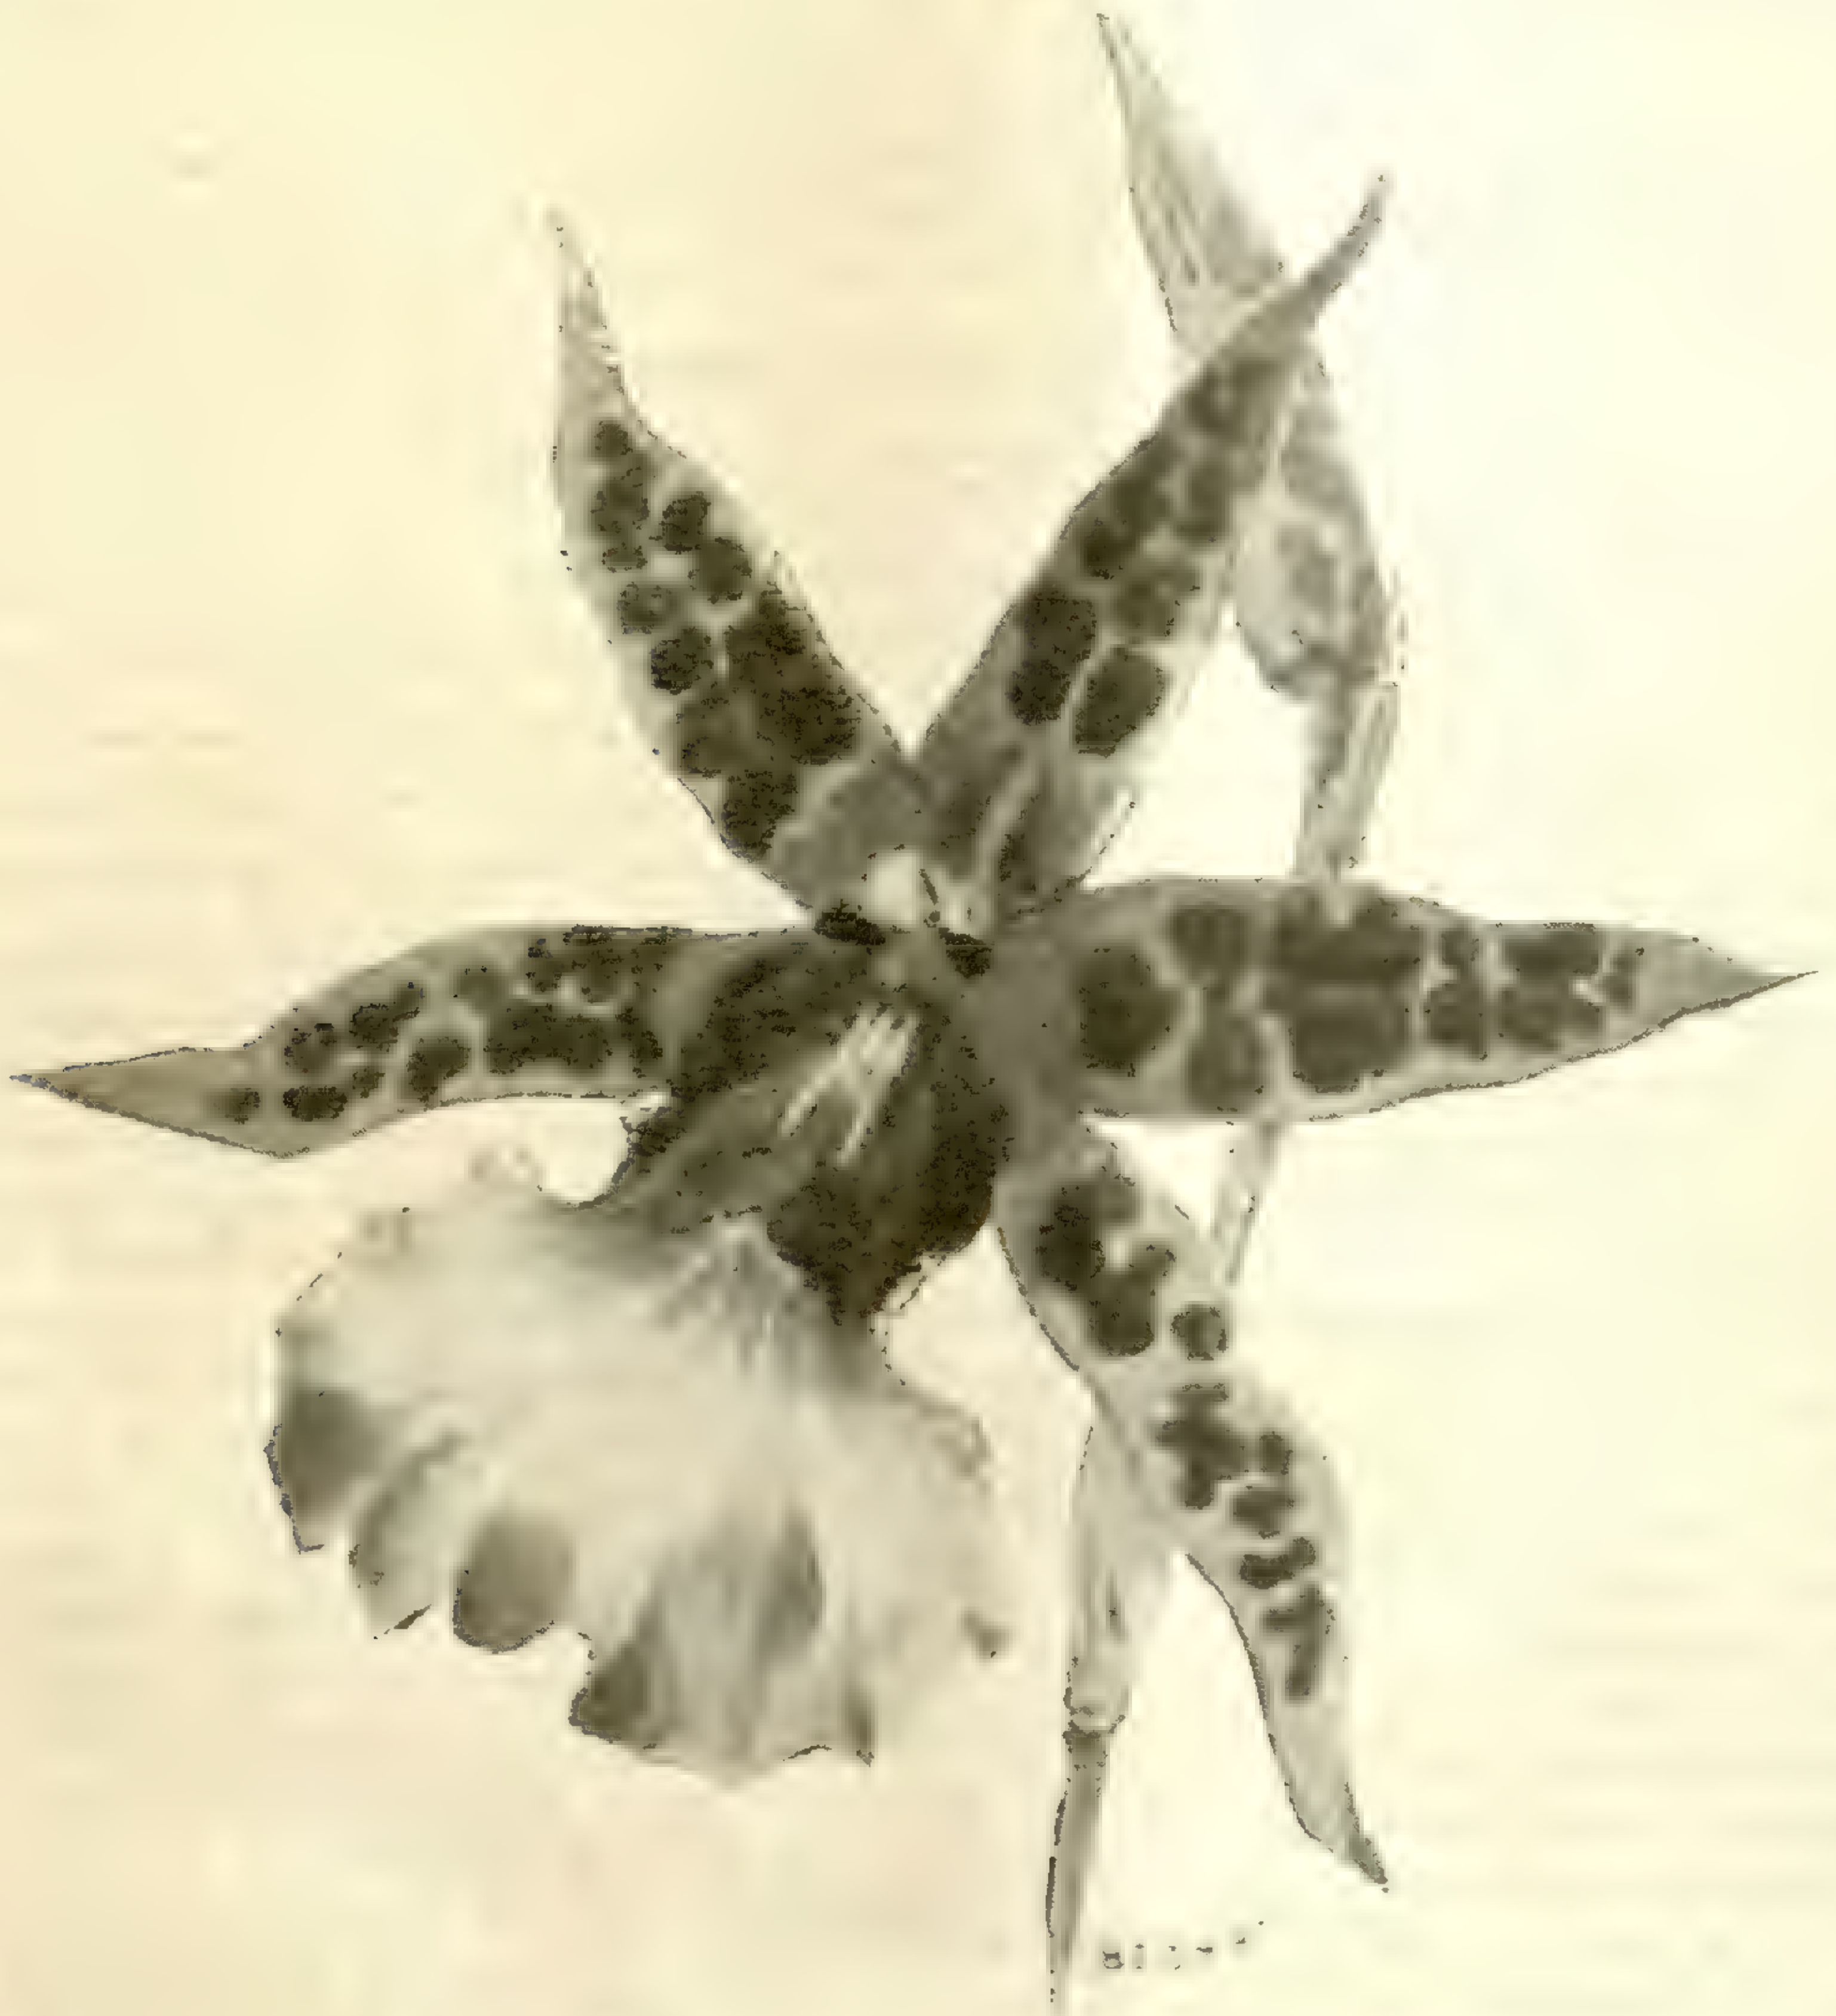
CHRYSANTHEMUMS AT BICKLEY HALL.

SOME two thousand plants of different types are grown here under the skilful hand of Mr. Dove. Japanese varieties largely predominate, although there is a goodly number of incurved sorts represented in excellent condition. A system of culture finding much favour at this establishment is that of propagating early in the spring, and flowering the resulting plants on single stems, each plant in a six-inch pot. By these means blooms of phenomenal size are now seen in large numbers, and for grouping purposes these plants lend themselves so well for such arrangements. As this happens to be one of the chief objects in the cultivation of the chrysanthemums at Bickley Hall, it is expected a good account will be given at many of the shows in and around the neighbourhood. Handsome blooms of Madame Gustave Henri, on second crown buds, quite pure white; Australie, very tall; Western King, opening very kindly; M. Edouard André, the finest blooms we have seen of this peculiar flower; Louise, very large and compact; G. C. Schwabe, exceptionally fine and of good colour; N.C.S. Jubilee, probably doing as well this season as ever; Hairy Wonder, time of flowering well calculated; Thos. Wilkins, represented by dense and well-coloured flowers; Surprise, valued because of its colour in the group; Simplicity, particularly chaste and white; besides many other well-known varieties in excellent condition. High quality was seen in the incurved varieties. Large, handsome, neatly-incurved flowers of Duchess of Fife were fast developing—one particularly fine bloom on a plant in a forty-eight sized pot called for special praise; D. B. Crane was simply charming, deep blossoms of golden buff, very regular and globular, stamping this as a useful bloom for the early shows; Chas. E. Curtis and some of the Princess family looking well. To Mr. H. E. Fry, the generous proprietor, much is due for the encouragement given to the cultivation of the chrysanthemum here.

VISITOR.

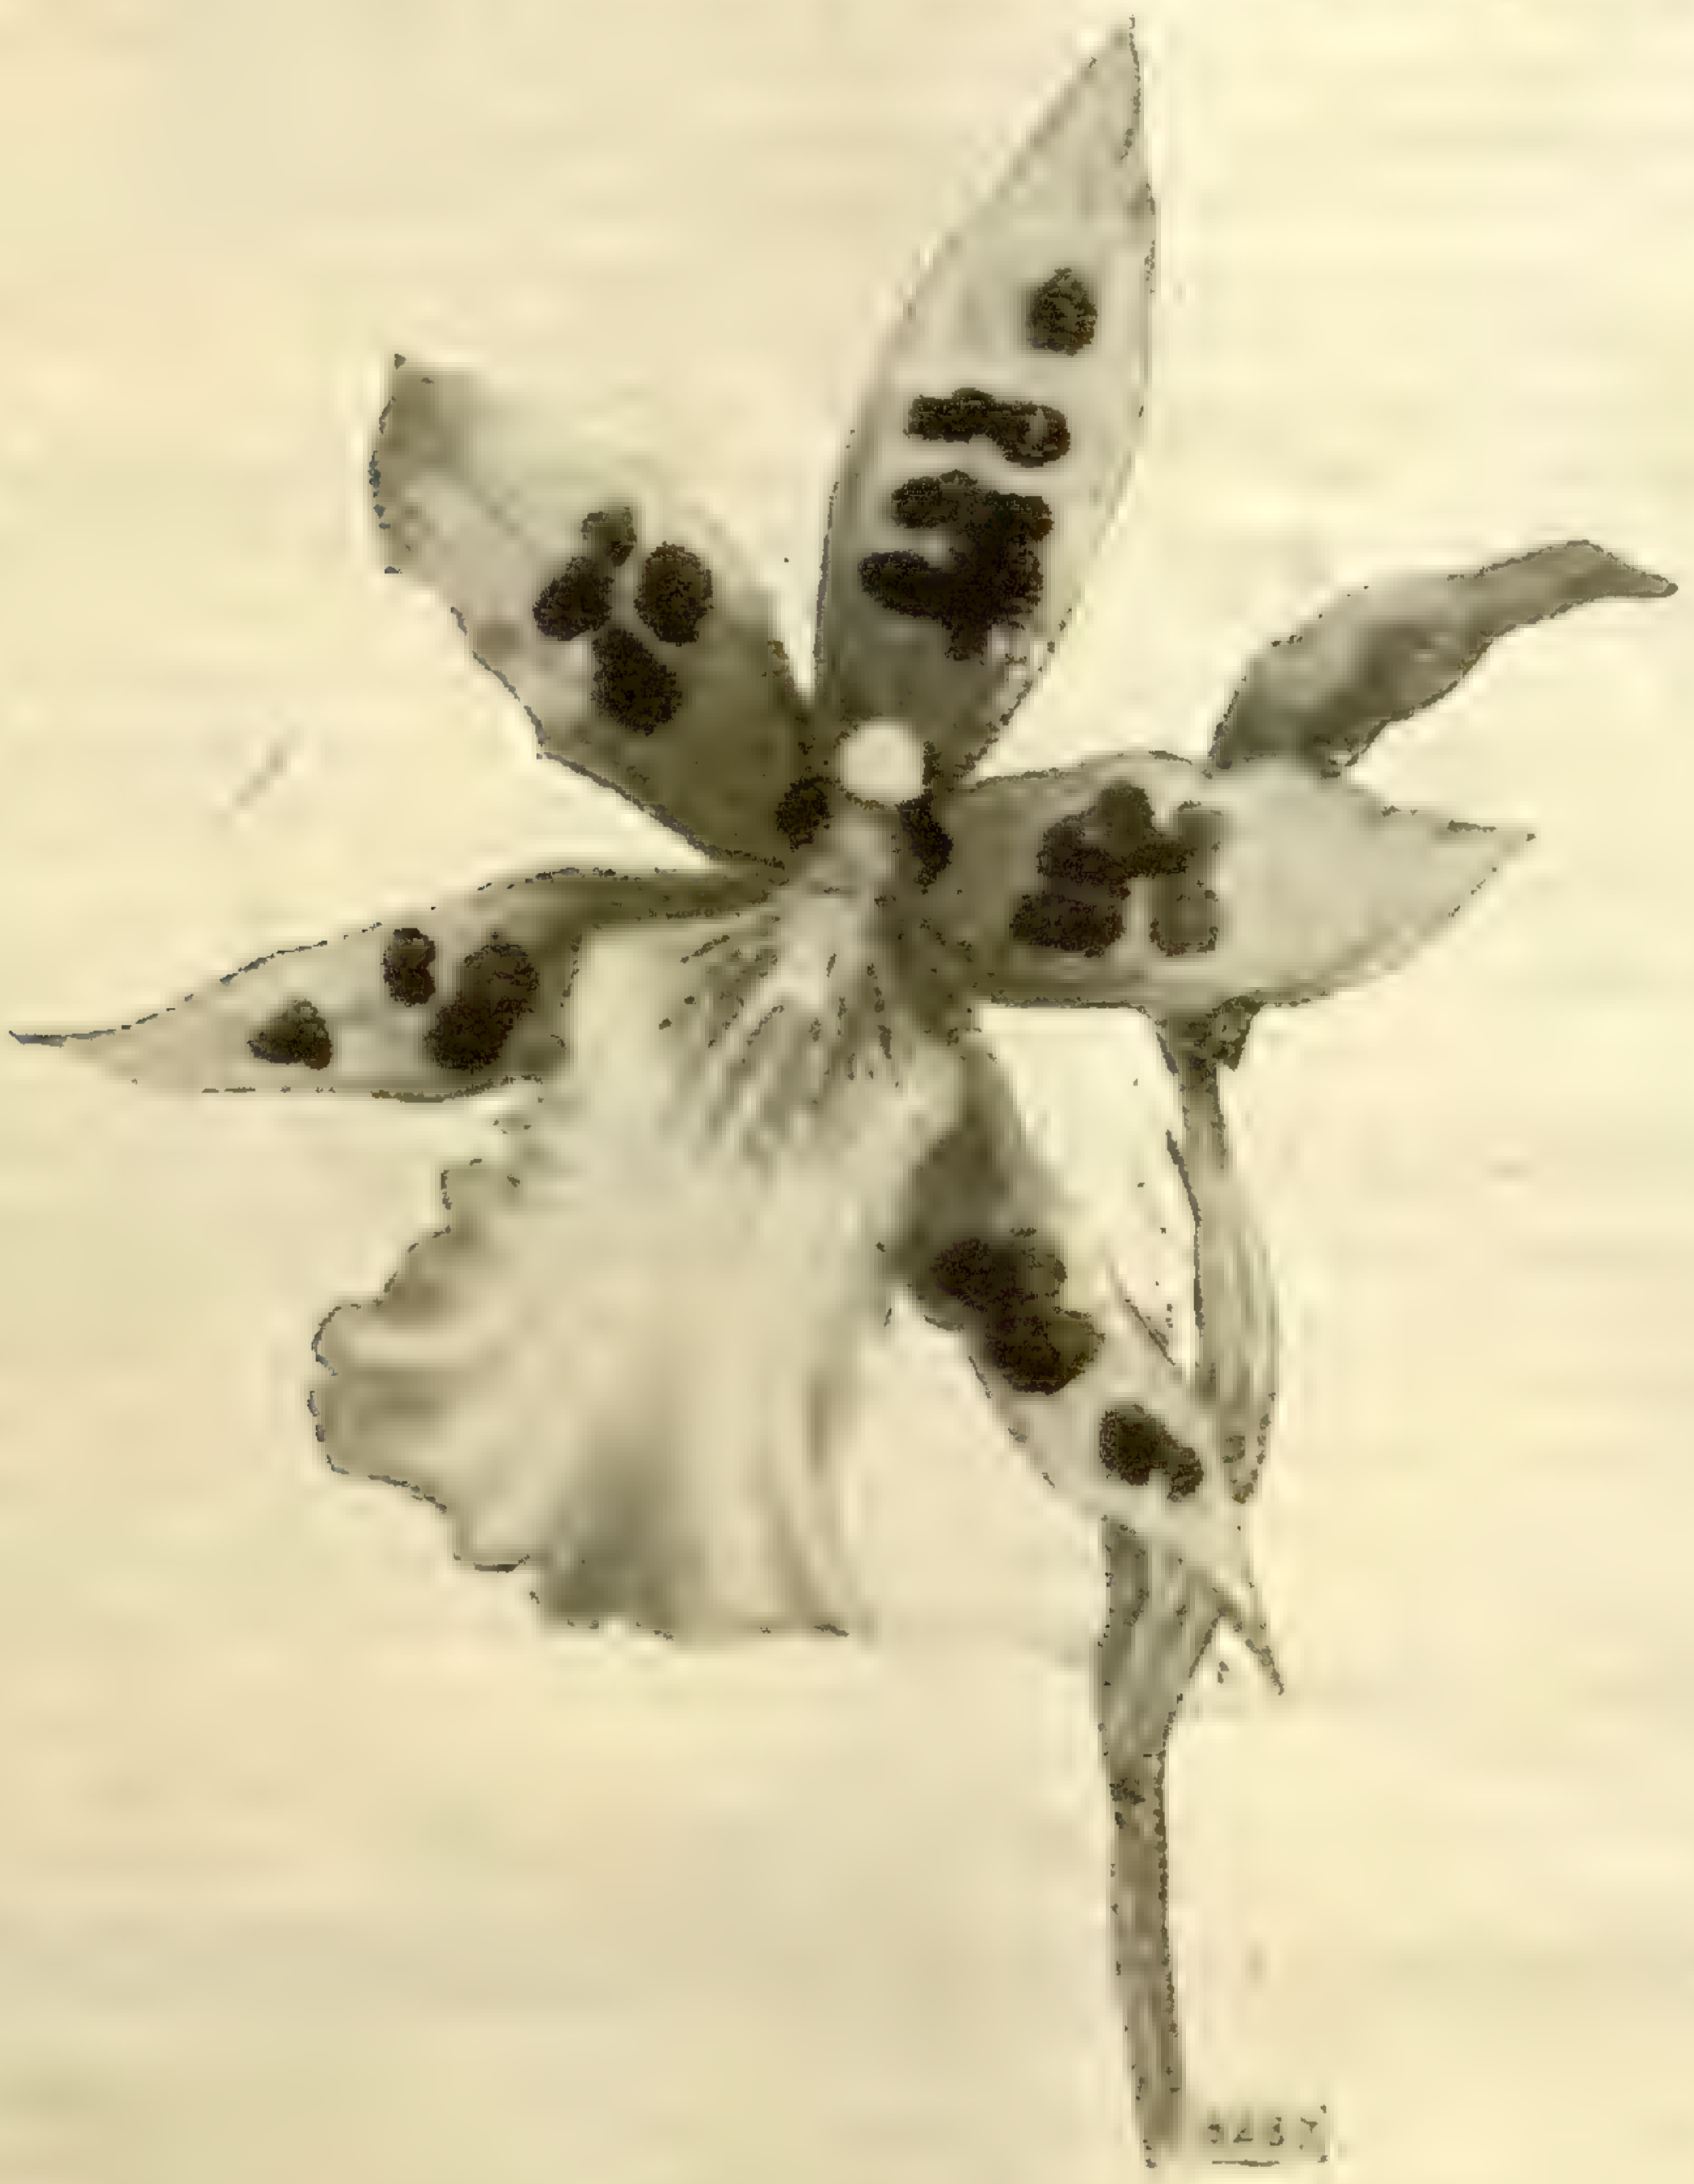
SOME HYBRID MILTONIAS.

THERE is perhaps no genus of the orchid family that has yielded more natural hybrids than the Miltonias, and these form an interesting and beautiful addition to our collections. Some of the natural hybrids have been in cultivation for a number of years, but the majority are practically of recent introduction. A short note, with the accompanying illustrations of some of these, will, no doubt, be of considerable interest to orchidists.



MILTONIA BLUNTI VAR. LUBBERSIANA.

There has been only one hybrid raised artificially, and it is worthy of note that it has been obtained first by M. Bleu, of Paris, and since then by Mr. Sedin, in Messrs. J. Veitch and Sons' nurseries. The cultural details relating to Miltonias are so ably dealt with in the weekly calendars of the GARDENERS' MAGAZINE that further reference is not called for here, as they are as suitable for the new as the older known sorts.



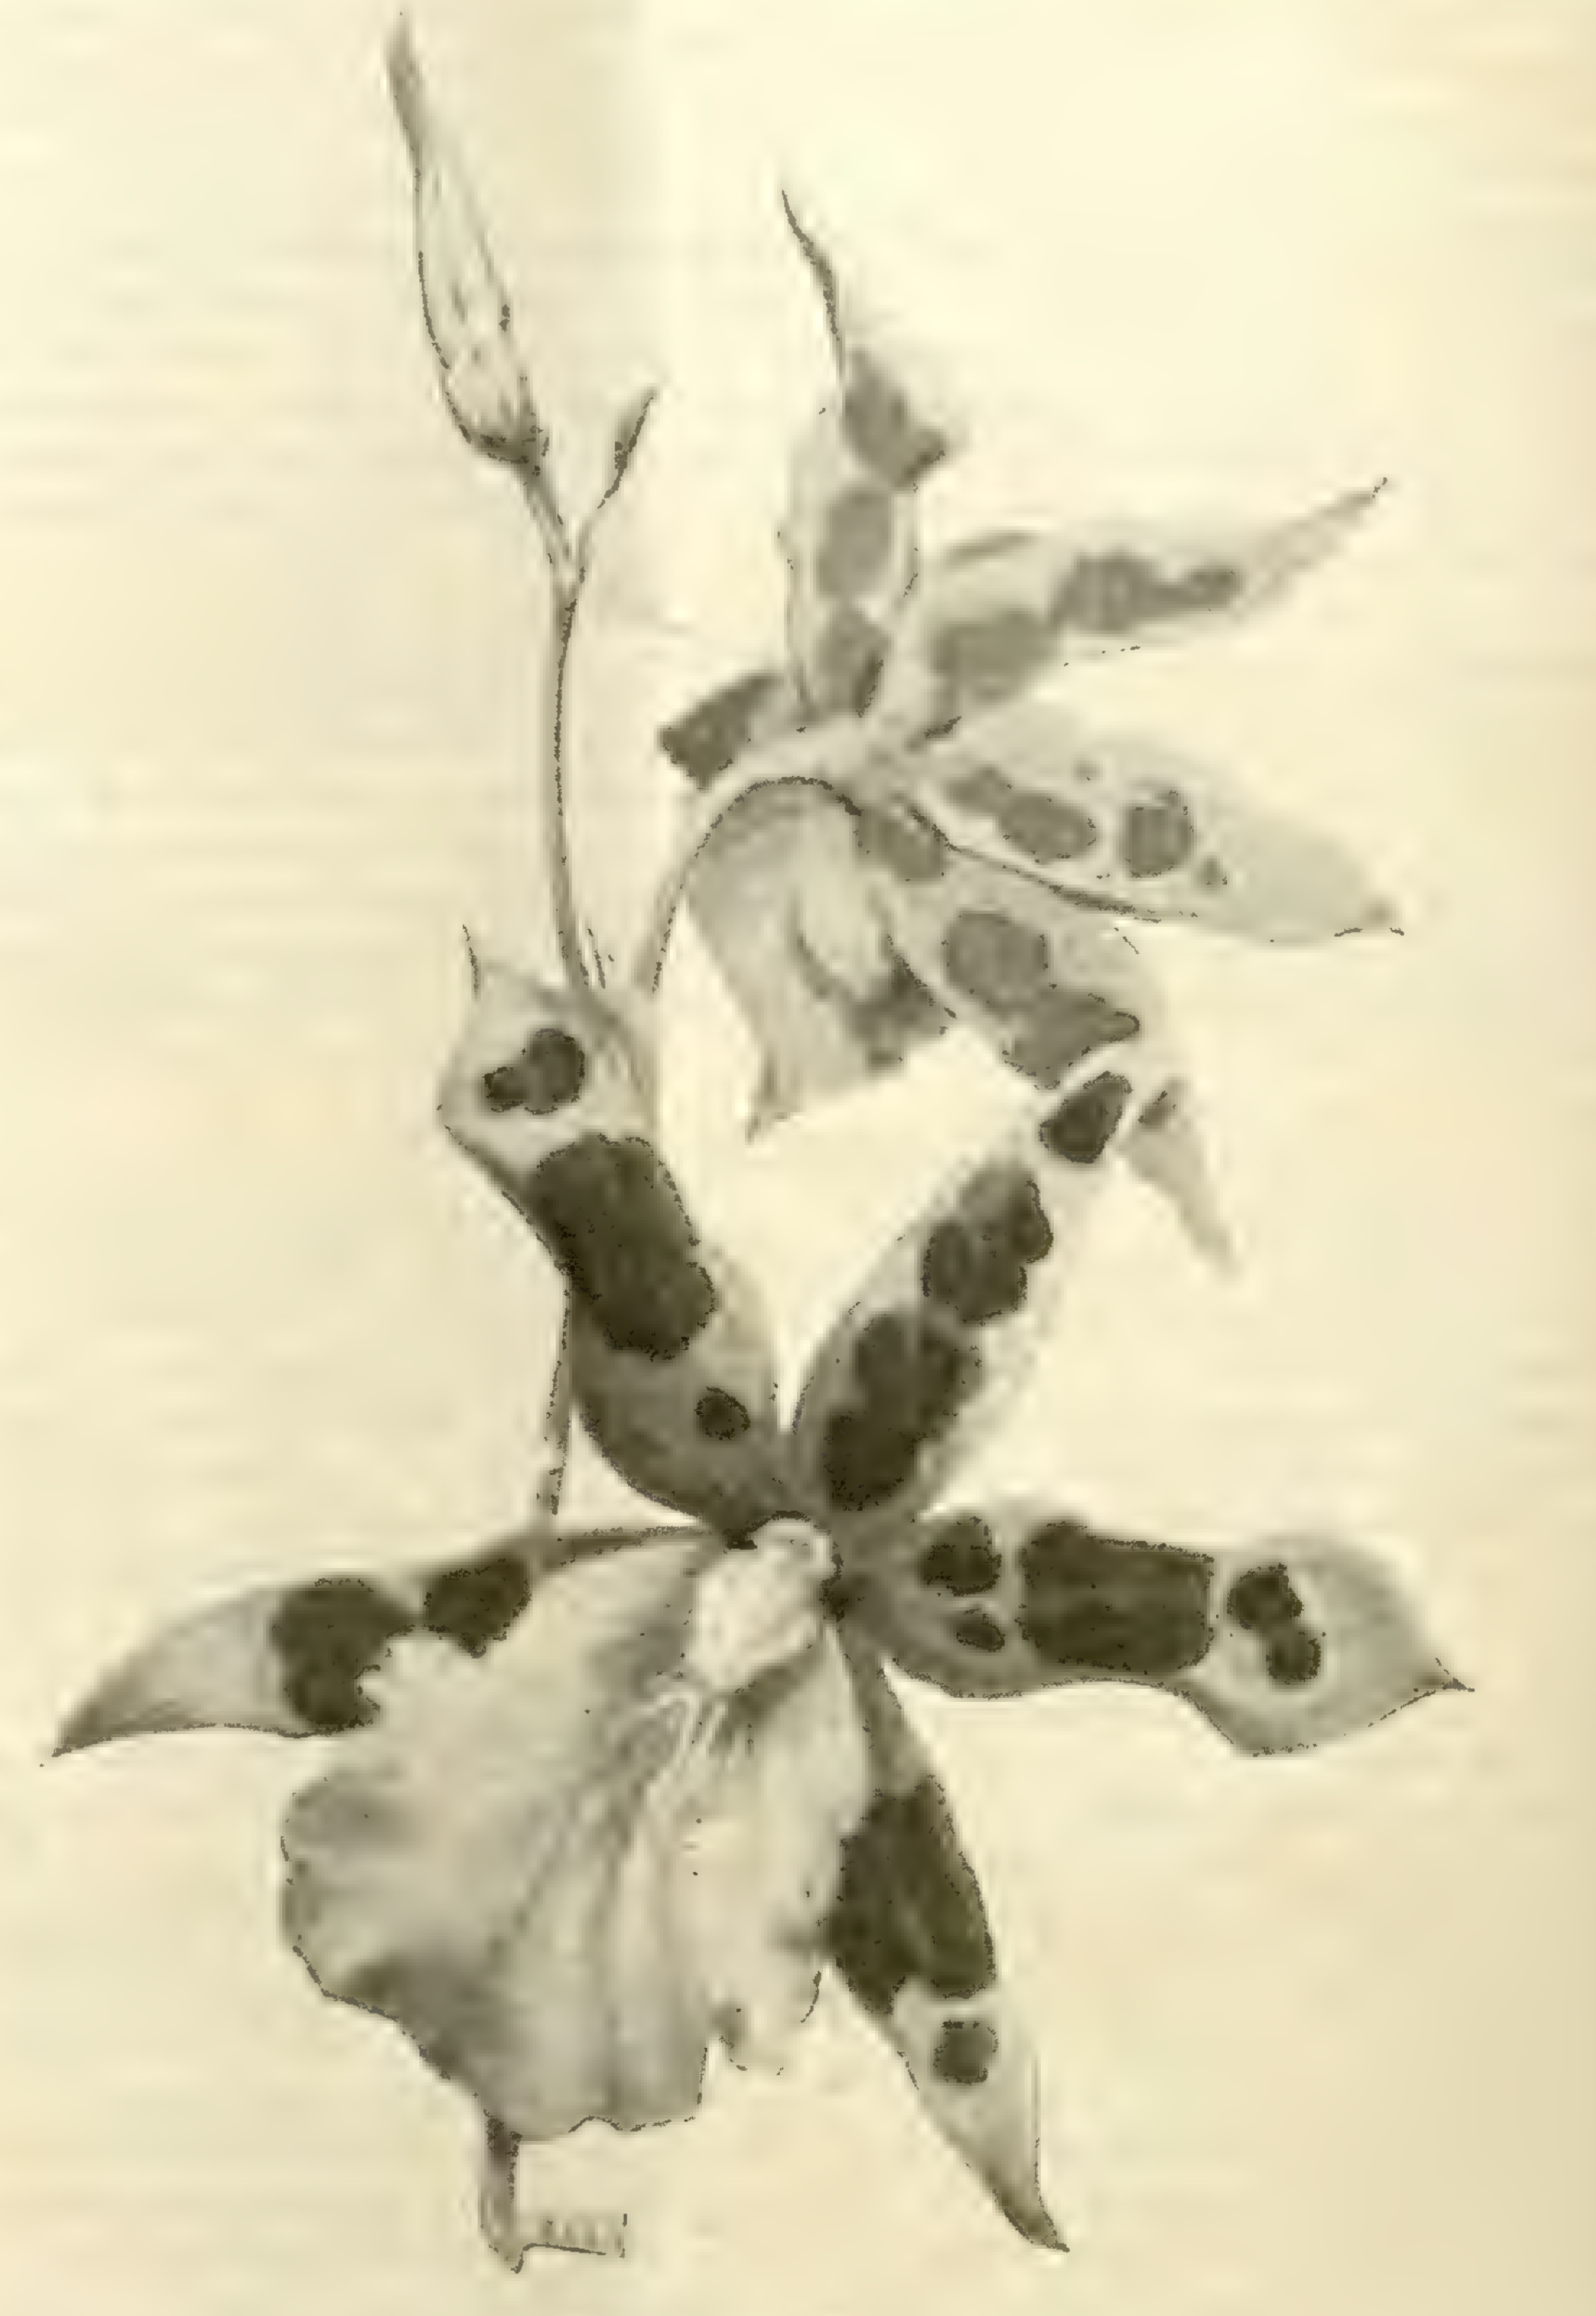
MILTONIA LEUCOGLOSSA.

M. FESTIVA.—This is no doubt a natural hybrid between M. spectabilis and M. flavescens. It was the first to make its appearance, and was described in 1868. The flowers are produced three or four on a spike; the sepals and petals creamy yellow. The large lip has a ground colour of creamy yellow, mottled and suffused with purple. It is a very rare orchid, and is only met with in a few collections where Miltonias are appreciated.

M. BLUNTI was first described in 1879. It is supposed to be a natural hybrid between M. spectabilis and M. Clowesi. It has the intermediate characteristics of both these species in the habit of growth, and also in the shape and colouring of the flowers. The sepals and petals are creamy yellow, the central area being almost wholly covered with large reddish-brown blotches. The apical part of the lip is white, the basal part becoming suffused with crimson purple.

M. BLUNTI LUBBERSIANA is one of the most handsome Miltonias in cultivation. The flowers are larger than the original form, and the colour also is finer. The sepals and petals are light yellow, with some violet purple at the base; the central area is covered with numerous dark brown blotches and spots. The front lobe of the lip is white, becoming suffused with purple at the base, where it has a prominent, ridged, yellow crest. The accompanying illustration was made from a plant recently exhibited by Mr. White at the Drill Hall, from the collection of Sir T. Lawrence, Bart.

M. BINOTI is supposed to be a natural hybrid between M. candida and M. Regnelli. The sepals and petals are buff, with a suffusion of purple at the base, while the central area is covered with large light brown blotches and spots. The lip has the intermediate characters of the two species from which the hybrid is supposed to have been derived; it is pale lilac suffused with purple and veined with another and darker shade of purple. It has several raised, light-coloured ridges at the base, the centre one being bright yellow. This hybrid is of free habit, and a most desirable orchid. The plant was exhibited before the orchid committee of the R.H.S. on September 20 last, when it was adjudged worthy of an award of merit; it came from Sir T. Lawrence's collection.



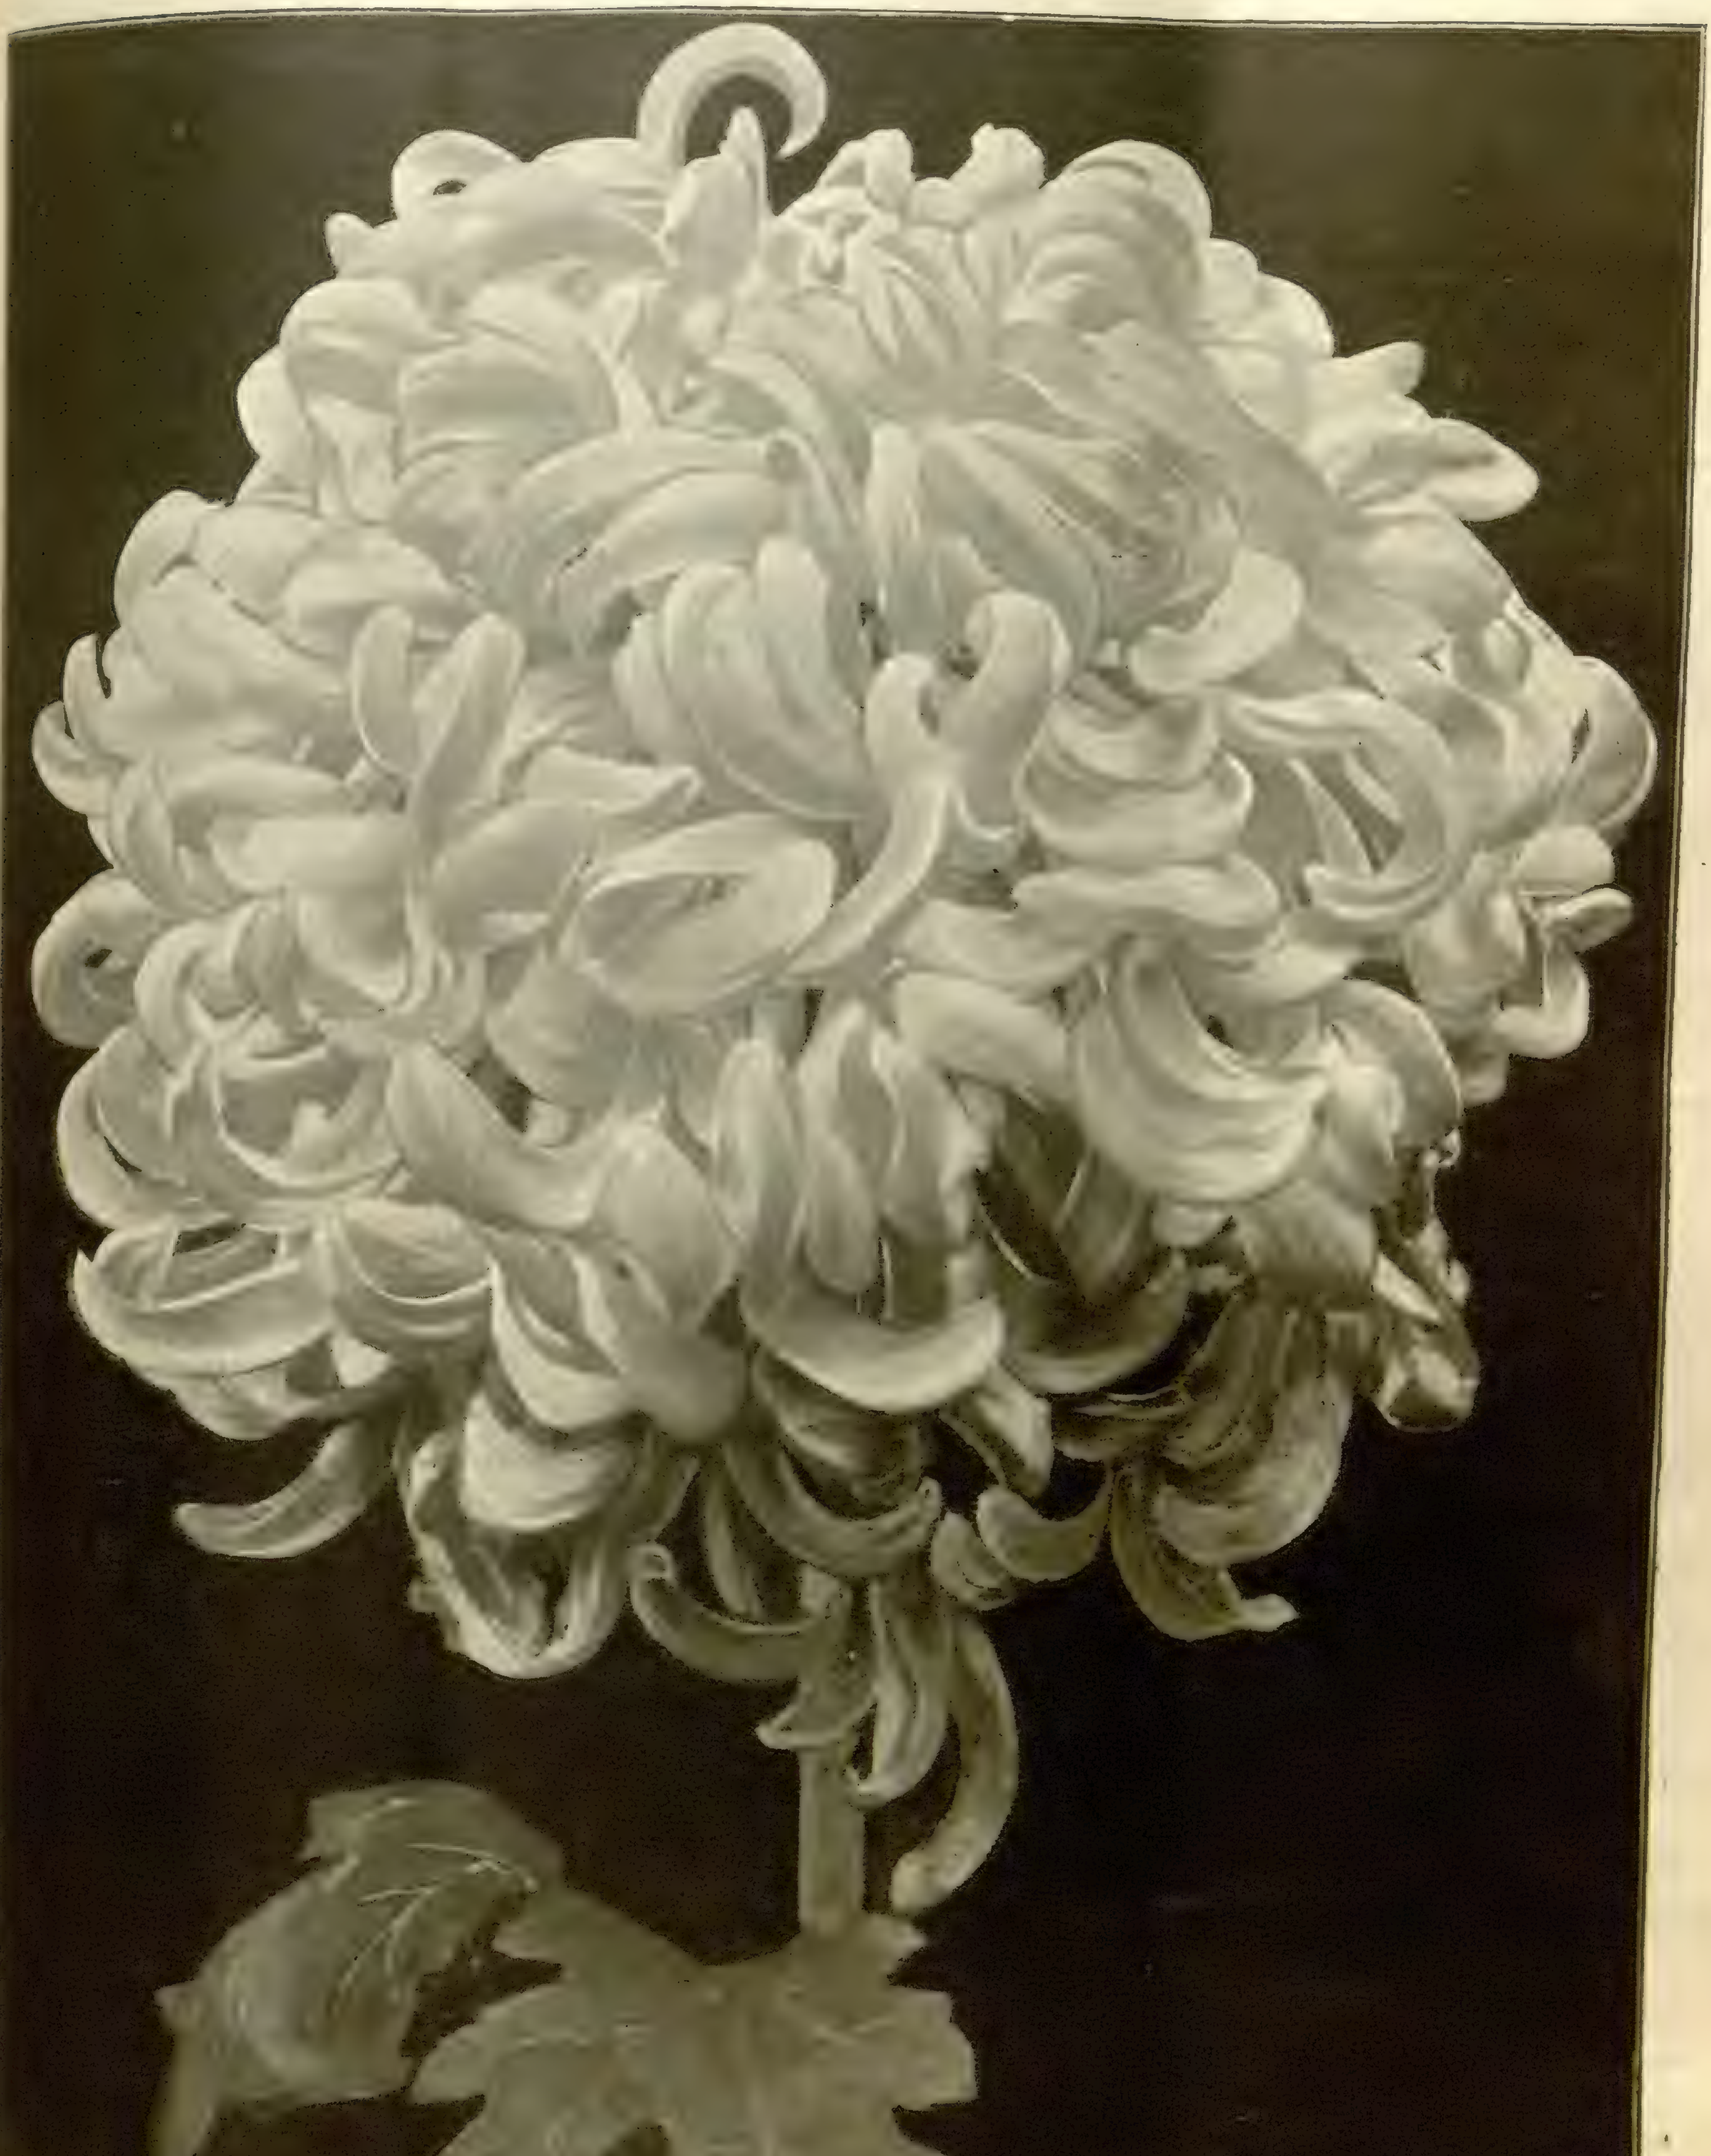
MILTONIA BINOTI.

M. LEUCOGLOSSA is one of the most distinct and desirable Miltonias one can grow. The sepals and petals are greenish-white, spotted with a distinct shade of violet-purple. The large lip is pure white, except at the base, where it has a violet-purple suffusion on either side of the yellow-ridged disk. It resembles M. spectabilis in the habit of growth, and is probably a hybrid between that species and M. candida. It was exhibited before the Orchid Committee on September 20 last by Sir T. Lawrence, and gained an award of merit on that occasion.

M. LAMARCKIANA is considered to be a hybrid between M. candida and M. Clowesi. Its sepals and petals are deep brown, barred and tipped with yellow. There is also a suffusion of purple at the base. The front half of the lip is pure white, with a blotch of purple in the centre. There are several raised ridges at the base, white shading to purple at their bases. It has the intermediate characters of the two species.

M. PEETERSIANA is a natural hybrid between M. spectabilis Moreliana and M. Regnelli. It is most distinct, of free habit, and possessing a good constitution. It is intermediate between the two species, from which it is supposed to have been derived. The sepals and petals are light purple. The lip also is purple, with a darker shade of colour in front of the raised yellow lines forming the disk. It is worthy of a place in any collection where Miltonias are appreciated.

The only garden hybrid that has yet been introduced is M. Bleuana, and as stated above, has been twice raised by the inter-crossing of



CHRYSANTHEMUM MISS NELLIE BYRON. (See page 73[illegible].)

M. vexillaria and M. Roezlii. The Continental raised form has been the more interesting of the two hybrids, from the fact that M. Bleu raised a larger number of seedlings than was obtained by the Messrs. Veitch. As with most other batches of seedlings, there has been considerable variations in M. Bleuana, so much so that the Orchid Committee have distinguished no less than five varieties to which they have awarded first-class certificates. Its many forms are very handsome and desirable, and when grown under suitable conditions it is one of the easiest plants we have to deal with. It requires the warm intermediate house treatment throughout the year, with a liberal supply of atmospheric moisture at all seasons. The plant has lent itself readily to multiplications in continental collections, and can now be procured at a reasonable price from any of our leading nurserymen. The general habit of growth and the shape and colour of the flowers are intermediate between those of the parents, both being easily distinguished in all portions of the plants.

Cambridge Lodge Gardens. H. J. CHAPMAN.

CHRYSANTHEMUM MISS NELLIE BYRON.

MR. H. WEEKS, the capable gardener to Lady Byron, Thrumpton Hall, Derby, is now well known as a most enthusiastic and successful grower of chrysanthemums, while in addition he has gained no small share of fame as a raiser of first-rate exhibition varieties. Two varieties that have helped most to make him famous are Lady Byron and Mrs. H. Weeks, while the particularly bold and handsome varieties exhibited on the 31st ult. at the Royal Aquarium will help to maintain his position both as grower and raiser. There were four new Japanese from Thrumpton Hall gardens, named respectively Emily Towers, Lady Crawshaw, Mrs. Coombe, and Henry Weeks, all of which gained first-class certificates, and are described on p. 724 in our issue of November 5. In the present number we give an almost life-size representation of a new and distinct seedling raised by Mr. Weeks, but not yet exhibited, and which chrysanthemum enthusiasts will probably have to wait another year before they see. Mr. Weeks kindly sent us the one available bloom, and it was photographed after a railway journey from Derby, so there is no doubt about its ability to travel well. The bloom was of large size, fully eight inches across, and about the same depth. The florets are broad and slightly keeled, substantial, incurving at the top, and curling somewhat at the base of the flower. The colour is intensely pearly-white, and there can be no doubt that Miss Nellie Byron will be as great a success in a year or two as Mrs. H. Weeks is now.

CHRYSANTHEMUMS ROUND LIVERPOOL.

UNDOUBTEDLY growers this season of the autumn queen of flowers have had in this district more than their usual course of disappointments to deal with, and so far as can be gathered the reasons for failure are more unaccountable than usual. In this district the growing season appeared to be a satisfactory one, the plants generally being strong with well-ripened wood, points that are generally considered the forerunners of good blooms, but in many cases this has not proved the case, one large grower stating that he housed the finest plants, but has only obtained the worst flowers he ever had. Various causes are assigned for the unsatisfactory results, some blaming the slight frosts of September, others stating that the hot weather about the time of "taking the buds" dried the growth too quickly, thus causing contraction in the stems. Although it is generally admitted the season is an unfavourable one, yet many new varieties, especially in the Japanese, are grand, so it may be that the exhibition table will not suffer. Another point against numbers is the lateness of the flowers, whilst the principal show—Liverpool—is earlier than usual. The incurved section promise well. The Corporation of Liverpool continue to grow in large numbers, and the exhibition is thoroughly appreciated by the citizens, as evidenced by the throngs of visitors who are in attendance daily.

Botanic Gardens.

The principal house, one hundred and twenty feet by twenty, recently constructed by Mr. J. Webster from plans of the city surveyor, contains upwards of two thousand plants, the centre section containing plants bearing two to five flowers, and the outside stages are filled with bush plants of pompons, singles, &c. The plants show evidence of good treatment, having large, dark, leathery foliage, without a sign of the many pests that the "mums" are liable to. The large flowering plants vary from two to six feet in height, and, as they are placed a little lower than the paths, visitors have the pleasure of having the blooms under the eye, which is a distinct advantage. Mr. Devanney, the grower, has a large number of seedlings of considerable promise, the one named after the esteemed chairman of the Parks and Gardens Committee being a pale lilac colour of reflexed Japanese, an altogether desirable variety. The most noticeable in the general collection are M. Aug. de Lacviver, C. J. Jefcott, S. D. M. Bullier, Etoile de Feu, Mrs. D. Dewar, M. Molyneux, Dorothy Gibson (reflexed), Coun. F. Foucher (pompon). A nice bank of cyclamens and some few cattleyas and cypripediums add to the attractions of these gardens.

Sefton Park.

A fine show is presented here with seven hundred plants for large blooms and fifteen hundred bush plants, many of which were struck late, and grown on without stopping. The house is similar to that in the Botanic Gardens, and the arrangements are on similar lines with the exception that here the centre is of switchback form, which breaks the monotony of arrangement. The plants will not be at their best for a few days, and the bush plants will be even longer. An advantage is gained by striking late in reducing the height of the plants, making them more suitable for the side stages. Amongst the most noteworthy are E. G. Hill, C. B. Haywood, Mr. G. W. Palmer, Lady Byrom, Beauty of Teignmouth, Eva Knowles, Edith Tabor, and many of the older varieties of incurved. The best amongst the bush plants are W. Stevens, Fiberta, Rosinante, Rose Owen, Mrs. Dewar, Scarlet Gem (single), and Mrs. F. Travis (single).

Mr. Herbert, superintendent of the parks and gardens, and Mr. Gutteridge, superintendent of the Botanic Gardens, are to be congratulated upon the able manner in which they are carrying out the wishes of the committee in providing attractive exhibits of floriculture for the citizens of Liverpool.

EXHIBITIONS AND MEETINGS.

NATIONAL CHRYSANTHEMUM SOCIETY,
November 8, 9, and 10.

THE great event in the chrysanthemum growers' year has taken place, and as compared with other years it was as great a success as ever. The quality of the Japanese blooms may sometimes have been exceeded but by very little, and considering the difficulties of the season they were magnificent. The competition throughout was extensive and close, the judges having in most cases to point the blooms to arrive at a just decision. The exhibition as a whole was a huge and gorgeous display, and perhaps the only falling off was found in the specimen plant classes, our old friend Mr. Donald being absent from the battle. The arrangements were better than usual, as visitors were kept away as much as possible until the judging was complete. Vegetables and fruit were good, and the non-competitive exhibits formed no inconsiderable part of the general attractiveness of a great display that was worthy of the National Society.

NATIONAL CHALLENGE TROPHY.

The national competition among the horticultural and chrysanthemum societies affiliated with the National Chrysanthemum Society was fairly keen, four societies competing for the Challenge Trophy and the handsome money prizes offered. The judges had not an easy task to decide which was the superior stand, and eventually pointing had to be done to arrive at the just merits of each set. The first prize was won by the Portsmouth and District Horticultural Society, and the blooms were wholly contributed by Mr. J. Agate, nurseryman, Havant. The Japanese varieties were well coloured, of fair size and good finish, and the names were: Jane Molyneux, Mrs. Mease, Milana, C. Davis, V. Morel, Oceana, Madame Carnot, and Australie in the back row; Edith Tabor, Lady Hanham, T. Brooks, Mrs. White Popham, Ella Curtis, Madame P. Rivoire, J. Chamberlain, and a yellow seedling in the middle row; with Colonel W. B. Smith, Australian Gold, Mrs. Molyneux, Princess Charles of Denmark, Mdlle. Thérèse Rey, Dorothy Seward, Lady Byron, and International in the front row. The incurved blooms were splendid, large, well coloured and finished, the varieties being Mrs. N. Molyneux, Lady Isabel, Perle Dauphinoise, Miss Violet Foster, Globe d'Or, Duchess of Fife, C. H. Curtis, and Nellie S. Thelfall in the back row; Baron Hirsch, Miss M. A. Haggas, Ma Perfection, Princess of Wales, Madame Ferlat, Mrs. G. Coleman, J. Agate, and Dorothy Foster in the middle row; and J. Kearns, Lord Rosebery, John Miles, Topaze Orientale, Miss V. Tomlin, Mrs. R. C. Kingston, Lucy Kendal, and Madame Darrier in the front row. The second prize was won by the Bromley and District Chrysanthemum Society, blooms being contributed by Messrs. Blackburn, Blick, Brisser, Dove, Lyne, Parfield, Tapper, and Wheadon; this was a good set, and the Bromley society made a first-rate fight. The Barnet and District Society won the third prize.

HOLMES MEMORIAL AND TURNER CUPS.

There were no less than six entries in the class for thirty-six blooms of distinct incurved varieties, the Holmes Memorial Challenge Cup being the leading award, together with £10 given by Sir Edwin Saunders, president of the society. The premier award was won by Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Fetcham; the best stand of blooms, however, was sent by Mr. W. H. Lees, but unfortunately Princess of Wales and Mrs. Heale were associated in this stand, and so the judges had no option but to disqualify it. Mr. Higgs' varieties were Duchess of Fife, Mons. Desblanc, Golden Empress, Dorothy Foster, Globe d'Or, Madame Ferlat, John Lambert, Mrs. R. C. Kingston, Major Bonaffon, Robt. Petfield, and Lady Isabel, in the back row; Alfred Salter, F. W. Wilkinson, C. B. Whitnall, Mrs. R. King, Queen of England, Baron Hirsch, Lord Alcester, Mrs. J. Eadie, J. Agate, George Haigh, Ernest Cannell, and Empress of India, in the middle row; D. B. Crane, Austen Cannell, Miss Coleman, Sir T. Lawrence, Bonnie Dundee, Miss M. A. Haggas, Violet Foster, Jeanne d'Arc, Violet Tomlin, M.P. Martignac, Madame Darrier, and Princess of Wales, in the front row. The second prize was awarded to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, who had a good even set, including fine developments of C. H. Curtis, Baron Hirsch, Globe d'Or, and Lady Isabel; Mr. W. Mease was third, and Mr. F. G. Foster fourth.

The Holmes Memorial Challenge Cup and £10, offered as first prize for forty-eight Japanese, was won by Mr. W. H. Lees, gardener to F. A. Bevan, Esq., Trent Park, Barnet, who had a magnificent lot of flowers; in the back row were grand flowers of Surpasse Amiral, Australie, Lady Ridgway, Madame Carnot, Viviand Morel, Louise, Oceana, Mrs. W. H. Lees, Mrs. C. H. Payne, Elsie Teichmann, Phœbus, Madame M. Ricoud, Mons. Hoste, Sécrétaire Fierens, Reine d'Angleterre, and Mrs. H. Weeks; in the middle row were Chenon de Leche, Souvenir de Petite Amie, J. Bidencope, Mrs. Palmer, Souvenir de Madame Rosetti, Simplicity, N.C.S. Jubilee, Pride of Madford, Mutual Friend, Chas. Shrimpton, C. B. Haywood, Madame Rosseau, Mrs. Lewis, E. Molyneux, Madame P. Rivoire, and Ella Curtis; in the front row were Nellie Pockett, R. Powell, Edith Tabor, Mrs F. A. Bevan, Madeleine Davis, Miss D. Shea, Lady Byron, Col. Chase, Chas. Davis, Mrs. Mease, J. Chamberlain, Pres. Nonin, Chatsworth, Col. W. B. Smith, Seedling, and Madame G. Bruant. Mr. Frederick Vallis, Bromham Fruit Farm, Chippenham, came second, with a fine set of flowers, Mr. W. Mease third, and Mr. J. McHattie, gardener to the Duke of Wellington, Strathfieldsaye, fourth.

Mr. Norman Davis, Framfield Nurseries, Sussex, won the Turner Memorial Cup for three dozen Japanese blooms in twelve varieties, three blooms of each; Mr. Davis has now secured the cup for himself. The varieties shown by Mr. Davis were: Madame Carnot (beautiful), Joseph Chamberlain, President Nonin, Mutual Friend, Phœbus, E. Molyneux, S. C. Probyn, Oceana, Dorothy Seward, Madame G. Henry, General Roberts, and G. J. Warren (three magnificent blooms); Mr. W. J. Godfrey, Exmouth, won second prize, his J. Brookes, G. J. Warren, Le Grand Dragon, and Mrs. Mease being especially fine.

SPECIAL OPEN CLASSES.

There was a splendid competition in the class for two dozen Japanese blooms, for prizes offered by the chairman and directors of the Royal Aquarium to commemorate this the twenty-first exhibition of the N.C.S held at the Royal Aquarium. The first prize was £8 and a large gold medal, and as there were sixteen competitors the winner can afford to feel proud of his position. The chief honour was won by Mr. R. Kenyon, gardener to A. F. Hills, Esq., Woodford Green, Essex, who showed a beautiful set of substantial and finely-coloured blooms; the back row varieties were Madame G. Bruant, Phœbus, Lady Hanham, Mdlle. L. Brossillon, Mons. Hoste, Master Tucker, Soleil d'Octobre, and Mrs. Weeks; middle row—Madame G. Henry, John Neville, Edith Tabor, Mrs. C. H. Payne, C. Davis, Mrs. Mease, Viviand Morel, and Mons. Chenon de Leche; front row—N.C.S. Jubilee, Mr. J. Lewis, Sécrétaire Fierens, Mons. Desblanc, Mrs. Burkess, Mrs. Carrington, Dorothy Seward, and Mrs. G. Carpenter. The second prize was won by Mr. W. Mease, gardener to A. Tate, Esq., Leatherhead; Mr. H. Perkins, gardener to the Hon. W. F. D. Smith, M.P., Greenlands, Henley-on-Thames, third.

In the special class provided by Mr. H. J. Jones, Lewisham, for six blooms, two each of Madame Carnot, G. J. Warren, and Mrs. Mease, there was a good and close competition, Mr. W. Mease winning with splendid blooms of great substance; Mr. W. Higgs, second; and Mr. G. Foster, gardener to H. Hammond Spencer, Esq., Teignmouth, third. There were eight competitors.

INCURVED BLOOMS.

There were six entries in the class for twenty-four incurved blooms, distinct, and here the first prize was won by Mr. Higgs, who showed the following varieties, some of them immense flowers:—Duchess of Fife, Major Bonaffon, R. Petfield, Ma Perfection, Globe d'Or, J. Lambert, Mons. Desblanc, and Lady Isabel in the back row; Alfred Salter, Queen of England, Madame Ferlat, Mrs. J. Eadie, Golden Empress, J. Agate, Leonard Payne, and Ernest Cannell in the middle row; Lord Alcester, Mrs. R. C. Kingston, Jeanne d'Arc, Violet Tomlin, Empress of India, G. Haigh, Princess of Wales, and Baron Hirsch; Mr. W. Wilson, gardener to R. C. Christie, Esq., Bagshot, second; Mr. T. Robinson, third; and Mr. J. Agate, Havant, fourth.

Out of nine competitors in the open class for a dozen incurved blooms, distinct, Mr. G. J. Hunt was to the fore, winning with fine large blooms of Duchess of Fife, C. H. Curtis, J. Lambert, Mons. Desblanc, Empress of India, Mr. S. Coleman, Ma Perfection, Miss Dorothy Foster, Miss M. A. Haggas, Globe d'Or, Golden Empress, and Lord Alcester; Mr. W. Robinson came second, Mr. J. W. McHattie third, and Mr. W. J. Adams fourth. For six incurved blooms, one variety, there was a grand competition, the six sets staged being all splendid flowers, Mr. G. J. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, winning with immense globes of Duchess of Fife; Mr. W. J. Farmer, gardener to H. P. Leschalles, Esq., Windlesham, Surrey, second, with C. H. Curtis; and Mr. T. Robinson third with Miss Violet Foster.

JAPANESE BLOOMS.

There were seven entries in the class for six blooms of any one Japanese variety, Mr. Norman Davis winning with magnificent specimens of Madame Carnot; Mr. J. Agate came second with Jane Molyneux; and Mr. G. Elder, gardener to J. W. Benson, Esq., The Oaks, Walton-on-the-Hill, third, with Madame Carnot. The best half-dozen blooms of any Japanese chrysanthemum other than a yellow or white variety was won by Mr. J. W. McHattie with fine flowers of Australie; Mr. W. Slogrove, gardener to Mrs. Crawford, Gatton Cottage, Reigate, second, with Lady Hanham; and Mr. T. H. Lodge, third, with pale blooms of Viviand Morel. The best half-dozen yellow Japanese chrysanthemums, one variety, were fine blooms of Phœbus, shown by Mr. H. Shoesmith, Woking; Mr. J. Agate, second, with Mrs. W. Mease; Mr. G. Elder, third, with Phœbus; and Mr. McHattie, fourth, with Edith Tabor.

Mr. H. Perkins, gardener to the Hon. W. F. D. Smith, M.P., Henley, secured the chief award for half a dozen Japanese incurved blooms, showing J. Pockett, Pride of Madford, Pres. Bevan, Australie, Australian Gold, and Mdme. Gerard; Mr. Justice second, and Mr. W. Robinson third. Mr. H. Love showed the best half-dozen hairy chrysanthemums, staging moderate flowers of Beauty of Teurs, Mrs. Dr. Ward (2), Hairy Wonder (2), and Abbé Pierre Arthur; Mr. Justice second, and Mr. Batchelor, Harefield Park, Uxbridge, third In a second open class for a dozen Japanese blooms, distinct, there were eleven competitors, the first prize falling to Mr. W. Meredith, gardener to D. P. Sellar, Esq., Brentwood, who staged Chenon de Leche, Mdlle. Thérèse Rey, Pride of Madford, C. B. Haywood, Lady Hanham, Louise, Mrs. G. W. Palmer, Mons. C. Panckoucke, Lady Ridgeway, Mons. Hoste, G. Seward, and Chas. Davis; Mr. F. King second.

ANEMONE, POMPON, AND SINGLE VARIETIES.

The first prize for twenty-four large-flowered anemone blooms was won by Mr. W. King, gardener to J. Warren, Esq., Capel House, Waltham Cross, with handsome examples of Mdlle. R. Brun, Sir W. Raleigh, Mrs. Judge Benedict, Empress, Gladys Spaulding, Owen's Perfection, Juno, and Delaware in the back row; M. C. Lebocqz, Mrs. Hugh Gardiner, Mons. R. Owen, W. W. Astor, Queen Elizabeth, M. Dupanloup, J. Bunyan, and Cincinnati in the middle row; and Robin Adair, Lady Margaret, Enterprise, Ada Strickland, Jeanne Marty, Robert Burns, Mrs. P. R. Dunn, and Nelson in the front row. The second prize was won by Mr. W. Skeggs, gardener to A. Moseley, Esq., Hadleigh, Barnet; and Mr. J. Justice third. In the class for a dozen Japanese flowered anemones the chief award was secured by Mr. W. Robinson, gardener to the Right Hon. Lord Ludlow, Westbury, who had splendid examples of W. W. Astor, Mr. H. Gardiner, Sœur Dorothe Souille, J. Bunyan, Ower's Perfection, M. Dupanloup, Sir W. Raleigh, Enterprise, Mrs. Caterer, Ruche Lyonnaise, Robin Adair, and Jeanne Marty; Mr. W. Skeggs second, and Mr. J. Justice third.

Mr. J. Justice, gardener to the Right Hon. Sir R. Temple, Bart., Worcester, won first prize for a dozen bunches of anemone pompon varieties, showing Briolus, Bessie Flight, Chestnut, Mr. Astie, E. Rowbotham, Mr. Wyness, Francis Boyce, Antonius, Aglaia, Madame Montels, Sidonie, and Calliope. Mr. T. Caryer, gardener to A. G. Meissner, Esq., Alderholm, Weybridge, won first honours for a dozen trebles of pompon varieties; this was one ot the best stands seen for a long time, the varieties being Perle des Beautés, President, Toussaint Marizot, Mr. Holmes, Osiris, La Vogue, W. Westlake, Mdlle. Marthe, Black Douglas, Rubra Perfecta, Pygmalion, and Mdlle. Elise Dordan, all lovely flowers; Mr. W. Aldridge, Palmer's Green, second; and Miss Debenham, St. Albans, third.

The best dozen varieties of single chrysanthemums, three blooms of each, came from Mr. W. Aldridge, gardener to G. Lacey, Esq., Springfield House, Palmer's Green, who put up exceptionally fine blooms of Lady Churchill, Miss Brown, [illegible] Camoen, Alphonso, Miss A. Mumford, Framfield Beauty, Springfield Beauty, Purity, Rose Pink, Orange Beauty, Sir T. Symonds, and Oceana; Mr. Forbes second, and Mr. R. Pallant third. Mr. J. Justice had the best twelve large anemone blooms, winning with clean, well-developed examples; Mr. King second, and Mr. Ives third. Mr. T. Caryer was first for reflexed blooms, and Mr. W. Robinson second.

GROUPS AND SPECIMEN PLANTS.

Groups were good, but the specimen plants not up to the usual standard. The first prize for a group of chrysanthemums in pots, any varieties, mingled with foliaged plants, all to be grown by the exhibitors, to be arranged for effect in a space twelve feet in diameter, was won by Mr. J. Spink, Summit Road Nursery, Walthamstow, with a splendid arrangement of finely-grown chrysanthemums arranged most tastefully with Cocos Weddelliana, crotons, &c. These were three fine groups, the second prize falling to Mr. W. Howe, gardener to Sir Henry Tate, Bart., Park Hill, Streatham; Mr. E. Dove, gardener to W. E. Fry, Esq., [illegible] Hall, third.

Mr. T. Gilks, gardener to A. Morris, Esq., Court Green, Streatham, staged the finest set of six standard trained chrysanthemums, showing shapely, freely-flowered specimens of Bertier Rondatler, Cleopatra, Col. W. B. Smith, Bessie Chapman, Emily Silsbury, and Mrs. E. S. Trafford. For four standard trained specimens Mr. W. Davey, gardener to C. C. Paine, Esq., Haverstock Hill, was placed first for his well-grown examples of Wm. Tricker, Cleopatra, Stanstead Surprise, and Eva Knowles; Mr. F. E. Wright, gardener to J. Troup, Esq., Upper Clapton, second.

The six plants staged by Mr. Gilks were regarded as the best of the low-trained specimens; the varieties were Wm. Kennedy, W. Westlake, Fremy, St. Michael, Sœur Melanie, and Black Douglas; Mr. Gilbert, gardener to W. A. Sewell, Esq., Highgate, gained second prize with Japanese varieties. For four trained specimens, any varieties, Mr. F. E. Wright was first with Chas. Davis, J. Shrimpton, W. Tricker, and Col. W. B. Smith; Mr. Gilks second, and Mr. Davey third. In all cases the plants were large and covered with flowers. Mr. Davey was awarded second prize for a specimen plant of an incurved variety, showing C. H. Curtis in rather poor condition; Mr. Wright third with the same variety in standard form.

AMATEURS' CLASSES, DIVISION A.

The great progress made by amateurs in the cultivation of the chrysanthemum was fully sustained at this exhibition. The classes were mostly well contested, and the quality of the blooms was very good. Mr. Gladwell, gardener to Sydney Smith, Esq., Werndee Hall, South Norwood, was a good first for six Japanese with well-developed flowers of G. J. Warren, Phœbus, Mdlle. Marie Hoste, Madame Carnot, Reine d'Angleterre, and Mons. Chenon de Leche, thus outdistancing eight exhibitors; Mr. W. Perrin, gardener to C. W. Richardson, Esq., Sawbridgeworth, was second; and Mr. R. Chamberlain, gardener to F. M. Lonergan, Esq., Cressingham, Reading, was third. Mr. John Denyer, gardener to Edwin Smith, Esq., Ingleside, Chatham, was first for six blooms of one variety with Phœbus, Mr. J. Acock being second. Mr. G. E. Wilkins's exhibit of twelve incurved gained for him a silver medal and the first prize. He staged Lady Isabel, Ernest Cannell, Mrs. N. Molyneux, Globe d'Or, Mrs. R. C. Kingston, Perle Dauphinoise, C. H. Curtis, Mons. Desblanc, Madame Ferlat, Madame Yvonne Desblanc, Mrs. R. D. Douglas, and Mrs. R. Owen. Mr. A. Hooney, gardener to G. H. Cox, Esq., The Grange, East Barnet, was second. Mr. C. E. Wilkins also headed the five exhibitors of six incurved with nice fresh blooms; Mr. W. Leppard was second, and Mr. W. C. Pagram third. Messrs. Hooney and Wilkins were the successful exhibitors for six blooms of one incurved variety, staging C. H. Curtis and Austen Cannell respectively. Mr. A. Taylor was first for six bunches of pompons, and Mr. T. W. Preston was second.

Only three exhibits of eighteen Japanese were staged, and Mr. L. Gooch, gardener to T. Wickham Jones, Esq., South Norwood, was first with highly-developed blooms of International, Mr. G. W. Palmer, Edith Tabor, Mrs. H. Weeks, Pride of Madford, Australie, Mons. Panckoucke, Mons. E. Andre, Simplicity, Préfet Robert, Australian Gold, Charles Davis, Mutual Friend, Oceana, Mons. Chenon de Leche, Lady Hanham, Viviand Morel, and Madame Carnot; Messrs. A. Hooney and A. W. Seabrook were second and third respectively. The competition for twelve Japanese was very keen, Mr. W. A. Brown, gardener to H. W. Sillem, Esq., The Pines, Woking, heading the twelve exhibits with a splendid set of flowers; he staged Lady Ridgeway, G. C. Schwabe, Miss E. Teichmann, Modesto, Madame Carnot, Dorothy Seward, Lady Hanham, Edith Tabor, Viviand Morel, Charles Davis, Mrs. H. Weeks, and Pride of Madford Mr. R. Gladwell was a creditable second, and Mr. J. Acock third.

AMATEURS' CLASSES.—DIVISION B.

Only two exhibits of twelve incurved were staged, and Mr. R. Knight, Ashford, was first with very fair blooms of C. H. Curtis, Empress of India, Miss Violet Tomlin, Golden Empress, Madame Darrier, J. Kearns, Dorothy Foster, Bonnie Dundee, Jeanne d'Arc, Baron Hirsch, Miss M. A. Haggas, and Mrs. N. Molyneux; Dr. J. H. Sharpe, Bridgwater, was only a moderately good second. The prize-takers for six incurved were Messrs. G. P. Clark, A. R. Knight, and Sharpe.

Four exhibits of twelve Japanese were staged, and the premier award was made in favour of Mr. H. A. Needs, Heathview, Woking, who had well-grown blooms of M. George Biron, Lady Ridgeway, Madame Couvat du Terrail, Viviand Morel, Sunstone, Edwin Molyneux, Australie, Edith Tabor, Miss Elsie Teichmann, Oceana, Mrs. G. N. Palmer, and Wm. Seward; Mr. W. G. P. Clark was a good second, and Mr. F. Durrant third. Mr. H. A Needs also headed the five competitors for six Japanese with a nice even set of blooms; Messrs. W. G. P. Clark and W. Amies were second and third respectively. Mr. Norman Wrighton, Addiscombe, was first for six blooms of one variety, with massive samples of Phœbus, Mr. Henry Love being second.

Mr. A. R. Knight gained the silver cup offered by Mr. G. P. Linford for eighteen Japanese with fine flowers of J. Brookes, Viviand Morel, Mutual Friend, Simplicity, Modesto, Etoile de Lyon, Milano, Charles Davis, Sunstone, Mrs. F. A. Bevan, Mrs. C. H. Payne, Lady Hanham, Edith Tabor, Mary Molyneux, Surpasse Amiral, Eva Knowles, Madame G. Henry, and Mrs. G. W. Palmer; Mr. Martin Silsbury, Shanklin, was a very close second, and Mr. Henry Love, Sandown, I.W., third.

MAIDEN CLASSES.

No less than sixteen competitors tried conclusions in the class open to those who had never won a prize at the shows of the society, and the first prize was well gained by Mr. Folkes, who had nice blooms of Edith Tabor, Graphic, Madame Ricourd, Australie, Mrs. C. W. Palmer, and N.C.S. Jubilee. Mr. A. G. Clinton, Glendevon, Horsell, Woking, was a close second; and Mr. T. Parkins, gardener to F. W. F. Ward, Esq., 34, Bisham Gardens, Highgate, was third. There was a spirited competition for three Japanese, and Mr. Folkes was again the successful exhibitor. Messrs. Clinton and G. Hagon were second and third respectively. Mr. J. Coomber, gardener to Mrs. Saunders, Warren Lodge, Kingston Hill, headed the eight exhibitors of six incurved blooms with nice flowers of Duchess of Fife, Globe d'Or, Baron Hirsch, C. H. Curtis, Miss Violet Tomlin, and Princess of Wales. Mr. G. Hobday, Havering Road, Romford, was a very fair second, and Mr. H. Folkes third. Messrs. Poole, Folkes, and Foster were the prize-winners for three incurved.

FLORAL DESIGNS.

The competition in the classes designed to display to the full the decorative character of the chrysanthemum was splendid, and the quality of the exhibits was good throughout. The epergnes and the table of floral designs were especially good.

A grand table of floral designs from Messrs. Perkins and Sons, Coventry, secured the chief honour for such a display; there were lovely bouquets, crosses, vases, baskets, stars, harps, and other designs in variously-coloured chrysanthemums associated with suitable foliage. It was a fine and tasteful exhibit. Miss E. Erleback, Stoke Newington, was second, and Mr. W. Hayward, Kingston-on-Thames, third.

In the class for three epergnes of chrysanthemum blooms suitable for table decoration there were no less than nine entries, these making a grand display in themselves; the premier award was won by Miss C. B. Cole, Feltham, who had pretty light designs in orange, deep yellow, and rose-coloured blooms associated with asparagus and croton foliage; Mr. Seale, Sevenoaks, second; and Mrs. W. Green, jun., third. Mr. D. B. Crane had a fine exhibit, but he had faced his designs too much. Six hand baskets of chrysanthemums were staged, and the best one came from Miss Easterbrook, Fawkham, Kent, who had a grand exhibit of yellow and white flowers mixed with Asparagus plumosus, and A. Sprengeri; Miss C. B. Cole second, and Mrs. Strugnell third.

There were eleven entries in the class for a vase of Japanese blooms, Mr. T. Perkins, gardener to F. W. F. Ward, Esq., Highgate, coming first; Mr. R. Chamberlain second, with Phœbus, and Mr. C. Jones third. The best pair of chrysanthemum bouquets were shown by Mr. Mark Webster, and reflected great credit upon this successful exhibitor; Mr. J. Mansey, Islington, second. For a pair of vases of pompon varieties Mr. Mark Webster, gardener to E. J. Preston, Esq., Kelsey Park, Beckenham, was first prize-winner out of five competitors; Mrs. W. Green, jun., Harold Wood, second; and Mr. W. G. Pagram, gardener to J. Courtenay, Esq., Weybridge, third.

Six competitors came forward in the class for a vase of six Japanese blooms, one variety, arranged with any foliage, and here Mr. J. King, gardener to J. G. Lloyd, Esq., Itchel Manor, Hants, came first with a handsome vase of Edith Tabor; T. H. Lodge, gardener to Mrs. Meret, Bishops Stortford, second with Madame Carnot, and Mr. G. W. Forbes third. Miss Easterbrook showed the best basket of autumn foliage and berries, making a pretty show with physalis, berberis, privet, snowberries, maple, and honeysuckle foliage; Mr. A. Webb, Barnet, second, and Mrs. W. Taylor third.

Fruit.

There was not so much fruit exhibited as on some former occasions, but the competition was keen in each class, and the quality extremely good. In the class for six dishes of culinary apples seven exhibits were staged, and the premier award was made in favour of Mr. W. Stowers, gardener to G. H. Dean, Esq., Sittingbourne, who had splendid examples of Mère de Ménage, Lane's Prince Albert, Glory of England, Peasgood's Nonsuch, Bramley's Seedling, and Emperor Alexander; Mr. A. J. Thomas, Burgam's Hill, Rodmersham, was a good second; and Mr. H. Berwick, The Nurseries, Sidmouth, third. There were also seven exhibits in the class for six dishes of dessert pears, and Mr. A. J. Thomas was first with tempting fruits of Pitmaston Duchess, Columbia, Maréchal du Cour, General Todleben, Princess, and Beurre Lamoyeau; Mr. H. Berwick was a close second with only slightly inferior samples; and Mr. R. Potter, gardener to Sir M. W. Collet, Bart., St. Clere, Sevenoaks, third. Mr. H. Berwick gained premier honours for six dishes of dessert apples with well-coloured samples of Ribston Pippin, Melon Apple, American Mother, King of the Pippins, Wealthy, and Adams' Pearmain; Mr. A. J. Thomas was a good second, and Mr. W. Stowers third. Five sets of three bunches of white grapes were put up, Mr. W. H. Lees, gardener to F. A. Bevan, Esq., Trent Park, New Barnet, being first; Mr. C. W. Cole, Feltham, second; and Mr. W. Taylor, gardener to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, third. Each competitor staged Muscat of Alexandria. Mr. W. Howe, gardener to Sir H. Tate, Bart., Park Hill, Streatham Common, was first for three bunches of Alicante, with finely-coloured bunches; Messrs. Taylor and Maycock were second and third respectively. Messrs. Taylor and Milson were the prize-takers in the class for three bunches of Gros Colmar, each staging remarkably fine bunches.

Vegetables.

The special feature of this section was the keen competition for the prizes offered by Mr. Sydenham and the success of our coadjutor, Mr. Beckett. There was a spirited competition for the prizes offered by Messrs. Sutton and Sons, Reading, for nine dishes of potatos of their own introduction. Nine collections were staged, Mr. E. S. Wiles, gardener to the Hon. Evelyn Hubbard, M.P., The Rookery, Down, Kent, being first. He staged grand tubers of Satisfaction, Reliance, Sutton's Seedling, Windsor Castle, Invincible, Reading Russet, Supreme, Ideal, and Abundance. This was a very fine exhibit. Mr. S. Cole, gardener to the Right Hon. Earl Spencer, K.G., Althorp Park, Northampton, was a very close second; and Mr. A. Basile, gardener to the Rev. A. L. Powels, Woburn Park, Weybridge, third. Mr. S. Cole headed the eleven competitors in the class for two dishes of potatos with fine tubers of Supreme and Windsor Castle. Mr. H. Foulkes, gardener to E. Strachan, Esq., Goddesden Place, Hemel Hempstead, was a highly creditable second, and Mr. E. S. Wiles third.

Five collections of nine varieties were staged in competition for the prizes offered by Messrs. Webb and Sons, Stourbridge, and the successful exhibitor was Mr. E. Beckett, gardener to the Right Hon. Lord Aldenham, Aldenham House, Elstree, whose exhibit evinced cultural skill of no mean order. He staged Colossal leeks, Defiance carrots, Motor potatos, Autumn Giant cauliflowers, Webb's Masterpiece onions, Sensation tomatos, Mammoth red celery, Hollow Crown parsnip, and Matchless Brussels sprouts. Mr. R. Lye, gardener to Mrs. Kingsmill, Sydmonton Court, Newbury, was a good second with fine produce; and Mr. A. Basile third.

The prize offered by Mr. Sydenham evoked a spirited competition, and the general quality of the produce must have been very gratifying to him. There were seven entries for three cauliflowers, and Mr. J. Read, gardener to the Earl of Carnarvon, Bretby Park, Burton-on-Trent, was first with firm heads; Mr. R. Lye, gardener to Mrs. Kingswell, Sydenham Court, Newbury, was second; and Mr. A. Basile third. Mr. E. Beckett gained premier honours for three savoys; Messrs. Basile and Read being second and third respectively. Mr. Read headed the six exhibitors of three red cabbages with fine samples; other prizes being awarded to Messrs. E. Beckett and Basile in the order named. Six exhibits of six sticks of celery were staged, and the successful prize-takers were Messrs. Folkes, Lye, and Beckett. The first prize lot was a splendid exhibit. Mr. Folkes was also first for three stems of Brussels sprouts, Mr. Beckett second, and Mr. T. Wilkins third. Mr. W. Pope gained premier honours for six carrots with nice straight roots; Mr. E. Brown was a close second, and Mr. H. Folkes third. Messrs. Brown, Wilkins, and Basile were the successful exhibitors of six beets. Mr. Beckett was an easy first for six parsnips; Messrs. Read and Basile were second and third respectively; while the awards for six leeks were made in favour of Messrs. Lye, Wilkins, and Becket, all of whom staged the variety known as the Lyon.

There were five exhibits of eight onions, and the awards were made in favour of Messrs. Beckett, Folkes, and Wilkins. Mr. Beckett also headed the six exhibitors of two dishes of potatos with fine tubers of Windsor Castle and Snowdrop; Messrs. Folkes and Lye were the other prize-takers. Messrs. Lye, Folkes, and Read gained awards for their exhibits of eight turnips. Eight dishes of tomatos were staged, and the awards were made in favour of Messrs. Beckett, Read, and Folkes, each of whom showed the variety Perfection, a term which might well be applied to the samples on view. A silver cup, valued at fifteen guineas, was offered to the exhibitor who gained the greatest number of points in all the classes of this section, and it is gratifying to state that Mr. Beckett was the lucky recipient, thus showing by practice the excellence of his teaching in the articles on cultivating vegetables for exhibition which have recently appeared in these columns.

Non-competitive Displays.

One of the most attractive of the non-competitive displays was the gigantic exhibit put up by Mr. H. J. Jones, Ryecroft Nurseries, Lewisham; his exhibit was in three parts, a large central table of vases and stands of cut blooms representing all the newer varieties, and then a large group of plants on either side of this. The vases of blooms were most tastefully put up, and over a groundwork of crotons, ferns, &c., bunches of brightly-coloured early flowering varieties. In the stands we made note of Mrs. Mease, Mrs. Mary Underhay, G. J. Warren, Rayonante, &c. The groups of plants were well put up, backed by bamboos, and fronted by a few crotons and ferns, these foliage plants not being mixed with the chrysanthemums as on former occasions. Mr. H. J. Jones thoroughly deserved the gold medal awarded, for he made a famous display. Space limits prevent us from detailing the many new and rare varieties exhibited.

A grand exhibit came from the home of flowers, Swanley, Kent, the Messrs. H. Cannell and Sons gaining a gold medal for their extensive and comprehensive exhibit, which consisted of banks of brilliant cannas in pots, pelargoniums in great variety, and a representative collection of the newer chrysanthemums, making a showy bank of bloom. Some of the most prominent varieties were Lady Hanham, Ella Curtis, Mrs. T. A. Compton, Mrs. W. Mease, Edith Tabor, N.C.S. Jubilee, Souvenir de Molines, Miss Sanderson, Marie Calvat, President Bevan, and Chatsworth.

A first-class exhibit was put up by Mr. W. J. Godfrey, Exmouth. At the back Mr. Godfrey put up large spray-like vasefuls of President Nonin, Golden Harvest, Captain Bellamy, a good yellow, &c. The single specimen cut blooms numbered about eighty to a hundred, and were fine examples: Miss G. Vanderbilt, G. J. Warren, R. Powell, Mrs. Bryce, Princess Charles of Denmark, Wilfred Godfrey, Mrs. Mease, Ella Curtis, Lady Ridgeway, Le Grand Dragon, and Mrs. E. Shrimpton were notably and conspicuously good. A silver-gilt medal was awarded to this celebrated Devonshire grower and exhibitor.

A large table of plants exhibited by Messrs. B. S. Williams and Son, Holloway, secured a small gold medal. Winter-flowering begonias, heaths, solanums, and Acalypha Sanderi were conspicuous, but the chief attractions were the orchids, which included a fine collection of cypripediums, calanthes, Oncidium crispum, O. varicosum, dendrobiums, and cattleyas. Mr. Robert Owen, Maidenhead, was awarded a silver-gilt medal for a collection of new varieties, in which were some promising novelties, such as La Tzigane, Mrs. Winkley Smith, Mrs. W. Mease, Mary Molyneux, Thomas Singleton, Sir Herbert Kitchener, Lord Cromer, Paul Oudot, and Charles Page. The group of chrysanthemums staged by Messrs. John Peed and Sons, Roupell Park Nurseries, Norwood, well deserved the silver medal which was accorded to it.

Messrs. J. Laing and Sons, Forest Hill Nurseries, were awarded a silver-gilt medal for a well-grown collection of conifers and berried shrubs. A gold medal was awarded to Messrs. W. Cutbush and Son, Highgate, for their contribution, in which some very fine chrysanthemums, lily of the valley, and carnations were to be seen. T. S Ware, Limited, Tottenham, showed a table of new chrysanthemums, together with a few late dahlias, chiefly cactus varieties, and was awarded a small silver medal. Mr. John Russell, Richmond, Surrey, had a first-rate exhibit of ivies in great variety, the golden and silver variegated forms being well represented. This was accorded a silver medal. A pretty table decoration of chrysanthemums and autumn foliage was shown by Mr. J. Williams, Oxford Road, Ealing.

Miscellaneous Exhibits.

Messrs. C. P. Kinnell and Co., Southwark Street, S.E., had an exhibit of their well-known boilers and other greenhouse sundries. Rustic terra-cotta pots came from Messrs. D. Dowel and Son, Ravenscourt Avenue, W.; and the Agricultural and Horticultural Association (Limited), who had an exhibit, and Mr. J. Arnold, 32, St. Paul's Road, London, N.W., were also in evidence. The Permanent Nitrate Company, Gracechurch Street, E.C., exhibited their wares, and also a large collection of farm and garden produce. The Ichthemic Guano Company and the Lawes Chemical Manure Company each had an exhibit of their specialities, and both staged blooms grown with the aid of their fertilisers. Mr. John Pinches, Crown Street, Camberwell, had an exhibit of his well-known useful indestructible labels and a few other sundries; Mr. J. George, Redgrove Road, Putney, had a large exhibit of horticultural sundries, including Thomson's vine and plant manure, and baskets of fine Gros Colmar grapes grown with its aid; Mr. Howes showed his patent watering cans; Messrs. Fenton and Son, Tudor Street, E.C., sent specimens of their heating apparatus, notably their Kozmopolite condensing stove; Mesrrs. Dosby and Sons, King's Cross, staged heating apparatus specially suitable for amâteurs' conservatories.

HORNSEY CHRYSANTHEMUM SOCIETY, November 1 and 2.

THE ninth annual exhibition of the above society was held on the above dates in the National Hall, Hornsey, and although the entries were, unfortunately, not so numerous as usual, the show may be pronounced a success. Unfortunately, to the bad weather on the second day was due a marked falling off in the attendance, and consequently a diminution in the receipts.

CUT BLOOMS were of good quality, although the entries in the various classes were not so numerous as could be desired, and it is to be hoped that next year there will be an improvement in this respect. For eighteen Japanese the prize was awarded to Mr. W. Austin, Eastfield Road, whose best blooms were Viviand Morel, Colonel W. B. Smith, Edith Tabor, Louise, Lady Byron, Mrs. Trafford, Excelsior, and Charles Davis. Mr. A. F. Bongard, Corrie Glyn, Hertford Road, Hornsey, was first in the class for twenty-four Japanese, staging magnificent blooms of Viviand Morel, William Seward, Mdlle. Thérèse Rey, Mons. Gruyer, E. Silsbury, Oceana, Pride of Madford, Commandant Blissett, Lady Hanham, Van der Heede, Mons. Panckoucke, Mrs. E. Teichmann, Hairy Wonder, International, Mdlle. G. Henry, Eva Knowles, Edith Tabor, Australie, C. Davis, J. Myers, Phœbus, G. Schwabe, and Mutual Friend. Mr. F. J. Matthews, Warrington Road, Crouch End, was second. Mr. T. L. Turk, gardener to T. Boney, Esq., Southwood House, secured the premier award for twelve Japanese distinct with very good blooms of Reine d'Angleterre, Préfet Robert, Edith Tabor, James Bidencope, Mons. C. de Leche, Lady Ridgeway, Commandant Blussett, Mutual Friend, Pride of Madford, Graphic, and Robert Powell. The second prize was allotted to Mr. H. C. Green, gardener to W. B. Lister, Esq., Ladywell, Church Lane, Hornsey. Mr. Turk was first for six Japanese and six incurved, his Japanese being good blooms of James Bidencope, Mutual Friend, Commandant Blussett, Pride of Madford, Lady Ridgeway, and Edith Tabor; the incurved were Baron Hirsch, Leonard Payne, Brookleigh Gem, Refulgens, Globe d'Or, and M. R. Bahaunt. Mr. Green secured the other award. For twelve Japanese, not less than nine varieties, the prizes went to Mr. Bongard and Mr. B. R. Durrant, the former's stand containing nice blooms of William Seward, Charles Davis, Mutual Friend, Mdlle. Thérèse Rey, Mons. Chrétien, Madame G. Henry, Pride of Madford, E. Silsbury, G. C. Schwabe, and Lady Derby. Mr. Durrant was, however, first for twelve Japanese distinct, his best blooms being Phœbus, John Seward, Louise, Colonel W. B. Smith, Pride of Madford, Swanley Giant, and Mdlle. Lacroix; Mr. Bongard was second. To Mr. J. Brooks, gardener to W. W. Reynolds, Esq., J.P., The Grove, Hornsey, was awarded the first prize in the class for eighteen Japanese, nine varieties, and two of each variety; he staged excellent examples of Madame Gustave Henry, Reine d'Angleterre, Pride of Madford, Mrs. Mease, Mutual Friend, M. Chenon de Leche, Viviand Morel, Phœbus, and President Borel. Mr. Bongard was again first for twelve Japanese, two of each of six varieties, with good blooms of Mons. Chrétien, Phœbus, Eva Knowles, Madame Gustave Henry, Van der Heede, and William Seward; Mr. F. J. Matthews, Barrington Road, Crouch End, secured the other award. Mr. Bongard was also first for six Japanese of one variety, with excellent specimens of Phœbus, whilst a fine bloom of Oceana secured him the premier award for a single specimen cut bloom in vase. In this class Mr. Durrant, with a good bloom of Gustave Henry, was second. Mr. Durrant was, however, first for twelve Japanese, distinct, with good examples of William Standring, Lady Byron, Mons. Panckoucke, Pride of Madford, Mutual Friend, Phœbus, Mons. O. Lallimond, Edith Tabor, Elthorne Beauty, and Louise; Mr. Matthews was second. Again was Mr. Durrant first, this time with six incurved, distinct, his best blooms being Baron Hirsch, Duchess of Fife, and Madame Darrier. A really excellent stand was that staged by Mr. F. Seagrief in the class for twelve Japanese for those who had not previously taken a prize, who showed fine blooms of Madame Carnot, William Seward, Phœbus, Elaine, Gloire de Rocher, Charles Davis, and Viviand Morel. Mr. Austin secured the premier award for six incurved distinct with blooms of Jeanne d'Arc, Globe d'Or, C. H. Curtis, Duchess of Fife, Baron Hirsch, and Brookleigh Gem. Mr. Green was first for twelve Japanese distinct with really fine examples of Graphic, Phœbus, Edwin Molyneux, A. Gold, Commandant Blissett, Viviand Morel, Trafford Utopia, Charles Davis, Sunflower, Mrs. C. Hill, and Lady Randolph. Mr. J. Brooks was the successful exhibitor in the class for eighteen Japanese, distinct, with very fine blooms of M. Chenon de Leche, Viviand Morel, Mrs. Mease, Pride of Madford, Australie, Simplicity, Louise, Dr. Seward, Mrs. G. Andre, Phœbus, Mutual Friend, Madame Borel, Robert Powell, Edwin Molyneux. Madame Gustave Henry, Graphic, Edith Tabor, and Reine d'Angleterre. For six incurved one variety very good specimens of Baron Hirsch secured Mr. Turk the premier award, Mr. Saunders, gardener to G. Hayes, Esq., being second with Globe d'Or, and Mr. F. C. Green, gardener to W. B. Lister, Esq., third with Baron Hirsch. Mr. Turk was also first for six distinct incurved, staging good blooms of Leonard Payne, Baron Hirsch, Mrs. Bonn, Brookleigh Gem, Globe d'Or, and Mons. R. Bahaunt; Mr. Green was second. Mr. Turk was also first in the class for thirty-six pompons, staging excellent examples of Fremy, Mdlle. Elise Dordan, Maid of Kent, Nelly Rainford, Comte de Morny, William Westlake, Rosinante, Mrs. Holmes, President, Osiris, and Madame Marthe. The second award went to G. Saunders. For six bunches of pompons Mr. Austin secured the premier award, his best blooms being Black Douglas, Madame Marthe, Comte de Morny, W. Westlake, Adonis, and Prince of Orange.

Groups and Specimen Plants.—In the class for a group of chrysanthemums not to exceed fifty square feet the first prize went to Mr. H. Ward, gardener to H. T. Eve, Esq., Q.C., Hermiston, whose group contained some very fine flowers, although the arrangement was not so good as might be desired. The second prize went to Mr. G. Saunders. Mr. Durrant secured the award for a group of chrysanthemums not to exceed thirty feet with an exceedingly tasteful arrangement. For six plants Mr. Austin was first, with Mr. J. Bainbridge second, and Mr. J. Newman third; whilst for one plant Mr. Seagrief secured the award. Mr. Seagrief was also the successful exhibitor in the class for two plants.

Fruit and Vegetables.—Mr. Dunn was first for three bunches of blackgrapes, whilst for three dishes of dessert apples the first prize went to Mr. Brooks and Mr. A. Newman, gardener to C. W. Nicholls, Esq., Rokesby. Mr. Brooks was also successful with three dishes of cooking apples, with Mr. Turk and Mr. Newman second and third. For a collection of vegetables the prizes went to Mr. Stovel, Mr. Newman, and Mr. Durrant.

A very tasteful arrangement of flowers and plants, for which was awarded a silver medal, was staged by Mr. A. MacGregor, Prospect Nursery, Turnpike Lane, Hornsey, whilst a splendid collection of fruit was kindly exhibited by Alderman Sir M. Samuel, The Mote, Maidstone.

REIGATE CHRYSANTHEMUM SOCIETY, November 3.

The tenth annual exhibition held on the above date at the Public Hall fully sustained, even if it did not increase, the enviable reputation which has been gained by this society for its interesting shows. Unfortunately the entries were not quite so large as on some previous occasions, but the quality of the exhibits was very good. There was a slight falling off in the classes allotted to cottagers, for which the recent drought must be held responsible.

Groups and Plants were well represented, and constituted a pleasing feature. For a group of chrysanthemums arranged on a space occupying fifty superficial feet Mr. J. B. Mead, gardener to M. Marcus, Esq., High Trees, Redhill, gained the first prize with a collection in which there were about two hundred blooms, and Mr. W. Cooper, gardener to P. Paddock, Esq., who was second, only succeeded in missing the premier honour in consequence of the somewhat faulty arrangement. Mr. J. Fitt, gardener to F. C. Campion, Esq, Colley Manor, was third. The smaller groups were almost equally good, and Mr. W. Hunt, gardener to G. Jackson, Esq., Cherchefille, gained the first prize with a superb group, Mr. W. Seaman being second. The group of pompons made a nice change, and the premier award was made in favour of Mr. G. Smith, gardener to R. W. Myles, Esq., Craigendowie, the second prize going to Mr. A. J. Dodd, gardener to Mrs. Campion, The Frenches, Redhill. Mr. G. Stonnard, gardener to Sir A. T. Watson, Reigate Lodge, and Mr. G. Steer, gardener to P. Mordan, Esq., Stone House, were the successful competitors in the class for three bush specimens of Japanese varieties, and the positions of these two exhibitors were reversed in the class for six pompons in pots. The primulas staged were much better than is usually the case at this show, and for six plants the prizes were awarded to Mr. Steer, Mr. Cotton, and Mr. Seaman in the order named. The successful exhibitors of six cyclamen were Mr. Hunt, Mr. Smith, and Mr. Steer; for six table plants Mr. Mead, Mr. Dodd, and Mr. Smith were the prize-takers, and for six solanums the awards were made in favour of Mr. Smith and Mr. Fitt.

Cut Blooms were of the usual good quality, although the competition was not quite so keen as on some occasions. For thirty-six Japanese Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, was awarded the first prize with a fine, even set of blooms. He staged Australie, Phœbus, Lady Byron, Pride of Madford, Robert Powell, C. B. Haywood, A. H. Fewkes, Charles Davis, Colonel W. B. Smith, Edith Tabor, Edwin Molyneux, Mons. H. Jacotot fils, Graphic, Leonard Brown, Madame Carnot, Madame Marius Ricoud, Mons. Chenon de Leche, Mons. Panckoucke, Mrs. Harman Payne, Mrs. Lees, Mrs. J. Lewis, Mrs. Maling Grant, Mrs. N. C. Robin, N. C. S. Jubilee, Oceana, Pride of Hokell, Nellie Pockett, Werther, William Seward, Reine d'Angleterre, Viviand Morel, Mrs. Barks, Mons. Hoste, Lady Ridgeway, Mdlle. Garielle Seince, and Madame Desblanc. In the second prize stand, shown by Mr. W. Slogrove, gardener to Mrs. Crawford, Gatton Cottage, were remarkably fine blooms of Mrs. H. Weeks, President Nonin, and Mutual Friend. Mr. Dodd and Mr. King, gardener to J. Colman, Esq., Gatton Park, were awarded prizes in the order named for two dozen Japanese, both staging grand blooms, and Mr. W. Hunt headed the competitors for twelve Japanese. As in the previous class there was a spirited competition for six blooms distinct and six of one variety; in the former case the first prize was gained by Mr. S. J. Crofts, gardener to W. D. Freshfield, Esq., The Wilderness, and in the latter by Mr. W. King.

The classes for incurved blooms were not quite so well represented as the Japanese, either as regards number or quality of the flowers. There were only two exhibitors of twenty-four Japanese, and the first collection was staged by Mr. C. J. Salter, who had representative examples of Alfred Lyne, C. H. Curtis, Austin Cannell, Brookleigh Gem, Baron Hirsch, D. B. Crane, Duchess of Fife, Globe d'Or, Jeanne d'Arc, Mr. Murray, Lord Wolseley, Prince Alfred, Novelty, Yvonne Desblanc, Madame Darrier, Dorothy Foster, Mons. Martignac, Mrs. C. H. Kingston, Ma Perfection, Miss M. A. Haggas, Miss Violet Tomlin, Lady Isabel, Emile Nonin, and M. Lucile de la Drome. Mr. W. King was a close second. Prizes were awarded as written to Messrs. Dodd and Steer for twelve incurved, to Mr. Crofts, who was also first for six blooms of one variety, and Mr. Slogrove for six distinct incurved.

The successful exhibitors of twelve reflexed in not less than eight varieties were Messrs. Salter and Steer, who had blooms of high quality, while Mr. Cotton was first for six varieties. Messrs. Salter and Dodd received awards for their exhibits of twelve anemones, and the prize-takers for twelve pompons were Messrs. Steer, Salter, and Dodd. The blooms were for the most part of good quality, and produced a bright display. Mr. Crofts was first in each class for six anemones and six pompons. The president's prize offered for nine Japanese varieties, three blooms of each to be shown with foliage, was very strongly contested, and was gained by Mr. W. Slogrove.

PUTNEY AND WANDSWORTH CHRYSANTHEMUM SOCIETY, November 3 and 4.

The above society celebrated its coming of age by holding an excellent show on the above dates in the Wandsworth Town Hall, a show which proved to be in every way a great success.

Groups and Specimen Plants.—As usual these were a great feature of the show. For a group of chrysanthemums not to exceed 40 feet super a magnificent exhibit of fine flowers, well staged, secured to Mr. Tew, gardener to Mrs. E. Gordon, Westcombe Lodge, Park Side, the premier award, Mr. C. Taylor, Belmont Gardens, Wimbledon Common, being second. The exhibits in the class for a miscellaneous group were all of very good quality, Mr. A. Methven, gardener to W. Keiller, Esq., Fernwood, Wimbledon Park, being first with a very tasteful arrangement. The other awards were made in favour of Mr. C. Taylor and Mr. Pett, gardener to J. Dickie, Esq., Lower Park, Putney Hill. In the class for two large-flowered chrysanthemums Mr. G. Mynett, gardener to J. Carlisle, Esq., Ashburton House, Putney Heath, was first, with Mr. C. Bentley, gardener to Major Bosworth, Cedar Court, Roehampton, second. Mr. Mynett and Mr. Bentley also secured the same awards for two Japanese, whilst for a single specimen incurved the successful exhibitors were Mr. Bentley, Mr. Grimsell, gardener to W. Graham, Esq., and Mr. Twilley, Merton Road, Wandsworth. Mr. Bentley secured the awards for single specimen Japanese and a standard pompon, and he was also first for a single specimen pompon; Mr. Mynett and Mr. Grimsell were second and third respectively. Mr. Mynett was, however, first for an untrained bush plant, the other awards going to Mr. Twilley and Mr. Tew. Mr. French, gardener to Mrs. Barclay, Ambleside, Wimbledon Park, was first for six plants, single stem Japanese, Mr. Mynett second, and Mr. Dark, gardener to J. Hooker, Esq., Lomond House, Putney, third.

Cut Blooms were numerously staged and of good quality. In the big class of thirty-six Japanese, twelve incurved and twelve Japanese incurved, in which a handsome cup of the value of twenty-five guineas was given by the local tradesmen. Mr. G. J. Hunt, gardener to Pantia Ralli, Esq.. Ashtead Park, Epsom, who won the cup last year, was again successful, and thus wins the cup outright. The incurved he staged were fine blooms of Globe d'Or, Charles Curtis, Violet Tomlin, Mons. Desblanc, Golden Empress, Miss Violet Foster, Ma Perfection, Miss Dorothy Foster, Empress of India, Madame Darrier, John Lambert, and Duchess of Fife; this latter bloom was awarded the prize for the best incurved in the show. The Japanese incurved were: Duke of Wellington, Oceana, Pride of Madford, Louise, Mrs. Carrington, Robert Powell, Lady Ridgeway, Swanley Giant, Australie, Master H. Tucker, N.C.S. Jubilee, and President Nonin. The Japanese were magnificent examples of Graphic, Ella Curtis, Etoile de Lyon, Viviand Morel, Rose Wynne, Lady Hanham, Mrs. Richard Jones, Mary Molyneux, Lady Byron, Eva Knowles, Edith Tabor, Yellow Carnot, Mrs. J. Lewis, Lanawee, Mons. Chenon de Leche, John Seward, Mons. Gruyer, Simplicity, E. Molyneux, Mrs. W. H. Lees, Mephisto, Pride of Exmouth, G. W. Palmer, Mutual Friend, Madame Marius Ricoud, Mdlle. Thérèse Rey, Modesto, International, Jules de Ferry, Phœbus, La Moucherotte, Mons. Panckoucke, Niveus, M. Sillander, Mons. Hoste, and Admiral. Mr. F. King, gardener to A. F. Perkins, Oakdene, Holmwood, Surrey, was awarded the second prize, and amongst his blooms were noticeable: Phœbus (awarded the prize for the best Japanese bloom in the show), John Seward, Lady Hanham, and Ella Curtis. The third prize went to Mr. J. F. McLeod, gardener to J. C. Morgan, Esq.. Dover House, Roehampton.

Mr. Bentley secured the premier award for twenty-four incurved, the best blooms he staged being Lady Isabel, Lord Wolseley, Charles Curtis, Prince Alfred, Empress of India, Violet Tomlin, Jeanne d'Arc, Lucy Kendall, Empress Eugénie, M. Darrier, Refulgens, Mrs. S. Coleman, Brookleigh Gem, Mrs. C. R. Kingston, Baron Hirsch, Queen of England and Globe d'Or; Mr. French was second, noticeable on his stand being good blooms of Ernest Cannell, Baron Hirsch, Mrs. R. C. Kingston, and J. Agate. Mr. Bentley was also first for twelve incurved, his exhibit containing fine examples of Prince Alfred, J. Agate, Lord Wolseley, Lady Isabel, Queen of England, C. H. Curtis, M. Darrier, Baron Hirsch, Violet Tomlin, Brookleigh Gem, Globe d'Or, and Mrs. R. C. Kingston. The second prize went to Mr. French. Mr. J. Smith, gardener to the Lady Superior, The Convent Gardens, Roehampton, was first for six incurved, distinct, staging good blooms of Violet Tomlin, D. B. Crane, Baron Hirsch, Globe d'Or, Brookleigh Gem, and Miss M. A. Haggas. The other prize went to Mr. Mynett. In the class for twenty-four Japanese, distinct, Mr. Dark was the most successful exhibitor, staging splendid blooms of Australie, Phœbus, Mr. S. C. Roby, G. Palmer, E. Molyneux, Oceana, Lady Byron, Mons. Panckoucke, Duke of Wellington, James Bidencope, E. Andre, Elsie Teichmann, International, Edith Tabor, President Borel, Charles Davis, William Seward, C. Smith, Robert Powell, Chenon de Leche, Surprise, Louise, Eva Knowles, and Mutual Friend; Mr. French was second. Mr. Smith secured the premier award for twelve Japanese, distinct, with fine examples of Pride of Madford, J. Shrimpton, Colonel W. B. Smith, Sunflower, Mdlle. Thérèse Rey, W. Wright, Mrs. C. H. Payne, Robert Powell, C. Davis, Lady Tait, and James Bidencope. The second prize went to Mr. French. Mr. Mynett, Mr. Dark, and Mr. Bentley were the successful exhibitors in the class for six Japanese, distinct, Mr. Mynett's blooms being Phœbus, Pride of Madford, Mdlle. Thérèse Rey, President Borel, Mrs. S. C. Probyn, and Robert Powell. Mr. Bentley secured the award for six reflexed, with good examples of Cloth of Gold, Dr. Sharp, Chevalier Domage, Pink Christine, Cullingfordi, and Golden Christine. He was also successful for twelve bunches of pompons, the best being Laciniatum, Lady Dorothy, Black Douglas, Mr. Austin, Mdlle. E. Dordan, white, M. Martha, and Golden Martha. Mr. Bentley and Mr. Mynett were first and second for six singles. Of Mr. Bentley's collection the best were perhaps Miss Cressy, Yellow Purity, Terra Cotta, Lady Churchill, Purity, and Oceana. Quite a feature of the show were the exhibits in the class for twelve vases of chrysanthemums, twelve varieties, three blooms in each, and only chrysanthemum foliage to be used. Mr. Hunt was first, Mr. McLeod second, and Mr. French third.

In the class for four ferns the prize-winners were Mr. Hutton, gardener to G. E. Frere, Esq., The Camels, Wimbledon Park, Mr. Methven, and Mr. Mynett; and for primulas the successful exhibitors were Mr. French, Mr. Mynett, and Mr. Tew. Mr. Mynett and Mr. Tew were first and second respectively for table plants, whilst for berried plants the awards were made in favour of Mr. Taylor, Mr. French, and Mr. Mynett.

FRUIT AND VEGETABLES.—There were five entries in the class for black grapes, the successful exhibitors being Mr. Bentley, Mr. Methven, and Mr. Taylor; whilst for white grapes Mr. Methven, Mr. Hutton, and Mr. Bentley were the prize-winners. Mr. Taylor, Mr. Tew, and Mr. Methven were first, second, and third for dessert apples, for kitchen apples, and for pears. For the best collection of vegetables the awards went to Mr. Hutton and Mr. Bentley, whilst for six varieties of vegetables the order of positions of the two was reversed.

Special mention must be made of the fine group of miscellaneous plants and flowers occupying the whole of the lower end of the hall and staged by Messrs. Veitch and Sons, Chelsea.

FINCHLEY CHRYSANTHEMUM SOCIETY, November 3 and 4.

THE above society held its thirteenth annual exhibition in the New Lecture Hall, East Finchley, on the above dates, and fully maintained the high reputation this society has enjoyed. Perhaps the exhibits were scarcely so numerous as usual, but on the other hand the quality of the cut blooms was very fine indeed, an improvement which it is very pleasing to note, seeing that so often excellence of culture appears to be ranked below plenitude of exhibits.

CUT BLOOMS were fairly numerously staged and of excellent quality, the Japanese being on the whole superior to the incurved. In the class for twelve Japanese and twelve incurved distinct there were four exhibits, the premier award going to Mr. H. A. Page, gardener to Mrs. P. Twells, Chase Side House, Enfield. His best Japanese were Australie, Robert Cannell, Edwin Molyneux, Pride of Madford, Colonel W. B. Smith, Mutual Friend, Thomas Wilkins, and Mrs. Weeks, whilst of his incurved the pick were Queen of England, Violet Tomlin, Baron Hirsch, Globe d'Or, Madame Darrier, and C. H. Curtis. The second prize went to Mr. J. Sandford, gardener to G. W. Wright-Inglis, Esq., North Finchley, and the third to Mr. S. Foster, gardener to R. Nivison, Esq., Hendon. For twenty-four Japanese Mr. J. Brookes, gardener to W. J. Newman, Esq., Totteridge, secured the premier award. In his stand were to be seen fine blooms of Australie, J. Seward, Mons. G. Henry, W. G. Nevill, J. Bidencope, E. Tabor, Mons. C. de Leche, Oceana, Angleterre, M. E. Rosette, Phœbus, Pride of Madford, B. Nowell, and Marie Hoste. In the class for six blooms of Mutual Friend the competition was keen, and of the six exhibitors Mr. F. Read, gardener to G. J. Morris, Esq., Hendon, was adjudged first, Mr. Brookes second, and Mr. Page third. Mr. Brookes was, however, first for six yellow Japanese with fine blooms of Phœbus. The other awards went to Mr. A. Page and Mr. Foster. For three pairs of incurved the premier award was made in favour of Mr. Page, who staged fine blooms of Globe d'Or, C. H. Curtis, and Brookleigh Gem. Mr. C. Bradley, gardener to G. Watson, Esq., North Finchley, was second, and Mr. Cook third. Mr. Brookes's splendid blooms of Marie Hoste placed him first in the class for six Japanese of one variety, Mr. Sandford being second, and Mr. H. Tilbury, gardener to C. E. B. Young, Esq., Southgate, third. Mr. Brookes was also first for twelve Japanese distinct, staging good examples of M. E. Rosette, R. Powell, Oceana, Angleterre, E. Tabor, Pride of Madford, Modesto, Lady Hanham, C. de Leche, Phœbus, Marie Hoste, and Mrs. W. H. Lees. The other awards went to Mr. Sandford and Mr. Tilbury. In the class for six incurved and six Japanese distinct Mr. G. Partridge, gardener to T. R. Whiteley, Esq., East Finchley, was adjudged first. His incurved were nice blooms of D. B. Crane, Baron Hirsch, C. H. Curtis, Mons. R. Bahaunt, Madame Darrier, and Brookleigh Gem, whilst the Japanese he staged were Mutual Friend, Edith Tabor, Pride of Madford, Mrs. H. Weeks, Lady Byron, and Viviand Morel. Mr. Martin, gardener to Mrs. Langton, Hendon, was second, and Mr. G. Spacey, gardener to H. Ward, Esq., Finchley, third. There were five entries in the class for six Japanese one variety, Mr. F. Read being first with good examples of Mrs. C. H. Payne, the other awards going to Mr. Martin and Mr. C. J. Webber, gardener to F. Abethell, Esq., Muswell Hill. For twelve Japanese distinct Mr. Martin was, however, first with nice specimens of Australie, Phœbus, Edith Tabor, Mrs. C. Teichmann, Eva Knowles, Chenon de Leche, Simplicity, Pride of Madford, Lady Ridgeway, James Bidencope, Mdlle. Thérèse Rey, and Dorothy Seward; Mr. Partridge was second, and Mr. Spacey, gardener to H. Ward, Esq., Finchley, third. Mr. Wright secured the principal award for six white Japanese with excellent blooms of Madame Carnot, the other prizes going to Mr. A. L. Bongard and Mr. W. Timewell.

For six Japanese distinct Mr. Timewell was, however, first, with Mr. Wright and Mr. Bongard second and third. Mr. Partridge, Mr. Bradley, and Mr. Cook were in the order named the successful exhibitors in the class for six incurved. For six Japanese distinct the prizes went to Mr. Read, Mr. Partridge, and Mr. Spacey. On Mr. Read's stand were fine blooms of Mrs. C. H. Payne, Phœbus, Madame Carnot, Charles Davis, Viviand Morel, and Mdlle. Gilbert. Mr. Martin secured the premier award for six incurved distinct, staging excellent examples of James Murray, Duchess of Fife, Baron Hirsch, Globe d'Or, Jeanne d'Arc, and Madame Darrier; Mr. Spacey was second, with Mr. Partridge third. Mr. Wright was first for twelve Japanese distinct, his best blooms being M. Gruyer, Dorothy Shea, Pride of Madford, Phœbus, Duke of York, Chenon de Leche, G. C. Schwabe, Charles Davis, and Mdlle. Thérèse Rey. The other awards were in favour of Mr. Bongard and Mr. Timewell. For three pairs of Japanese the prizes went to Mr. Wright, Mr. Russell, and Mr. James, whilst for six yellow Japanese Mr. Wright, Mr. Bongard, and Mr. Timewell were the successful exhibitors. Mr. Tilbury secured the award for twelve incurved distinct, his best blooms being C. H. Curtis, Duchess of Fife, Lord Wolseley, A. Lyne, Jardin des Plantes, and Brookleigh Gem. A fine exhibit by Mr. Page secured him the award in the class for twelve bunches of chrysanthemums with foliage. Mr. J. Maule, gardener to H. T. Matthews, Esq., Hadley, was first for twelve reflexed, noticeable on his stand being good blooms of Distinction, Golden Christine, Jelli, Elsie, King of Crimsons, Chevalier Domage, and Pink Christine; Mr. Page was second. Mr. Maule and Mr. Page were also first and second respectively for twenty-four large-flowered anemones, Mr. Maule's best blooms being Grand Alveole, Dawson, Thorpe Junior, Dame Blanche, Mrs. W. Gardner, and Jeanne Marty. For twelve large-flowered anemones Mr. Sandford was first, with good specimens of Delaware Junior, Gluck, Sequisition, Madame Lawton, Descartes, Delaware, and Minnie Chate; Mr. Maule and Mr. Page were second and third. Mr. Wright secured the premier award for six pompons, distinct, his best blooms being Fremy, Charles Dickens, Touissant, Morizel, White Madame Martha, Rubra Perfecta, and Golden Madame Martha. The other prizes went to Mr. Timewell and Mr. Taylor. For twelve bunches of pompons, distinct, Mr. Page was adjudged the most successful exhibitor, and on his stand were to be seen fine examples of Bessie Flight, B. M. Hart, Edith Rowbottom, Black Douglas, Maid of Kent, West Lake, and Adonis. The other awards went to Mr. Spacey and Mr. Cook. A fine stand of single chrysanthemums secured Mr. Speller, gardener to W. B. Tubbs, Esq., Finchley, the first prize, his best blooms being Rose Pink, Lady Churchill, Miss A. Holden, Yellow Jane, Miss Mary Anderson, Lizzie Mainwaring, Earlswood, Terra Cotta, Emily Wells, and Buttercup; Mr. Page was second.

GROUPS AND SPECIMEN PLANTS were not numerous; Mr. G. Neal, gardener to H. C. Stephens, Esq., M.P., Finchley, was first for a group of fifty square feet, with Mr. Foster second. Mr. Brookes was first for three trained Japanese plants, and also for a single trained specimen Japanese. In the latter class Mr. Tilbury was second. Mr. Brookes and Mr. Tilbury were also first and second respectively for single specimen incurved. For six table plants the prizes went to Mr. Read, Mr. Martin, and Mr. Webber.

FRUIT AND VEGETABLES were of excellent quality and fairly numerously staged. For three bunches of white grapes Mr. Sandford, Mr. Spelter, and Mr. Bradley were the successful exhibitors in the order named, whilst for black grapes Mr. Sandford and Mr. Page were first and second. Mr. Tilbury, Mr. Spacey, and Mr. Bradley were successful for three dishes of dessert apples; whilst for kitchen apples Mr. Neal was first, Mr. Tilbury second, and Mr. Bradley third. For a collection of vegetables the awards were in favour of Mr. Cook, Mr Low, and Mr. Page, in the order named.

A very fine feature of the show were the fine groups exhibited (not for competition) by Messrs. Cutbush and Messrs. B. S. Williams and Son.

PORTSMOUTH, November 2 and 3.

THE Portsmouth Chrysanthemum Society was this year fortunate in securing the Town Hall wherein to hold its twelfth annual show, which proved to be one of the best held under the new *régime*. The plants and groups were arranged around the sides of the hall under the galleries, the cut blooms, fruit, and vegetables occupied a prominent position on tables down the body of the hall. The arrangements were quite of the best in the hands of the hon. secretary, Mr. W. H. Berry.

CUT BLOOMS received the most encouragement and made a good display; the quality throughout was well up to the average. The principal class was that for forty-eight in thirty-six varieties, half to be incurved and the remainder Japanese. Four competed, making an attractive display. Mr. C. Penford, gardener to Sir F. Fitzwygram, Bart., Leigh Park, Havant, succeeded in winning the premier award by the fine quality of his Japanese blooms, which were heavy, brightly coloured, and well staged. The varieties were: Australie (two), Eva Knowles, Ella Curtis (two), M. Gustave Henry, Mrs. W. H. Lees, Mrs. C. H. Payne, Pride of Exmouth (two), very fine, Edith Tabor, Pride of Madford (two), Mrs. G. Carpenter, Modesto, Chenon de Leche, Viviand Morel, Primrose League, R. Powell, Mdlle. M. A. de Galbert, Colonel W. B. Smith, Lady Hanham, Phœbus, and E. Molyneux. Incurved were rather uneven. The varieties were: Lady Isabel, Lord Wolseley (two), C. H. Curtis (two), Duchess of Fife (two), Austin Cannell, Miss A. Haggas, D. Foster, Madame Darrier (two), Mrs. R. C. Kingston, Princess of Wales (two), Brookleigh Gem, Jeanne d'Arc, G. Haigh, R. Petfield, V. Foster, Mrs. S. Coleman, Lucy Kendall, Violet Tomlin, and Triomphe d'Eve. Mr. W. G. Adams, Clarendon Road, Southsea, was a good second. The incurved blooms here were much superior, but he lost much ground on the Japanese. Especially good was Princess of Wales, Duchess of Fife, and Mrs. N. Molyneux. Mr. F. G. Foster, Brockhampton Nurseries, Havant, was a good third. The class for twenty-four Japanese produced good competition, and as the exhibits were all of high class an attractive show was made. Mr. J. Agate, the Nurseries, Havant, easily beat Mr. Penford for premier place with a grand lot of blooms. Lady Byron, Australie, Mrs. W. Mease, Mdme. Carnot, President Nonin, Oceana, Milano, Mons. Hoste, M. de a Rocheterie, Simplicity, Australian Gold, Mrs. W. Popham, Lady Hanham, and Mdme. Philip Rivoire were the most noteworthy; Mr. Penford second, and Mr. Woodfine, gardener to Major Boyd, Emsworth House, third. Mr. Penford easily secured the leading award for twenty-four incurved with a fairly good stand of blooms. Princess of Wales, Jeanne d'Arc, Duchess of Fife, and Mdme. Darrier were the best. Mr. C. White second, and Mr. F. R. Williams third.

Amateurs staged strongly, the best twelve Japanese coming from Mr. White, Southsea, Mr. Courtnell and Mr. H. H. Lees, Cedar Road, Southampton, following in the order named. Numerous classes were provided for growers in Portsea Island only, and produced a full entry and good quality blooms. Mr. C. White secured the leading award for twenty-four Japanese, Mr. Adams occupying a similar position for twenty-four incurved, both staged creditably.

Much interest was centred in the table decoration, bouquet, and epergne classes, Miss Turner winning first prize in the first named with a pleasing arrangement. Messrs. W. Turner and Sons won for a bouquet of chrysanthemums, a similar honour falling to Mrs. E. H. Marshall, Southsea, for an elegantly decorated epergne.

For a group of chrysanthemums interspersed with foliage plants there were six entries. Mr. J. Agate was distinctly first with an arrangement that left little to be desired; Mr. Foster second. Mr. Bevans, Landport, staged the best six plants, freely flowered and not too formally trained. The same exhibitor won also for one specimen. Mr. J. Nance, Buckland, secured a like award in the amateurs' section.

Fruit and vegetables were numerous and good in quality. Mr. W. Cheator won for black grapes and two collections of vegetables, staging really good exhibits. Mr. Penford had the best white grapes, creditable examples of Muscat of Alexandria. First-class certificates were awarded to Mr. W. Wells, Earlswood Nurseries, for chrysanthemums Lord Ludlow, Miss Nellie Pockett, and Mrs. White Popham, all belonging to the Japanese section; to Mr. N. Molyneux, Rookesbury Park, Fareham, for chrysanthemum Jane Molyneux, creamy white Japanese; and to John Miles, incurved of much promise. Two certificates from the N.C.S. were awarded, one to Mr. Penford for his forty-eight chrysanthemum blooms, and the other to Mr. G. W. Adams for his exhibit of incurved blooms.

PLYMOUTH, November 3 and 4.

THE seventh annual exhibition of the West of England Chrysanthemum Society was held in the Guildhall, and was much the best of the series yet held. Spacious as is this splendid municipal building, additional space had to be provided by erecting a marquee near to the entrance of the hall. This contained many of the plants and all the vegetables, the latter being especially numerous, owing, no doubt, to the extra encouragement offered to exhibitors by the special prizes given in this section by Mr. R Sydenham, Birmingham. The arrangements necessary for such a vast show were as usual in the capable hands of Mr. Charles Wilson, the energetic honorary secretary, and were, as might be expected, efficiently carried out. The most interest centred in the cut blooms, of which there was a large display.

The principal class was for forty-eight Japanese, in not less than twenty-four varieties, and as there were six competitors it proved an interesting as well as good display. The first prize of £10 was somewhat easily won by Mr. G. W. Drake, The Cathayes Nurseries, Cardiff, with a magnificent set of large yet full quality specimens, beautifully staged. The varieties were Lady Hanham, Mrs. J. Lewis, grand, Mrs. G. W. Palmer, Madame Carnot, E. Molyneux, James Bidencope, Lady Ridgeway, Australie, Edith Tabor, full; Pride of Exmouth, Mutual Friend, Mons. Gruyer, Mons. Chenon de Leche, rich colour; Thos. Wilkins, Viviand Morel, Robert Powell, Mrs. C. H. Payne, Ella Curtis, Pride of Madford, especially deep in colour; Mrs. W. H. Lees, G. C. Schwabe, M. Gustave Henry, Elthorne Beauty, Mrs. G. Carpenter, Dorothy Seward, M. G. Bruant, Mrs. H. Weekes, Joseph Brooks, and Simplicity. Mr. G. Foster, gardener to H. Hammond Spencer, Glendanah, Teignmouth, was a good second; while Mr. W. H. Fowler, Claremont, Taunton, was an exceedingly close third. For twenty-four Japanese, in not less than eighteen varieties, there was also brisk competition. Mr. G. Stiles, gardener to the Rev. G. Lyon, Teignmouth, was a creditable first-prize taker with a stand of heavy, well-coloured blooms; Mons. Hoste, Lady Hanham, Milano, and Baron Adolph Rothschild were noteworthy. Mr. Foster was second, and Mr. Fowler third. In the class for twelve Japanese Mr. G. H. Paddon, gardener to H. Leah, Esq., Treverven, was the most successful, staging the following varieties in splendid condition: Phœbus, M. Chenon de Leche, Australian Gold, Magnificent, M. Hoste, Oceana, Reine d'Angleterre, and Viviand Morel; Mr. Stiles second. A class was provided for six incurved Japanese, but in which there were but two competitors. Mr. Paddon staged creditable examples of Australie and Oceana, and secured the leading award; Mr. Foster second. With grand examples of Souvenir de Petite Ami, Mr. Farmer, gardener to the Misses Carew, Buckfastleigh, won the first prize for six white; Mr. Foster second. For six of any colour, except white, there was spirited competition and a choice lot of blooms. Mr. Paddon won with fully-developed specimens of Australian Gold; Mr. Stiles followed closely with richly-coloured Phœbus; very fine Australie securing for Mr. Foster the remaining award. As compared with the Japanese the incurved section was poorly represented. For twenty-four Mr. J. Wilkins, gardener to Lady Theodora Guest, Inwood House, Blandford, won first place with blooms of varieties naturally possessing a rough exterior; Mr. Foster was second, with much smaller yet superior examples, showing the Chinese section much more truthfully. These two exhibitors reversed their position for twelve incurved, the winning stand containing many creditable examples. Anemone-flowered varieties were fairly well represented, but in the baskets of chrysanthemums the blooms were of inferior quality.

Good prizes were offered for the best floral display occupying a space six feet by five feet, and as this class had a prominent position assigned it in the centre of the hall it was a great attraction. Messrs. Perkins, Coventry, were easy first prize winners with one of their characteristic exhibits; Mr. J. Arnold, Stoke, was second; Mr. J. Tomlinson, Devonport, third, both staging creditably.

Groups of chrysanthemums, interspersed with foliage plants, occupying one hundred square feet, made a bold display at the sides of the hall. Mr. J. Webber, Plymouth, secured the leading award with a somewhat stiff arrangement of plants carrying good blooms; Lady Jackson, Pounds, Plymouth, second. Mr. F. Hodges, Plymouth, arranged an interesting group of orchids in front of the orchestra, which was much admired. Plants were numerously staged, adding much to the general appearance of the hall. Fruit was a feature, and so were the vegetables. Limit of space, however, forbids further notice.

SCOTTISH HORTICULTURAL ASSOCIATION.

AMONG the exhibits at the recent meeting of this body were fine centre pieces of chrysanthemums with grass and asparagus, prominent among which were Globe d'Or, Viviand Morel, W. H. Lincoln, Miss Watson, Source d'Or, &c.; the president also showed a charming glassful of General Jacqueminot rosebuds as fresh as if gathered in June.

Messrs. Greene and Sons showed a promising seedling chrysanthemum, the Portsman; Mr. Chaplin, St. Leonards, Edinburgh, a very charming trained and perfectly bloomed plant of Begonia Gloire de Lorraine; Mr. Little, Largin Castle, a nice collection of hydrangeas with bluish blooms from the open air. Mr. McMillan, of Trinity Cottages, sent some half dozen of the pretty dwarf magenta chrysanthemum, Madame Marie Masse, a most profuse bloomer, about a foot high. Mr. Dalgleish sent a remarkably delicate seedling tuberous-rooted begonia of great promise, of full size and delicate colours.

The lecture on this occasion was given by Mr. D. McDonald, who discoursed upon the "Chrysanthemum for Cut Flowers and Conservatory Decoration." Mr. McDonald dealt with the subject in a most practical and yet attractive manner, and the large audience accorded him a hearty vote of thanks.

ROYAL HORTICULTURAL SOCIETY, November 8.

THERE was but a small exhibition at the Drill Hall on the above date, and also a small attendance, owing to the counter-attraction provided by the National Chrysanthemum Society.

FLORAL COMMITTEE.

A splendid group of fifty species and varieties of polypodiums was put up, in addition to fine examples of Begonia Gloire de Lorraine, by Mr. H. B. May, Dyson's Lane Nurseries, Edmonton; and a nice collection of dahlias, principally pompons and cactus, was contributed by Messrs. T. S. Ware and Co. (Limited), Tottenham. Messrs. Sander and Co., St. Albans, sent some fine plants of Dracæna Sanderiana and Acalypha Sanderi; and begonias, Myra and Mrs. Heal, came from Messrs. J. Veitch and Sons (Limited), Chelsea. About a hundred blooms of Japanese and Japanese incurved blooms were staged by Mr. W. Wells, Earlswood, Redhill. Some of the finest were Mr. T. Carrington, Mrs. Mease, G. J. Warren, and John Pockett, Lord Ludlow, Mrs. White Popham, and a new bright yellow hairy variety, named Leocadia Gentil, a sport from white Louis Bœhmer. Mr. W. J. Godfrey, Exmouth, put up some fine chrysanthemums, including King of the Yellows, Dome d'Or, incurved varieties; and Mr. T. Carrington, Mrs. J. G. Glenner, Lord Boston, Pres. Bevan, Marie Calvat, Le Grand Dragon, and Autumn Glory, all Japanese varieties of great beauty.

The Chelsea firm of Messrs. J. Veitch and Sons showed some handsome perennial asters, such as A. grandiflora, A. Tradescanti, and A. Drummondi Sappho. Messrs. F. Sander and Co., St. Albans, put up a splendid lot of plants of the showy Acalypha Sanderi, and A. Godseffiana.

ORCHID COMMITTEE.

Mr. G. Day, gardener to H. T. Simmonds, Esq., Woodthorpe, Beckenham, sent a pretty little collection of orchids, Odontoglossum grande and Oncidium vancosum being especially good. Mr. Smith, orchid grower to the Right Hon. J. Chamberlain, M.P., Highbury, Birmingham, showed a few good orchids, including Lælio cattleya Semiramis, Cattleya T. Austin, and C. Mrs. Edicott. Messrs. J. Veitch and Sons, Chelsea, contributed a good display of orchids, including many most interesting plants, such as Cypripedium Lawrenceanum and Leanum, Miltonia Bleuana with seven beautiful flowers, Cypripedium insigne Sanderæ, C. œnanthum superbum, and Cattleya Dowiana.

FRUIT COMMITTEE.

A representative collection of about a hundred varieties of dessert apples was staged by Messrs. Bunyard and Co., Maidstone.

MEDALS.

A gold medal was awarded to Messrs. G. Bunyard and Co. for a collection of hardy fruit; and one to Messrs. J. Veitch and Sons, Chelsea, for orchids; Silver-Gilt Banksian medal to H. J. Elwes, Esq., F.R.S., for a group of hybrid nerines; Silver-Gilt Flora medal to Mr. H. B. May, Edmonton, for a group of polypodiums; Silver Flora medal to Messrs. T. S. Ware and Co. (Limited), Tottenham, for chrysanthemums; and to Mr. W. Wells, Earlswood, for chrysanthemums; Silver Banksian medal to the Right Hon. J. Chamberlain, Birmingham, for orchids; to H. Simmonds, Esq., Beckenham, and to Mr. J. Bradshaw, Southgate, for orchids. A Bronze medal was awarded to Mr. J. Douglas, Bookham.

SEVENOAKS AND WEST KENT CHRYSANTHEMUM SOCIETY,

November 1 and 2.

THE fourteenth annual exhibition of the above society was held on the above dates, and proved that this district is well to the front in the art of successfully cultivating the greatest of our autumn flowers.

GROUPS AND SPECIMEN PLANTS, always a feature of this show, were not quite so numerous as usual, but this falling off was more than balanced by the excellence of culture displayed. The competition in the big class for a group of chrysanthemums arranged for effect—for which a twenty guinea cup was offered as the premier award—was extremely keen, the first prize being awarded to Mr. A. Hatton, gardener to Mrs. Swanzy, The Quarry, Sevenoaks, for an excellent group of fine flowers. Mr. Hatton having previously won this cup on two occasions it now becomes his property. Mr. Tebay, gardener to Mrs. Rycroft, Everlands, Sevenoaks, was second, and Mr. W. Adams, gardener to Mr. J. Dixon, Edenhurst, was third. For three high-trained plants the awards were made in favour of Mr. A. Hoadley, gardener to Mr. F. L Bevan, Kippington; Mr. Brooker gardener to J. T. Rogers, Esq., Riverhill; and Mr. Hatton; whilst for a single bush-trained plant Mr. Hoadley was first, Mr. Hatton second, and Mr. Brooker, third. Mr. Huntley secured the award for three incurved, and Mr. Heath for three Japanese. Mr. Heath was also first for a group of plants not to exceed a space six feet by five feet. Mr. Huntley secured the premier award both for three pompons and for a single bush-trained plant, whilst in the latter class Mr. Heath was second. A good feature of the show was the class for twelve cut blooms with long stems arranged with foliage and plants; the competition was severe, Mr. Tebay securing the first prize with an extremely tasteful arrangement, his flowers being also very fine indeed. Mr. J. R. Edwards, gardener to Mr. G. Field, Beechy Lees, was second, and Mr. Hoadley third.

CUT FLOWERS.—For six Japanese, one variety, the awards were in favour of Mr. W. Hough, gardener to Mrs. Lambarde, Beechmont; Mr. W. A. Searing, Parkwood, Swanley; and Mr. L. Taylor, gardener to Mr. C. Young, The Thorns, Sevenoaks, in the order named. Mr. Tebay was first for twelve Japanese distinct, with Mr. Searing second, and Mr. G. Latter, gardener to Mr. Payne, Park Grange, Sevenoaks, third; whilst for twelve Japanese, not less than eight varieties, Mr. Adams, Mr. Hough, and Mr. Hoadley were the prize-winners. Mr. Tebay secured the award in the class for twelve incurved, distinct, but for twelve incurved, not less than eight varieties, the awards were in favour of Mr. W. Hough, Mr. Brooker, and Mr. Latter in the order named. A good stand of anemones secured Mr. Hoadley the post of honour in that class, Mr. Taylor and Mr. Adams being second and third. For six incurved, not less than four varieties, the prize-winners were Mr. Fox, Mr. Heath, and Mr. Huntley.

FRUIT AND VEGETABLES were a great feature of the show, as is always the case here. They were both numerously staged and of good quality. For two bunches of black grapes Mr. Hough secured the premier award, the other prizes going to Mr. Hoadley, Mr. Potter, and Mr. Latter in the order named. Mr. Potter was, however, first for four dishes of kitchen apples, with Mr. R. Edwards second, and Mr. George Sears, Clenches Farm, Kippington, third. The latter exhibitor secured the premier award for four dishes of dessert apples, the other prizes going to Mr. Searing and Mr. Edwards. For four dishes of pears the awards were in favour of Mr. Edwards, Mr. Potter, and Mr. Latter. Mr. E. Dawes, gardener to Mr. Wilson, Claridge House, Sevenoaks, was first for two dishes of kitchen and two dishes of dessert apples, Mr. S. Huntley, gardener to the Rev. T. S. Curleis, second, and Mr. Heath, gardener to Mrs. Petley, Riverhead, third. There were no less than three classes for six varieties of vegetables; in the first the prizes were secured by Mr. Hoadley, Mr. Tebay, Mr. Searing, and

Mr. Adams; in the second the awards fell to Mr. Huntley, Mr. W. Fox, gardener to Mr. H. Sowerby, and Mr. E. Turner, gardener to the Rev. H. P. Thompson, Kippington Vicarage; whilst in the third award was made in favour of Mr. Heath.

COLCHESTER HORTICULTURAL SOCIETY, November 3.

THE autumn exhibition of this enterprising society, held on the above date, was a splendid success, and reflected much credit upon all concerned. The spacious Corn Exchange was, as in previous years, crowded with products of a high order of merit, and these produced a highly attractive display, and were of much interest as illustrating the horticultural activity of the district, of which Colchester is the centre. In consequence of the unfavourable character of the season there was a slight falling off in the entries of chrysanthemums, but the decrease was wholly in the smaller classes, and the display of cut blooms was not less attractive than were those in previous years. The groups of chrysanthemums were of a higher quality than in any previous year, and arranged along one side and across the end of the spacious building they formed an exceedingly beautiful feature. In the division for fruit there was a material advance not only in entries, of which there were seventy more than last year, but in the quality, which was so good as to prove to demonstration the capabilities of Essex as a fruit-producing county. Altogether there were about five hundred dishes of fruit, and of vegetables there was an excellent display.

CUT BLOOMS were admirably represented, and, as is customary, proved a source of much attraction. There was a keen contest for first place in the class for twenty-four Japanese, and in the result the premier award was made in favour of Mr. B. Rogers, gardener to the Mayor of Colchester, who had a remarkably fine stand, comprising in a high state of development Australian Gold, Edith Tabor, Pride of Exmouth, Queen of the Buffs, Mrs. H. Weeks, Oceana, Phœbus, N.C.S. Jubilee, and Modesto; Mr. R. C. Notcutt was second, with an even stand, in which were exceptionally fine blooms of President Nonin, Edith Tabor, and Mrs. W. Mease, the beautiful primrose sport from Madame Carnot. Mr. Rogers obtained premier honours also in the open class for twelve Japanese, and had superbly developed blooms, comprising Duke of Wellington, which was selected as the premier bloom in the exhibition, Phœbus, Lady Hanham, Viviand Morel, Edith Tabor, Lady Byron, Colonel C. B. Smith, N.C.S. Jubilee; Mr. F. Kettle, gardener to G. Egerton Green, Esq., was a capital second, with a stand in which Lady Hanham was especially well represented; Mr. W. R. Johnson, Stainwall Hall, was third, with neat blooms. In a second class for twelve Japanese Mr. Rogers was again first, and Mr. F. Kettle second, both having excellent blooms, especially noteworthy in the first prize stand being examples of Phœbus, Eda Prass, T. Wilkins, and Lady Hanham. Mr. Rogers was not less successful as an exhibitor of blooms of incurved varieties, and was first for twelve, staging finely-developed examples of Globe d'Or, Duchess of Fife, Triomphe d'Eve, C. H. Curtis, and J. Agate; Mr. Kettle second. Mr. Fincham was third, with neat blooms, from which was selected Globe d'Or as the premier incurved bloom shown by residents in the borough. The last-named exhibitor had the finest stand of twelve Japanese, in which the competition was limited to growers residing within the borough, and for this he was awarded the Borough Cup, offered as the first prize, the N.C.S. silver medal for the best stand of twelve blooms grown in the borough, and the N.C.S. certificate for the premier Japanese bloom in the borough section.

GROUPS constituted a highly attractive feature, and in the principal class set apart for them there were six entries, all of which were more or less good. Mr. Norfolk, gardener to S. Hanbury, Esq., Wyvenhoe Park, was first with a superb arrangement, the foliage ample, the blooms of magnificent quality, and the colours tastefully contrasted; Mr. F. Kettle was second with a bold and effective group; and Mr. W. Diaper was third with an arrangement a trifle flat, but in other respects satisfactory. In the class for small groups the awards were made in favour of Mr. Allchurch, Wyvenhoe, Mr. H. Johnson, and Mr. T. Ham, all of whom may be congratulated on the excellence of their exhibits. In the classes for specimen plants the most successful exhibitors were Mr. C. Munson, Mr. F. Kettle, Mr. Allchurch, Mr. J. Levet, and Dr. F. H. Cooke.

FRUIT was so plentiful and well staged as to form of itself a highly attractive exhibition. In the division for fruits the Rev. Dr. Bartram, Wakes Colne Rectory, was very successful, taking eleven first prizes in the more important classes. In competition for the prize for six dishes of pears this gentleman was first with large, well-finished examples of Emile d'Heyst, Beurré Diel, Beurré Superfin, Doyenne du Comice, Pitmaston Duchess, and Conseiller de la Cour; Mr. F. Kettle was a good second. Mr. Prestney was a capital first in the class for three dishes of dessert pears with Pitmaston Duchess, Beurré Clairgeau, and Beurré Diel; Mr. Woolley a close second. Rev. Dr. Bartram occupied the post of honour in the class for six dishes of culinary apples with grand fruit of Cox's Pomona, Mère de Ménage, Bismarck, Lane's Prince Albert, Bramley's Seedling, and Peasgood's Nonsuch; Mr. F. Kettle and Mr. O. G. Orpen, West Bergholt, were second and third with fruit differing but little in relative merit. The Rev. Dr. Bartram had the best collection of six dishes of dessert apples, the fruit highly coloured and well finished, the varieties including Blenheim Pippin, Ribston Pippin, Cox's Orange, King of the Pippins, and Gascoyne's Scarlet, the last mentioned being rather too large for dessert. Mr. O. G. Orpen was an excellent second, his fruit being good throughout. Mr. Chapman and Mr. Harward were first and second in the class for three dishes of dessert apples with fruit of high quality. Mr. R. W. Wallace, Colchester, was first in the class for one dish of a dessert apple with Allington Pippin, beating Cox's Orange and other of our popular variety; the fruits were rather large, richly coloured, and highly flavoured. Mr. Wallace was also first for twelve fruits of a dessert apple packed for travelling with excellent fruits of this variety; these were packed in a shallow box with wood wool, and might have been sent any distance by post or rail without injury. The premier award for nine dishes of apples, comprising five cooking and four dessert varieties, was made in favour of the Rev. Dr. Bartram, who had superb examples of well-known varieties. The second award was made in favour of Mr O. G Orpen, who had a fine collection.

VEGETABLES had a large number of classes set apart for them, and as these were all well filled they formed an interesting feature. Mr. Kettle was first in the amateur class for eight kinds, Mr D Strowlger occupied the premier position in a similar class for market gardeners, and in the class for amateurs not employing more than one gardener Dr. F. H. Cooke obtained premier honour.

BATTERSEA CHRYSANTHEMUM SOCIETY, November 4 and 5.

THE annual exhibition of the above society was held in the Town Hall, Lavender Hill, on the above dates, and both the quality and number of the exhibits was hardly equal to the shows of previous years.

GROUPS AND SPECIMEN PLANTS.—In the class for a group of chrysanthemums not to exceed thirty super feet Mr. W. Forth was first, and Mr. W. Riddle second; whilst for a group not exceeding twenty-four plants the prizes went to Mr. C. Hemstead, Mr. J. Kimber, and Mr. Stringer in the order named. Mr. Green, Mr. Duke, and Mr. Awberry were the successful exhibitors in the class for three pompons; and Mr. Langrish, Mr. Hart, and Mr. Hemstead were first, second, and third respectively for three ferns. For three foliage plants the awards went to Mr. Eason, Mr. Hemstead, and Mr. Awberry; and for three table plants the awards were made in favour of Mr. Hart, Mr. Hemstead, and Mr. Awberry. Three very good entries were staged in the miscellaneous group class, the first prize going to Mr. T. MacGregor, The Gardens, Keith House, Putney Hill; the second to Mr. W. Boswell, gardener to P. Parnell, Esq., Woodlands, Streatham Hill; and the third to Mr. A. J. Povey, gardener to W. Mayne, Esq., The Field, Larkhall Lane, S.W. Perhaps the most spirited competition in the show was evoked in the class for a table group of plants and cut blooms, and of the five competitors the most successful exhibitor was Mr. Hart, with a very tasteful arrangement; the second prize went to Mr. Bond, and the third to Mr. Awberry.

CUT BLOOMS.—It was in this section that the show was weakest and where the greatest falling off was to be observed, and it is to be hoped that next year there will be an improvement in these classes, particularly with regard to the number of entries. For eighteen Japanese Mr. Povey secured the award, the most noticeable blooms on his stand being Mrs. Hume Long, G, J. Warren, Madame Carnot, Eva Knowles, Charles Davis, Australie, Mons. Chenon de Leche, Australian Gold, Graphic, Mons. Gruyer, Mdlle. Thérèse Rey, Pride of Exmouth, and Mrs. Herman Kliss. He was also first for twelve Japanese, staging fine examples of G. J. Warren, Lady Ridgeway, Madame Carnot, Australie, Mons. Chenon de Leche, Australian Gold, Mrs. J. Lewis, Pride of Madford, Mrs. G. Carpenter, Mrs. Hume Long, Eva Knowles, and Mrs. H. Weeks. Mr. MacGregor was second. Mr. Povey was also successful for six Japanese distinct, his blooms being Madame Carnot, Mons. Gruyer, Elsie Teichmann, Graphic, Viviand Morel, and Pride of Madford. Mr. MacGregor secured the award for six incurved, being best with examples of Globe d'Or, Madame Darrier, C. H. Curtis, and Baron Hirsch. Mr. G. L. Innes was first for twelve Japanese, and on his stand were nice blooms of Chenon de Leche, Madame Ricoud, Van der Heede, Edith Tabor, Oceana, Viviand Morel, Modesto, and Elthorne Beauty. Mr. Bond was second and Mr. White third. For six Japanese, distinct, Mr. Underwood was the successful exhibitor with good blooms of W. H. Lincoln, Viviand Morel, Chenon de Leche, Phœbus, Pride of Madford, and Charles Davis. Mr. Underwood, Mr. Langrish, and Mr. Bond were successful in the order named for six Japanese, whilst for six Japanese one variety Mr. Hemstead and Mr. White secured the awards. For six Japanese, white, Mr. Langrish was first, Mr. Innes second, and Mr. White third. Mr. Bond secured the award in the class for six incurved, not less than four varieties, his blooms being Miss A. Foster, Ma Perfection, Guernsey Nugget, C. H. Curtis, J. Agate, and Duchess of Fife. For six bunches of pompons Mr. Stewart was first with examples of Madame Martha (twice), Nellie Romford, La Vogue, W. Westlake, and W. Kennedy. Mr. Green and Mr. Bond were second and third respectively. Mr. McLellen was first for six Japanese, with good blooms of W. Tricker, Mrs. E. G. Hill, Charles Davis, Souvenir de Petite Amie, and Viviand Morel The other prizes went to Mr. Brill and Mr. Duke.

A good group of plants and flowers was exhibited by Mr. Neal, Wandsworth Common, whilst an effective display of cut flowers was staged by Mr. W. Wells, Earlswood, Redhill. Mr. Box, of West Wickham, contributed a capital exhibit of fruit and begonias.

WOOLTON GARDENERS' SOCIETY, November 3.

A MOST successful meeting of this society was held on the 3rd inst, under the presidency of Mr. B. Cromwell, who, in introducing the lecturer, Mr. B. Ashton, gardener to the Earl of Lathom, referred to the high order and artistic tastes that were followed at Lathom Hall in the "Art of Dinner Table Decorations," the subject of the lecture. Further reference was made as to the importance of a good knowledge of decorating, which was now considered one of the leading traits in good gardening. Mr. Ashton, in opening his lecture, dwelt upon the paramount importance of gardeners having a thorough grasp of this subject, and he urged upon all young gardeners that they should endeavour to make themselves proficient in the art of decoration. Thirty years ago the chief requirements of a gardener were to grow good fruit, plants and vegetables, but the gardener of to-day must be a capable decorator in addition. To obtain a pretty table, elegance, perfume, or colour must be considered or combined. Many flowers could be utilised, such as cdontoglossums, oncidiums, cattleyas, &c, carnations, roses, especially tea varieties, and sweet peas. Cornflowers in the beautiful shades of blue were good for day but not for artificial light, cactus dahlias, Begonia Gloire de Lorraine, montbretias, ixias, sparaxis, Gladiolus Berberis, snowdrops, crocus, and many others Amongst foliage were crotons with their brilliant colouring, abutilons, acers, coleus, azaleas, mollis varieties in autumn, oaks, vine leaves, Virginian creepers, bramble, carrot tops, smilax, rhodochiton, &c. The most desirable plants were a few kinds of palms, aralias, dracænas, pandanus, asparagus, &c., and orchids, fuchsias, celosias for flowering plants, and solanums for berried plants. Plants should be used according to the room. In some cases crotons on single stems five feet high would prove most effective. A good discussion followed, in which it was stated that often common or wild material proved most effective, such as oats and poppies, wild roses, ox-eye daisies, water lilies, buttercups. For garnishing dishes of fruits pear and vine leaves at this season were recommended for their rich colouring.

ST. NEOTS, November 7.

A QUAINT old town is the St. Neots of Huntingdonshire, and one which many visitors journey to with interest in the summer months. It is also the centre of a good horticultural district, and therefore it is not surprising that the society, established some fifteen years ago, has flourished greatly, and still continues to prosper even more than similar bodies in much larger towns. In a great measure, however, this is due to the energy of a guiding spirit in the person of Mr. William Ratchelous, who during the whole of the time has performed the duties of honorary secretary. That he has been well supported by the committee goes without saying, but ample testimony has been afforded by the high esteem in which he is held by the members.

The Corn Exchange was well filled on Monday last, and it was very satisfactory to note that the entries were forty-seven in excess of last year, any deficiencies in a few classes being fully made up by the additional ones in others, especially in the hardy fruit classes, which have developed into a most important department. Possibly the season had some effect upon the cut bloom classes, and perhaps the absence of a challenge vase as a stimulus deterred some from competing, but the money prizes were good, and the blooms staged were of uniformly high quality. The principal class was for thirty-six blooms in equal numbers of Japanese and incurved, not less than twenty-four varieties of the two sections. It was a comparatively easy class, yet there were only two competitors, and Mr. T. Lockie, gardener to A. J. Thornhill, Esq , Diddington Hall, St. Neots, was awarded first prize for excellent blooms, the Japanese being much superior to the others, and including the following varieties particularly well represented: Dorothy Seward, Pride of Exmouth, Madame Carnot, Edith Tabor, Mrs. C. H. Payne, and Beauty of Teignmouth. The leading incurved were Globe d'Or, M. Bahaunt, Duchess of Fife, Prince Alfred, Miss F. Foster, Baron Hirsch, Lord Wolseley, Rose Owen, and J. Agate. The second prize was secured by Mr. J. Walker, gardener to J. Linton, Esq., Stirtloe, St. Neots. In the class for twelve Japanese there were also some good blooms, especially in the first prize stand from Mr. Redman, gardener to Miss Goodjames, St. Neots, which comprised Australie, Eva Knowles, Madame Carnot, M. Chenon de Leche, Mrs. G. W. Palmer, Edith Tabor, Viviand Morel, and Simplicity. The second and third places respectively were taken by Mr. T. Lockie and Mr. J. Walker, who had rather smaller but good blooms.

Mr. Redman was again the premier exhibitor with eighteen incurved and Japanese blooms, followed by Mr. Stevens and Mr. J. Pack, gardener to A C. Sweeting, Esq., St. Neots; while six magnificent blooms of Phœbus won Mr. Thomas, gardener to Lady Esmé Gordon, Paxton Park, the first prize in the class for one variety only. Incurved were shown in small numbers, and the only stand worthy of note was that in the class for twelve blooms, which secured the first prize to Mr. T. Lockie.

Groups of chrysanthemums arranged for effect added materially to the attractions of the show, both plants and blooms being satisfactory in most cases, but uncommonly so in the open class, where Mr. J. Pack was placed first, followed closely by Mr. Redman and Mr. Petchey. Mr. Redman had some well-trained specimen chrysanthemums, which, however, would have improved if the show had been a few days later.

Mr. Maycock, gardener to Madame de Falbe, was adjudged first honours for six table plants, neat, light, and well-coloured examples of crotons and dracænas being prominent. The same exhibitor was also very successful in the fruit classes, taking the first place with a collection of six dishes, his grapes, both black and white, being admirable. Mr. Maycock also won several prizes with apples and pears, Messrs. Redman, Lockie, Walker, Carter, and Thomas competing keenly.

Vegetables were a good feature, Mr. T. Lockie being, as usual, in excellent form, the collection which gained him the first prize comprising extremely handsome Royal Windsor cucumbers, Perfection tomatos, Intermediate carrots, Lyon leeks, Satisfaction potatos, and Anglo-Spanish onions; Messrs. Stevens and Carter were second and third in the order named.

Table decorations included some tasteful effects. Baskets, stands, and vases of chrysanthemums were also numerous, bright, and varied; while a collection of dahlias from Mr. Burgin, of Eynesbury, an unusual exhibit at a November show, added to the attractions of a compact and excellent display.

WEST DERBY MUTUAL IMPROVEMENT SOCIETY.

THE second lecture arranged by the Technical Instruction Committee of the Liverpool City Council was delivered on the 2nd inst., at the Social Club, by W. A. Herdman, Esq., D.Sc., F.R.S., Professor of Zoology in University College, Liverpool, the chair being occupied by Colonel Halifax Wyatt. The course of lectures deals with certain aspects of gardening, and, in addition to the one already mentioned, includes five by R. J. Harvey-Gibson, M.A., F.L.S., Professor of Botany, University College, on "Blight," "The Reserve Food of Plants and its Digestion," "The Colours of Flowers and their Transformation," "Nitrogen, its Source and Use to the Plant," and "Hybrids." The lectures are illustrated by lantern, and by experiments and microscopic or other preparations. The attendance was good, including a fair number of ladies, the subject of Professor Herdman's lecture being "Insect Pests"—their abundance and importance in the world, their forms, with their variety of wings, the effect of seasons and climates, the balance of nature and its disturbance—and under this heading a word of appreciation was given for our sparrows, starlings, tits, cuckoos, &c. Habits and food were also treated upon, with the value of many insects that lived on other insects, lady-birds being of considerable value for this reason. Wire-worm was noticed for its ravages, and to counteract these shallow sowing was recommended for cereals, and preventives were named as the best means of holding the pests at bay. The lectures were illustrated by a number of lantern views, which showed the action and habits of the pests, which were of material aids to the cultivator in enabling him to recognise and destroy the pests.

ISLE OF WIGHT.

THE monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday last, when Dr. J. Groves, B A., presided over a large attendance of members who were present to hear a lecture by Mr. F. W. E. Shrivell, F.L.S., Tonbridge, Kent, on "Four Years' Experiments with and without Chemical Manures." The lecture was most interesting and instructive, and was conveyed to the audience in clear and simple language, which was more forcibly impressed on the minds of those present by the use of tables, &c. A profitable discussion ensued, after which a unanimous vote of thanks was accorded Mr. Shrivell on the proposition of the Chairman, and seconded by Mr. T. Gibbs, C.C., who is an ardent educationalist. Mr. A. Guy staged some well-grown primulas. At the close twenty new members were elected.

WEST COWES.

ON Friday evening last Mr. F. W. E. Shrivell, F.L.S , gave an interesting and profitable lecture before the members of the West Cowes Horticultural Improvement Association. Mr. Benzie briefly introduced the lecturer, who dealt exhaustively with the subject of "Four Years' Experiments with and without Artificial Manures," illustrated by tables, &c. The progress of this society is very gratifying, and bids fair to do a large amount of useful work in the development of horticulture in the town and neighbourhood of Cowes. At the close of the lecture a unanimous vote of thanks was accorded Mr. Shrivell for his able and interesting address on the important subject of manures and manuring.

"CRITICISM WILL FOSTER TALENT," is an adage too well known to need dilating upon, especially as it is necessary to speak of something which for many years has defied adverse criticism. Holloway's Pills and Ointment, as sterling remedies for all complaints, are more familiar than "household words," being in constant daily use by thousands of people, who look upon their possession as a positive necessity. Leading medical authorities advise their use as reliable medicines in times of need. As a certain cure for all skin diseases they are unequalled, whilst for bile, sick headache, flatulency, indigestion, and all liver and stomach disorders, it has been truly said they are worth their weight in gold.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Scions from Old Trees.—F. A. R., Royston: A scion taken from an old tree will prove quite as satisfactory as one from a young tree, provided it is a clean, healthy growth. Thanks for your letter.

Grafting Apples.—F. J., Cork: Head back the trees to the clean, healthy wood and graft next March with Newton Wonder. Do not head back more closely than is necessary, for it will be better to put on additional grafts and thus obtain a crop quickly. The old vine rods can be removed now, covering the cuts with styptic or painter's knotting.

Ashes of Wood and Leaves.—F. N., Bradford: Both wood ashes and the ashes from burned leaves and garden refuse have a high manurial value, and are especially useful for lightly forking into fruit-tree quarters. It is, however, impossible to make a wrong application of such material, and if enough can be spared dig them into plots that are to be presently devoted to vegetable culture. First of all, however, look after the gooseberries and bush roses.

Black Hamburgh Grapes not Colouring.—F. D., Tooting: We can only suggest that the Black Hamburgh grapes did not receive quite those conditions necessary for the production of good colour and finish, viz., more air and a drier atmosphere, at the time they commenced to colour. The grapes would begin to colour while the Alicantes were still green, and probably the conditions best suited to the latter were maintained. There appears to be no other solution of the difficulty. Gros Colmar requires a longer period to ripen and more heat to finish it than either of the other varieties named, and so should not be grown with them. Alicante would do better with Gros Colmar than would Black Hamburgh.

Bast or Raffia.—E. C., Croydon: Bast is the strips of the bast fibres, or inner bark of the Lime Tree, and consequently was formerly known as Linden Bast, the Lime *(Tilia europæa)* being often known as the Linden Tree. This material is now seldom used for tying purposes, having been superseded by raffia. Raffia, rafia, or raphia, is obtained from a Madagascar Palm *(Raphia Ruffia)*, also from *Raphia tædigera*, and is the cuticle stripped from the huge fronds of these giant palms. Some of the palms in our West African dependencies yield a raffia, and probably a considerable industry will arise in this direction; at present Madagascar supplies almost the whole of the raffia of commerce. The old name of "bast" is in some gardens still applied to raffia by old hands.

Propagation of Quince and Myrobella.—J. L. P., Norfolk: The quince is readily propagated, both by cuttings and layers. The former should be made from the current year's growth, and with a heel of old wood attached; they should be taken and inserted in the open early in the autumn, where they root readily. Layering should be done in early autumn, or as soon as the growths are firm enough; the following autumn the layers should be ready for removal from the stock and placed in nursery rows. The Myrobella or Myrobalan *(Prunus cerasifera)* is best propagated from seed, which may be obtained through any nurseryman dealing largely in hardy trees and shrubs for fencing and forestry. The ripe fruits are placed in dry sand, on very light, dry soil in autumn, and the seed cleared out during the winter for sowing in the spring.

United Horticultural Benefit and Provident Society.—S. R., Bedford: This is not a charity, but a benefit society. It was established in 1865, and the rules were drawn up on the lines of the old Wiltshire Friendly Society. Two or three of the original rules have been slightly altered of late years to meet the times, one important alteration being to increase the amount of payment to sick members. There are two scales of contributions, one being 6d. per week and the other 9d. per week, to the sick fund; the lower scale member receives 12s. per week (formerly 10s. 6d.) during sickness, and the higher scale member receives 18s. per week in sickness (formerly 16s.) On the lower scale a member pays 2s. per year, and on the higher 3s. per year to the benevolent fund, and every member pays 2s. 6d. per year for management, the full contributions for the year being £1 10s. 6d. and £2 4s. 6d. respectively. The amount of sick pay paid out is deducted from each member's deposit account proportionately, and the balance of his contributions is carried to his credit, and interest is added at the rate of 3 per cent. on all amounts above £1. There is no fixed sum to be paid at the death of a member, but the amount standing to his credit is paid to his nominee. If a member ceases to pay his contributions for twelve months he is considered to have left the society, and the amount of his deposit is transferred to the lapsed members' account, and the interest on this money is transferred to the management fund. One very important point in this society is that a lapsed member does not lose the money he has paid (as in other societies), but he can draw the amount on reaching the age of sixty, or should he die the sum standing to his credit at the time he ceased to pay would be paid to his nominee on application to the committee. When a member reaches seventy years of age he ceases to pay into the sick fund, and may draw the amount standing to his credit in the ledger, or he may leave the capital and draw upon it as he pleases. He is also eligible for an allowance from the benevolent fund should he require it, the amount to be fixed by the committee. A member who recently reached the age of seventy had over £76 standing to his credit. The society is really a savings bank, an insurance and benefit society combined. The number of members at the end of the last financial year (January 10) was six hundred and eighty-two, being three hundred and seventy-nine higher scale and three hundred and three lower scale members; sixty-four have joined since, and eight have died, the total benefit members at the time of the recent annual dinner being seven hundred and thirty-eight. The voluntary convalescent fund, which was started a few years ago by Mr. Sherwood, is very useful, enabling members to obtain a change of air and scene after sickness. The committee may grant assistance to members from this fund, all cases to be recommended by a duly qualified medical practitioner. Mr. W. Collins is the secretary, and we gladly publish his address—8, Martindale Road, Balham, S.W.

Names of Plants.—E. C., Croydon: Lælia Perrini; Oncidium crispum; the dendrobium was so much damaged that we cannot say whether it was D. bigibbum or a small D. Phalsenopsis, most likely the former.

J. M., Nottingham: 1, Selaginella hæmatodes; 2, S. cæsia; 3, S. suberosa; 4, S. Kraussiana aurea; 5, S. Kraussiana; 6, S. canaliculata.

I. C., Bath: Yes; Cymbidium giganteum, good form.

Names of Fruit.—J. D., Galloway.—1, American Mother, unquestionably; 2, not recognised, may be a local variety.

F. A. R., Royston.—1, not recognised, though somewhat like a small Hollandbury: does it grow larger? 2, Reinette Grise.

C. G., Winford.—1, Reinette du Canada; 2, Loddington Pearmain; 3, Hawthornden.

F. E., Warnham.—1, Madresfield Court Muscat; 2, Duchess of Gloucester; 3, Olivier des Serres; 4, Beurre Bosc.

J. G., Chadwell Heath.—1, Marie Louise d'Uccle; 2, Uvedale's St. Germain.

Balham.—Please send name and address next time. 1, Dumelow's Seedling; 2, Winter Nelis; 3, Easter Beurre; 4, Lord Derby; 5, Lord Lennox.

H. C., Dorking.—King of the Pippins.

D. B., Merton.—1, Round Winter Nonsuch; 2, Waltham Abbey Seedling; 3, Ribston Pippin; 4, Cellini.

E. C. R., Derby.—1, Ringer; 2, Mère de Ménage; 3, Baumann's Red Winter Reinette; 4, Gravenstein; 5, Lamb Abbey Pearmain.

P. D., Swanley.—1, Mère de Ménage; 2, Tower of Glamis; 3, King of the Pippins; 4, Egremont Russet.

R. O. A., Hemel Hempstead.—1, Thompson's; 2, Marie Louise; 3, Duchess d'Angoulême; 4, Vineuse

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, NOVEMBER 14.—National Chrysanthemum Society. Meeting of the Floral Committee.
TUESDAY, NOVEMBER 15.—Leeds Chrysanthemum Show; Two days
  Folkestone Chrysanthemum Show; Two days.
  Winchester Chrysanthemum Show; Two days.
  Ipswich Chrysanthemum Show; Two days.
  Brighton Chrysanthemum Show; Two days.
  Hartlepools Chrysanthemum Show; Two days.
  Belfast Chrysanthemum Show; Two days.
  Chester Chrysanthemum Show; Two days.
  Stirling Chrysanthemum Show; Two days.
  Great Yarmouth Chrysanthemum Show; Two days.
  Liscard Chrysanthemum Show.
WEDNESDAY, NOVEMBER 16.—York Chrysanthemum Show; Three days.
  Hull Chrysanthemum Show; Two days.
  Bristol Chrysanthemum Show; Two days.
  Banbury Chrysanthemum Show; Two days.
  Faversham Chrysanthemum Show; Two days.
  Tonbridge Chrysanthemum Show; Two days.
  Lewes Chrysanthemum Show; Two days.
  Rugby Chrysanthemum Show; Two days.
  Birkenhead and Wirrall Chrysanthemum Show; Two days.
  Chelmsford Chrysanthemum Show; Two days.
  Blandford Chrysanthemum Show; Two days.
  Chippenham Chrysanthemum Show; Two days.
  Reading Chrysanthemum Show.
THURSDAY, NOVEMBER 17.—Edinburgh Chrysanthemum Show; Three days.
  Manchester Chrysanthemum Show; Three days.
  Norwich Chrysanthemum Show; Three days.
  Barnsley Chrysanthemum Show; Two days.
  Lincoln Chrysanthemum Show; Two days.
  Aylesbury Chrysanthemum Show.
FRIDAY, NOVEMBER 18.—Stockport Chrysanthemum Show; Two days.
  Bolton Chrysanthemum Show; Two days.
  Broughton-in-Furnes Chrysanthemum Show.
  Wrexham Chrysanthemum Show.
SATURDAY, NOVEMBER 19.—Batley Chrysanthemum Show.
  Bush Hill Park Chrysanthemum Show.
  Arbroath Chrysanthemum Show.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY, NOVEMBER 14, 15, 16, 17, AND 18.—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

MONDAY AND TUESDAY, NOVEMBER 14 AND 15.—Great Unreserved Clearance Sale of Superior Nursery Stock and Fruit Trees, Messrs. Protheroe and Morris, at the Rutland Park Nurseries, Perry Hill, Catford, S.E.

WEDNESDAY, NOVEMBER 16.—Japanese Lilies, Palm Seeds, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

FRIDAY, NOVEMBER 18.—Imported and Established Orchids, Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

MONDAY, WEDNESDAY, AND THURSDAY, NOVEMBER 14, 16, AND 17.—Bulbs, Shrubs, Plants, Trees, &c.—Mr. J. C. Stevens, King Street, Covent Garden.

NEARLY EVERY DAY.—Tulips, &c., Mr. J. C Stevens, King Street, Covent Garden.

CATALOGUES RECEIVED.

W. CLIBRAN AND SON, ALTRINCHAM.—Trees and Shrubs.
WM. PAUL AND SON, WALTHAM CROSS.—Trees and Shrubs, Fruit Trees.
H. CANNELL AND SONS, SWANLEY.—Autumn Catalogue.
CHARLES TURNER, SLOUGH.—Roses, Fruit Trees, &c.
JAMES WALTERS, WONFORD ROAD, EXETER.—Roses, &c.
J. AND W. WOOD, STOURBRIDGE.—Hot water apparatus.
B. R. CANT, COLCHESTER.—Roses.
W. CUTBUSH AND SON, HIGHGATE, N.—Carnations, &c.
G. W. PIPER, UCKFIELD, SUSSEX.—Roses.

MARKETS.

Covent Garden.

THERE is a fairly good supply of most fruits and vegetables, and the demand is brisk. Green vegetables are inclined to be dear, and potatos remain firm. The best oranges and tomatos meet a brisk demand at good prices.

FRUIT.—English apples, 3s. to 9s. per bushel; Nova Scotian, 12s. to 25s. per barrel; French pears, 3s. to 5s. per case, 7s. to 12s. per crate; Californian, 4s. 6d. to 6s. 6d. per half-case; English grapes, 9d. to 2s.; Channel Islands, 6d. to 1s. per lb.; Almeria, 10s. to 16s. per barrel; Spanish melons, 5s. to 7s.; pomegranates, 4s. 6d. to 6s. 6d.; oranges, 10s. to 20s.; lemons, 12s. to 25s. per case; bananas, 5s. to 9s. per bunch; pineapples, 2s. to 5s. each; peaches, 3s. to 10s. per dozen; English tomatos, 3s. 6d. to 4s. 6d.; Channel Islands, 2s. 6d. to 3s. 6d. per 12 lb.; cobnuts, 40s. to 45s. per 100 lb.; English walnuts, 3s. 6d. to 4s. 6d. per bushel; Grenobles, 5s. to 6s. per bag.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 5s. to 8s.; tea roses, 6d. to 1s.; pink roses, 3s. to 4s.; red roses, 1s. to 2s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, 6s. to 9s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; and pelargoniums, 4d. to 6d. per dozen sprays.

SAVE HALF THE COST.

GARSIDE'S BEDFORDSHIRE SILVER SAND

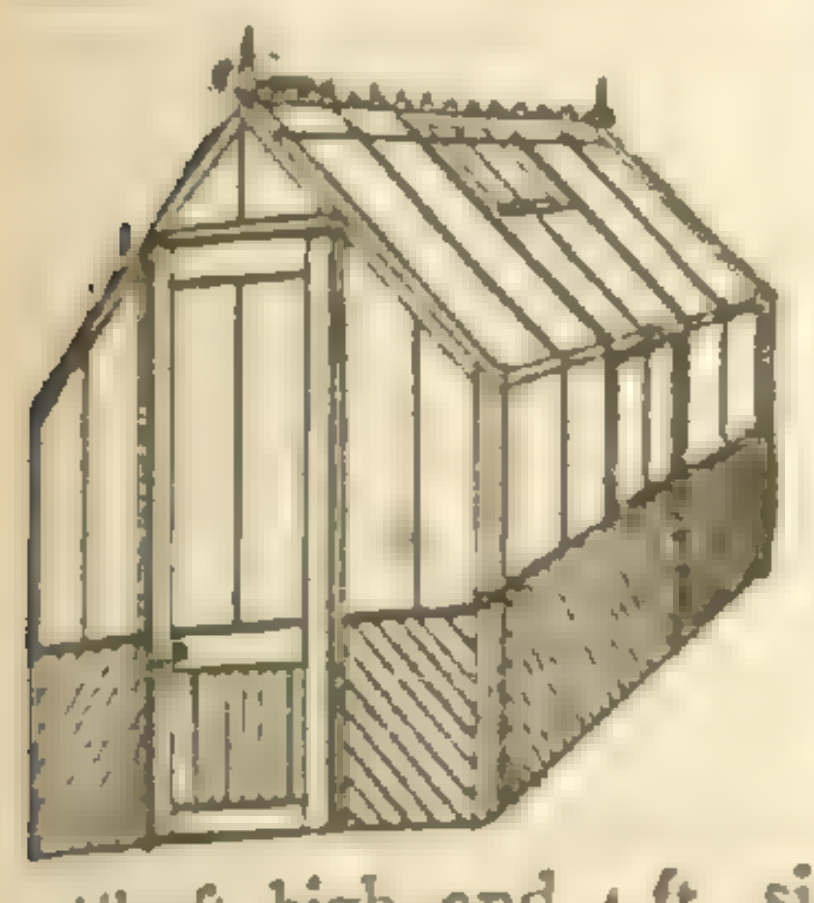
COARSE OR FINE) is admitted by the leading Nurserymen to be **THE BEST QUALITY** obtainable in the trade. Consumers should **BUY DIRECT** from the owner of these celebrated and extensive Pits, which contain a practically inexhaustible supply of splendid Sand, and thus *save half the ordinary cost.* APPLY DIRECT TO THE PROPRIETOR FOR SAMPLES AND PRICES free on rail or canal. All orders executed with the utmost promptness and under personal supervision. Special railway rates in force to all parts. All kinds of PEAT supplied at lowest possible prices. Sample bag sent on application.

GEORGE GARSIDE, Jun., F.R.H.S., LEIGHTON BUZZARD, BEDS.

SURPLUS STOCK ONLY

AT THESE PRICES.

21-oz. glass throughout. Extra strong woodwork. Send for list, containing full specifications. Wherever you buy insist on having a full and complete specification of what you are going to receive. A comparison will then show that these goods, low though the prices are at first sight, in reality are much cheaper still, because so much more substantial. Do not accept vague statements, and take the rest for granted, but insist on knowing definite dimensions of material. The appearance of these houses is also much improved by having the boarding diagonal and more sealed (we have still a few of the lighter make left, prices proportionately lower). All goods on approval with pleasure. Sample end first if desired. Special arrangements for carriage. It will please others if you buy elsewhere, it will please you if you buy from us. So please yourself!

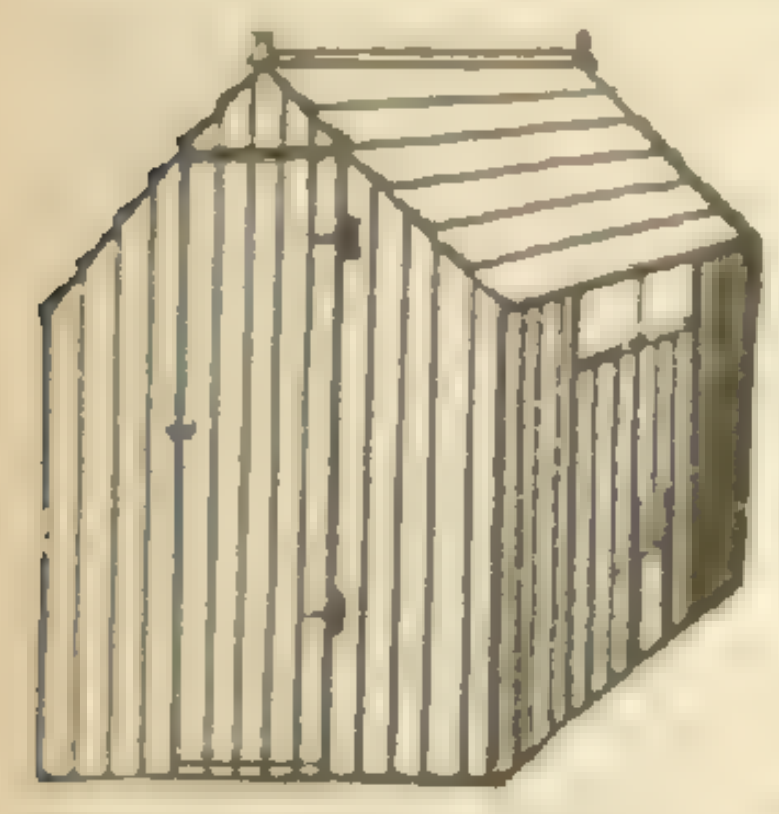


Size.	Lean-to.	Span.
8 X 5	36/-	48/6
10 X 5	48/6	58/6
14 X 6	58/6	78/6
10 X 8	58/6	72 6
14 X 8	78/6	95/-
14 X 10	95/-	£5/7/6
20 X 10	£5/17/6	£6/17/6

All 7 ft. high, and 4 ft. sides (a few 5 ft. sides, trifle more). Ironwork, staging, and one coat paint included.

A comparison:—
£3/10/0 buys elsewhere 8 X 5 lightest possible make.
£3/12/6 buys from us 10 X 8 extra substantial make.
All sizes are in proportion. Need we say more?

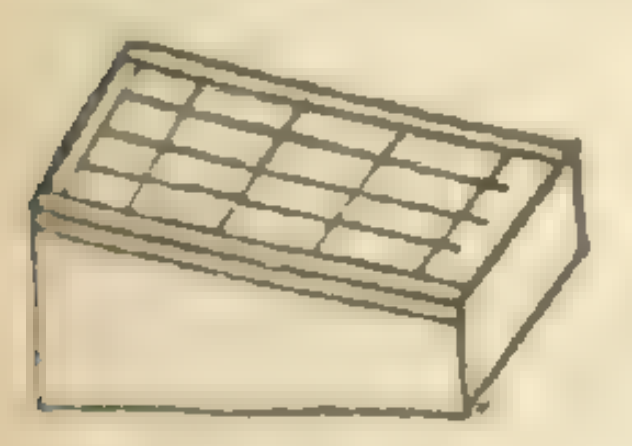
Speculate in a sample end, and set your doubts at rest.



To hold.	Size.	Lean-to	Span.
Ten	4 X 3	10/9	12/9
Twenty	5 X 4	12/9	16/6
Forty	7 X 5	17/6	22/6
Hundred	12 X 7	—	33/-

(Also a few cheaper ones left.)

Usually made from half-inch wood, these are one-third thicker, and felt cover to roof.



4 X 3	8/9
6 X 4	14/6
8 X 6	22/6
12 X 6	33/-

21 oz. glass, strong lights (a few cheaper, 4 X 3 & 6 X 4 left).

A. J. WILLMOT,
WITHYCOMBE, EXMOUTH, DEVON.

CHRYSANTHEMUMS.

BEST RESULTS

Are obtained by starting with healthy country-grown Plants and Cuttings. To prove that GODFREY'S STOCK IS SECOND TO NONE it is only necessary to point to the fact that he has been awarded in one season more Certificates by the National Chrysanthemum and Royal Horticultural Societies for Exhibition Japs than *all other trade growers combined.*

Every bloom so certificated was grown in the Exmouth Nurseries, and had not been "put to be grown," as many frequently are by Chrysanthemum Specialists. Further comments are needless.

CATALOGUES.—Godfrey's Descriptive Catalogue should be in the hands of all, amateur or expert. It contains more *Practical, Reliable, and Interesting matter than any other published.* Post free.

GIVEN FOR

CHRYSANTHEMUMS

ONLY

At the N.C.S. SHOW, held at the Royal Aquarium, November 8th, 1898.

CANNELL'S CHRYSANTHEMUMS.

Come and See.

AN enormous amount of evidence confirming our special system, first adopted by us for propagating from properly prepared stock, from pure, clean, healthy, open-field grown stools, free from fungi, has come to light, and is still coming and proving more and more that ours are far the best, the key to success, and win more victories than, perhaps, all others put together.

Please remember our forte and aim is stock of the best quality, carrying satisfaction all over the world. The following is unmistakable:—

"H. CAHILL, Esq.,
"14, Bowen Street, Melbourne, Australia
"October 10, 1898.

"I am delighted to say the chrysanthemums arrived in splendid condition, every one alive and growing beautifully, whereas those sent out by a friend's care are a total failure. We consider your sending a marvel."

H. CANNELL and SONS, SWANLEY, KENT.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

DO CHRYSANTHEMUMS WEAR OUT?

THOSE who fully appreciate the charms of the incurved chrysanthemum in its highest attribute of beauty can hardly have observed otherwise than with feelings of regret the inferior position which the Queen of England and the varieties that have originated from it as sports have occupied at the exhibitions held this season. A few years since these varieties so greatly predominated in the stands of incurved blooms that it was feared they would check the cultivation of the smaller but beautiful forms that had for so many years given pleasure to those who had a predilection for the section. Now they have fallen so low in the favour of exhibitors that they are sparingly shown, and so inferior in size as to be invariably given a place in the second or front row, instead of in the back row, where until recent years they were almost invariably found. The paucity and inferiority of the blooms of the varieties forming the Queen group have naturally been much discussed by the more observant of those who take an interest in chrysanthemums, and a considerable difference of opinion has found expression. It has been suggested to us that the decline in their popularity is due to their having been superseded by more recent introductions. Were we to accept this view of the case as correct we should require some explanation of the small size and inferiority of the blooms staged even by successful exhibitors; but, with one or two exceptions, the newcomers are so distinct that no proper comparison can be instituted. Being unable to admit that they have been superseded, we must look for some other cause, and some, whose opinions are deserving of respectful attention, regard the degeneracy of the varieties in question as simply a case of wearing out. They contend that as varieties are artificial productions, and can only be propagated by means of cuttings and division, they gradually lose their vigour, and eventually perish from loss of vitality. But there is no evidence forthcoming in support of this opinion that will bear the test of careful examination. We know, of course, that varieties of the chrysanthemum, as of other plants raised from seed saved from the same parent, will differ materially in constitutional vigour as in other points. We are also fully aware that those with a weakly constitution will succumb to unfavourable conditions more quickly than will those with a robust one. But these facts do not support the views of those who believe that varieties, like individuals, die out at a period determined by their initial vigour; they simply show there is a difference in the constitution of plants as of animals, and that the least vigorous of the varieties suffer more quickly from unfavourable conditions than do those endowed with a high degree of vitality. It would be an easy matter to show that the theory of wearing out of varieties, which was first proposed by Knight at the end of the last century, is not based on fact; but the scope of this note will not admit of this being done. Suffice for the present to submit that the decline in the Queen group is not due to the introduction of superior varieties, or to their old age, but to the unfavourable conditions under which they have been placed consequent on the changes that of late years have been made in the methods of procedure. In consequence of the undue preference shown by the majority of judges and exhibitors for big blooms, the plants have received such excessive supplies of fertilisers as to become in the course of a few years more or less diseased. It follows as a matter of course that when a plant becomes unhealthy a cutting taken from it will carry the disease with it, and this will continue as long as successive generations are exposed to the influences which originally caused the unhealthy condition. It is, therefore, obvious that before we can hope to see the Queen, and the several sports obtained from it, reinstated in the position so worthily occupied judges must give proper importance to high quality and exhibitors adopt a more rational course of culture.

LEAVES.

NOW that the leaves of deciduous trees and shrubs have fallen, or are in the process of falling, we may well devote a little consideration to their innate beauty, while we recall the two phases of their outward loveliness which have been enjoyed by us in summer and autumn. We may indeed say three phases, for the spring development has its own peculiar loveliness, which is as distinct as possible from the other two, though it grades into the maturity of summer verdure without that comparative suddenness of change witnessed in the autumn. In the spring we see the leafless branches and twigs of deciduous trees breaking forth into an infinite variety of buds, every species having its own peculiarities, both in the protecting shields which have guarded the latent bunches of incipient leafage all through the winter, and in the method by which this shield is broken through as its contents burst it to greet the cheery glimpses of the sun. It is then that the utmost delicacy of verdure is seen, when first the tiny leaves, which, small as they are, usually display on examination all the detail of the matured leaf, at which stage they arrive by the expansion and multiplication of these little formative cells. Thus the horse chestnut has no sooner spread its plumage out, freed from its shiny black husk, than it is seen to expand and inflate itself precisely as do the wings of butterflies and moths on emerging from the chrysalis. Other forms of leafage act in different ways, and emerge as mere points of growth which do all their elaboration afterwards, and between these two extremes lie all grades, each one with beauties of its own. Under April sunbeams and showers one and all speedily transform their particular skeleton of boughs and branchlets into a vast community of living and breathing and hardworking individuals which we call leaves, and it is the function of these individuals to extend the empire of their particular species both by strengthening the constitution of their own community, the tree or shrub which bears them, and by sending out far and wide their little ambassadors, the seeds, to form colonies abroad. All this is done by the leaves, which we too often regard as mere appendages to the plant, just as we regard the coral insects as mere fringes to the reefs they construct and maintain. The flowers are nowadays recognised at their true value as leaves which have modified themselves in a myriad ways to fulfil the general purpose aforesaid, propagation, and in so doing have enriched the world with a beauty of colour and form which, though appreciated by man, is by no means designed particularly for his delectation, except in so far as he has had a hand in selection, as well as bees and beetles, and so forced his tastes into recognition as well as theirs. In all ways leaves are wonderful. If we pick up and study one of the dead ones now scattered around us—it matters not to what species it may belong—we cannot fail to be struck by the delicate and purposeful architecture displayed in its structure, and, taking up one after another, the variety of plan will also appeal to us as equally astonishing. The tiniest blade of grass and the most ornate and decompound leaf are each as perfect as the other, the strength being distributed exactly where it is needed, and no provision omitted for that subtle intercourse between cell and cell, and between that particular community of cells and its supporting twig and branches, trunks and roots, which is essential for the general wellbeing. Take the first leaf to hand, scrutinise it well, and all that we have said will be seen to be but a mere fingerpost to a myriad marvels.

PEARS FOR PLANTING.

PEARS are such delectable fruits that it is difficult to have them in too great an abundance, provided the supply is so arranged as to extend over the longest possible period, or, to be more exact, from August until the following March. There is no dearth of early, mid-season, and late varieties; on the contrary, the number available in each season is in excess of the requirements of the largest garden. There is, however, so great a difference in the productiveness of the immense number of varieties in cultivation that unless the planter selects with great care he may fill his garden with trees of which a small proportion only will give a satisfactory crop. At their best pears are somewhat uncertain, consequent on their susceptibility to unfavourable climatic conditions when the trees are in bloom, and when the fruits are passing through their first stage, and therefore it is essential to select varieties that can be depended upon to bear a crop in seasons not specially unfavourable. Pears differ also in quality, and, as a small proportion only of the varieties that have been introduced can properly be described as first class, it is necessary to guard against the selection of varieties of indifferent quality by planting those known to be richly flavoured when grown under ordinary conditions. In view of these facts, the reports from our numerous correspondents on the pears giving the best results, that we published in a recent issue, are of much value, and intending planters will act wisely in taking full advantage of the information they contain. To render this task as easy as possible, and to still further assist those readers who have not had widely extended experience in fruit culture, we have extracted the names of the varieties that were described as being the most satisfactory in the largest number of instances, for the purpose of pointing out the season in which they are available for the table, as it is important there should not be a preponderance of varieties ripening at any particular period during the autumn and winter. Commencing in the order of ripening, we have first the Jargonelle, which is the best of the August pears, more especially in the North of England, where, with the shelter of a wall, it attains a high degree of perfection. Following this fine old variety we have Dr. Jules Guyot, Souvenir du Congrès, and Williams' Bon Chrétien. These might well be taken in the order of their names, for Dr. Jules Guyot is a much finer pear than Williams' Bon Chrétien, and Souvenir du Congrès is of special value. For use during October and November, Beurré Bosc, Beurré Hardy, Beurré Diel, Beurré Superfin, Durondeau, Emilie d'Heyst, Louise Bonne of Jersey, Marie Louise, and Pitmaston Duchess are of a high degree of utility, and will afford an ample supply during the two months. To follow the foregoing, Bergamotte d'Esperen, Doyenne du Comice, Easter Beurré, Glout Morceau, Josephine de Malines, and Winter Nelis are prominent among the varieties enumerated by our correspondents. So much depends upon the district and soil in which they are grown, and also the season, that it is difficult to state exactly the date of the ripening of their fruit, but for all practical purposes it will suffice to state that, generally speaking, they will maintain a supply during December and the three following months. In addition to these we would suggest President Barabe as deserving of a widely extended trial. The variety has been grown in the Gunton Park gardens, one of the best known of the Norfolk establishments, for several years past, and Mr. Allan has found it one of the most productive of varieties in a comparatively large collection, and the fruit, which ripens during February, is unsurpassed in quality.

Diploma for the Victoria Medallists.—The sixty leading horticulturists of Great Britain and Ireland who were recipients of the Victoria Medal of Honour in Horticulture, instituted by the Royal Horticultural Society in 1897 to commemorate the sixtieth year of her Majesty's reign, have now been presented with a diploma verifying their title to the use of the now well-known letters V.M.H. We need not here enumerate the medal-holders, as the portraits of the whole sixty were published in the GARDENERS' MAGAZINE of November 20, 1897. The diploma is surmounted by the Royal Arms and reproductions of the obverse and reverse of the Victoria Medal. Then follows, with the name of the holder inscribed:—"Royal Horticultural Society, Founded 1804. Incorporated by Royal Charter 1809. Anno Domini MDCCCXCVII. Whereas it has graciously pleased Her Majesty the Queen, Empress of India, to assent to the establishment by the Royal Horticultural Society of the Victoria Medal of Honour in Horticulture, in perpetual commemoration of the 60th year of Her reign. This is to make known that we, the President and Council of the Society, have conferred the said medal upon our right worthy Fellow *George Gordon*. Given under our Common Seal, this 26th day of October, 1897. Signed Trevor Lawrence, President. W. Wilkes, Secretary." At the foot of this diploma, which measures 16½ by 12½ inches, is affixed the seal of the society.

Edinburgh Chrysanthemum Show.—A magnificent exhibition is that now being held in the Waverley Market, Edinburgh. The competition is exceedingly keen in all classes. The City of Edinburgh prize of £15 and a piece of plate, value £20, for twenty vases of chrysanthemums, distinct, is well won by Mr. T. Lunt, gardener to G. Stirling, Esq., Keir, Dunblane, with the finest exhibit seen this year. Mr. D. Nicoll, gardener to J. W. Bell, Esq., Rossie, Forgandenny, second; Mr. A. Haggart, Moor Park, Ludlow, third; Mr. J. Beisant fourth. Mr. T. Lunt also won first prize for thirty-six Japanese with a fine exhibit; Mr. Addison, Black House, Skelmorlie, second; Mr. J Martin, Comdean Hall, Gloucestershire, third; Mr. Haggart fourth. Plants are grandly shown, Mr. G. Thomson, Preston Grange, Prestonpans, Edinburgh, being very successful.

The Pollination of Flowers by Birds, according to Dr. F. Johow, of Berlin, occurs in a much smaller degree than is generally believed and stated. He shows that humming birds in particular, since they feed entirely on insects, and not on nectar, play but a small part in the carriage of pollen. He describes, however, an unquestionably ornithophilous flower in a Chilian Bromeliad, Puya chilensis. The "nectar" in this flower is exceedingly abundant, but is not attractive to insects, being very watery, and containing but little sugar. It is, however, eagerly drunk by humming birds, but more especially by the Chilian starling, and these birds get their heads plentifully besprinkled with the pollen, which they then carry to other flowers.

New Public Parks and Gardens are continually being made, and the Editor of the "Gardening Year-Book" (148 and 149, Aldersgate Street, E.C.) will be greatly obliged by our readers sending particulars of any new open spaces that may have come under their notice.

Scab on Potatos.—Some diseased potatos recently placed before the R.H.S. Scientific Committee were referred to Mr. Worthington G. Smith for examination, and he has reported as follows: "Almost simultaneously with receipt of specimens from the Scientific Committee other specimens were received from Dr. Masters. Both sets of material showed a well-marked form of 'scab' involving the tip or growing end of every tuber. Freshly cut sections showed a mycelium inside the tubers, both in discoloured and normally coloured parts. The first result of cultivation was an abundant crop of a mucor (white mould), which soon passed into the zygospore resting stage. An abundant crop of bodies of a fungus nature were also present about this time in active growth. Later several other fungi appeared. The rotten parts showed the presence of bacteria, white mites, and nematode worms. Phytophthora was not met with in course of the examination. The 'scab' disease has been ascribed to (1) various fungi, (2) bacteria, (3) nematode worms, (4) mites, (5) an organism of a slime-fungus nature (Pseudocommis). The material examined was not suited to discriminate the actual cause of the disease, because four of the above agencies were present in company. The presence of a fungus mycelium in freshly exposed sections inclines me to give the precedence to some fungus. In the cases examined moss litter from a stable was used largely in one case; the other had also been manured with moss-litter manure, but the source and quantity are not stated. This would seem to indicate that such manure offered good nourishment to the fungus. Comparing my results with other cases recorded, I am inclined to think that the fungus (another cause) came from the soil. Investigations on potato scab have been often made in the United States, Belgium, Germany, and France. No definite cause has as yet been fixed on, but experiments in preventive treatment have been fairly successful. Of the latter, the following have been tried in the United States and in Europe: 1. Corrosive sublimate—the favourite treatment in the United States. When seed tubers are treated before planting out with 1 part sublimate in 1,000 of water for one or two hours good results generally follow, although some experiments on badly infested land were negatived. 2. Sulphur—also an American favourite. The seed tubers are thoroughly dusted with flowers of sulphur before planting. One authority speaks highly of good results from 300 lbs. sulphur per acre applied in the open row, like artificial manures, from a drill distributor. The same writer is also in favour of a mixture of sulphur and kainit at the rate of 300 lbs. per acre. 3. Kainit, for application to land known to be infested. This seems to me a safe cure, and it is favourably reported on."

Asparagus from the Sahara.—It is within the bounds of possibility that our neighbours across the Channel may obtain their earliest supplies of the succulent asparagus from the Oued Rir' region of the Sahara Desert, where the South Algerian Agricultural Society has created three oases and centres of colonisation. The Date Palm is the plant it is most desired to grow, and, owing to the subterranean watercourses, considerable success has attended the efforts made. Figs, apricots, vines, and pomegranates have been cultivated, but their produce is unsatisfactory; the banana, peas, potatos, and beans have been failures. Among the forest trees planted the eucalyptus has done the best, after being protected in its earlier stages. The greatest success achieved so far has been with Argenteuil asparagus, at Ayata and Sidi-Yahia; its culture was commenced in 1892, and some difficulty was experienced in keeping the plantations free from couch grass. When in full bearing it became possible to cut asparagus of the finest flavour over a period of from twenty-five to thirty days. The difficulty, of course, will be to market the produce in good condition. At present it takes five or six days to reach Paris from Ayata; consequently, owing to the expected increase of the yield there, various methods of packing will be tried, so that the transport difficulty may be overcome as nearly as possible.

Dimorphic Leafage on Lavender.—Dr. Masters called attention, at the recent R.H.S. Scientific Committee, to sprays of lavender on which the majority of the leaves were small, grey, with stellate hairs, and with inrolled margins, these characters being acquired by many plants frequenting arid and hot regions. Some of the leaves, however, were much larger, dark green and flat, such being characteristic of plants in a moister climate. The different appearance of the latter is caused by there being much fewer hairs, and these, instead of having long and very slender branching rays, have only extremely short ones, with scarcely any branches; consequently they scarcely overlap each other, and so reveal the green chlorophyll below and between them. With regard to the stomata, they are about equally and very sparingly distributed. They occur on both sides of the leaves.

The Biology of Ferns, though studied carefully of late years by many skilful botanists, is still a subject in which a great deal remains to be explained; thus the student has a wide field here for investigation. Dr. Aurelio de Gasparis, an Italian professor, has, however, recently brought forward a good deal of new information anent ferns. Some of his observations show that there are certain forms of dissemination not previously observed, others relate to the trophilegic action of the fronds, in connection with which certain arrangements have been observed, destined to facilitate the passage of water to the roots. Dr. Gasparis has also discovered two new cases of myrmecophily, as well as a number of instances of acarophily among ferns, many of them very evident and easy of observation.

Where Fruits Pay Like Gold Mines.—Upon the authority of Mr. A. F. Coleman, of Corning, the *National Nurseryman* publishes some very interesting facts and figures anent the fruit industry in the Ozark Region, along the fertile Port Arthur Route from Kansas City to the Gulf. Although the fruit business is yet in its infancy here, some remarkable results have been obtained. Thus, three hundred carloads of strawberries were shipped in the summer of 1897 from one section and brought into one town £52,083. One grower, Mr. Davidson, had had strawberries that paid £62 10s. per acre; another sold peaches for more than £72 per acre; one hundred and sixty acres of four year old peach trees produced

£3,125 worth of peaches. One grower sold peaches at over £62 10s. per acre, while another made over £20 clear per acre off his berry patch. Forty acres of apple orchard, nine years old, realised £500 for the crop on the trees, while one big grower has four hundred acres of apple trees that brought him £6,250 for the crop on the trees, the trees being nine years old. All these things can be had, by men of push, without loss of home and home pleasures, with none to molest or make afraid along the Port Arthur Route. Many sold their apple crop this year for more than they asked for their whole farms a year ago. Mr. Coleman's figures almost tempt us to pack up and take Charles Kingsley's advice to "Go West."

Artificial Garden Manures and their general usefulness forms the subject for discussion at the next fortnightly meeting of the Royal Horticultural Society to be held at the Drill Hall, Westminster, on Tuesday, November 22. Mr. A. D. Hall, of the Wye Agricultural College, will open the discussion by reading a paper on this interesting matter. The committees meet as usual at twelve o'clock, and the meeting closes at four p.m.

The Sherwood Cup for Vegetables.—A handsome silver cup, valued at £10 10s., is offered by Mr. N. N. Sherwood for competition at the R.H.S. meetings of June 13 and September 16, 1899; for this prize vegetables alone are to be staged by either amateurs or gentlemen's gardeners. Apparently there is no restriction as to number of kinds and varieties; judging will be by points, and the points obtained by each competitor on each day will be added together for the result. We may add here that the R.H.S. Rose Show of 1899 will be held on June 27.

Cinerarias as Bedding Plants.—An experiment was made at Isleworth last spring, writes Mr. G. Mallett, to ascertain the value of cinerarias as bedding plants; the results were such as to prove their usefulness to a degree hardly anticipated. The varieties experimented with were those of the ordinary garden type of cineraria, chiefly blue in colour, as that was the colour needed for effect in this particular instance. Seeds were sown in October of the previous year, and the resulting seedlings were kept growing slowly throughout the winter in sixty-sized pots, in a frame heated sufficiently to exclude frosts. A bed, moist and cool, was specially selected for them, shaded from strong sunshine, in which they were planted in the following May, and a light shelter was provided for them on the two or three frosty nights which occurred immediately after planting. Growth was rapidly made when they became established, and they commenced to flower at the beginning of June; by July 1 they were one mass of bloom, before the ordinary summer bedding plants had commenced to make any show of colour, and they lasted in good condition well into August. The residue of the plants after bedding were planted among some hardy ferns in a shady corner; these, from the coolness of the situation, were retarded somewhat, but when in flower they rendered a dull quarter of the garden very bright and effective. Occasional rains which fell at the time of flowering did not harm the flowers in the least degree, beyond giving them a greasy appearance whilst still wet. This season I am intending to sow seeds in December, with a view of retarding them still more, in order that they may flower at a period free from frosts. The results effected at Kew about three years ago by hybridising florists' forms of cineraria with C. cruenta has given origin to a strain of variously coloured varieties with the habit of C. cruenta, known as Cineraria Kewensis; these are eminently suitable for bedding purposes, from their robust habit and effective height. The trouble of keeping them through the winter is not greater than that demanded by other bedding plants, whilst the effect is almost immediate, and has only to be once seen to be repeated.

Plant Hybridisation and Cross Breeding.—An international conference on Hybridisation and Cross Breeding in Plants will be held at the Chiswick Gardens of the R.H.S. on July 11, 1899, and advantage will be taken at that function to bring together as large an exhibition as possible of hybrid and cross-bred plants, together with their parents (when possible) for comparison. This should prove a most interesting conference and exhibition.

Potatos Blackened by Boiling.—Mr. R. Morse recently exhibited some specimens of raw and cooked tubers of Windsor Castle potato to show the difference, in those cooked, as grown in a garden and in a field. The soil from the field sent was very red with the presence of iron, consequently there was very little doubt that the tannic acid, being liberated by boiling, united with some salt of iron imbibed, producing tannate of iron, the usual ingredients of ink. Beyond being somewhat unsightly, nothing of a deleterious character was present. A similar blackening is of common occurrence in potatos from the peaty soils of Skye, and even preferred by the local inhabitants.

The Crystal Palace Grounds will be open to season ticket holders, during the pleasure of the Board, on Sundays, from noon till dusk. Admission may be obtained on Sundays at the Rockhills, South Transept, Low Level, Penge, and Sydenham entrances. Stockholders were formerly admitted to the grounds on Sundays, but since the absorption of the A stock under the Act of Parliament that came into force on October 15 last this privilege has ceased.

Manurial Value of Road Sweepings.—It must have occurred to many a thoughtful observer that the road sweepings in our large and well-paved cities must possess a high manurial value, and that this material should be utilised for increasing the fertility of market garden and farm land. The gardener has long since taken full advantage of road scrapings and sweepings, using them in the kitchen garden and elsewhere both for their manurial properties and mechanical action. In the United States the Department of Agriculture has made a most interesting and useful investigation with respect to the value and utility of road sweepings, and it is to be hoped their example will be followed at home. It appears that the fertilising value of the sweepings varies greatly with the nature of the pavements, being practically nothing in the case of material of macadamised roads, and approaching that of good stable manure in the case of material collected on the hand-swept and well-paved streets of crowded cities; but in autumn the quantity and quality of the street sweepings are much enhanced by the falling leaves. The analysis of eighteen samples of street sweepings in Washington showed the following range of percentages: Organic matter, 35·5 and 10·2; nitrogen, 1·18 and 0·17; phosphorus pentoxide, 0·16 and 0·1; potash, 0·5 and 0·08. A pamphlet from the U.S. Department of Agriculture shows that a farmer who uses the sweepings from Atlanta, Georgia, finds one ton of them to be about equal to half a ton of mixed stable manure (two-thirds cow, one-third horse); he has used the sweepings for three years for maize, wheat, oats, rye, and potatos, broadcasting about twenty tons per acre, and his lands have greatly improved. At Norfolk, Virginia, a grower has been using street sweepings for several years, and with much profit, on spinach, cabbage, kale, and potatos; he finds that their effect on the land is much more lasting than that of stable manure. At Pittsburg, Pennsylvania, street sweepings are used very largely in the parks, with excellent results; the material is powerful and quick in its action, and gives a capital growth of grass, while its effect is considered to be more lasting than that of artificial manures.

Music in the London Parks cost the London County Council the sum of £7,476 during the season of 1898. The sum voted was £7,800, and the Parks and Open Spaces Committee has recommended that a similar amount be voted for 1899. During the present year the L.C.C. has paid £3,752 as wages to its own bandsmen and attendants, £3,038 being expended in hiring and subsidising bands.

The Gardeners' Company were entertained a few evenings ago at dinner by the Master, Sir W. Farmer, and at a meeting of the court which preceded the banquet Mr. C. Bayer, of Tewkesbury Lodge, Forest Hill, was admitted to the livery of the company and elected a member of the court, and Mr. W. L. Seyfang, of The Cedars, Maidstone, was elected a liveryman. These two gentlemen were the guests of the evening, and in proposing their health the Master alluded to Mr. Bayer as a most zealous and successful gardener, as the magnificent grapes which he had brought that evening as a present to the company showed. They would be no less pleased to receive Mr. Seyfang into their body, as he also had special claims to admission into their brotherhood as a grower of the finest chrysanthemums. The health of "The Worshipful Company of Gardeners and the Master" was eloquently proposed by the Rev. W. Wilks, and most heartily drunk. During the evening it was announced that the annual scholarships of £25, founded by the Gardeners' Company in connection with the Royal Horticultural Society, were now fully provided up to the year 1902, the gift of the endowment for that year being made at the table by Mr. F. G. Ivey.

Chrysanthemum Miss Alice Byron.—In our issue of November 12 we published the name of the fine new chrysanthemum raised by Mr. H. Weeks, Thrumpton Hall Gardens, Derby, as Miss Nellie Byron. This was an unfortunate mistake, as Mr. Weeks informs us the name should have been Miss Alice Byron.

Extra-Nuptial Nectaries in Myrmecophilous Plants.—To the list of myrmecophilous plants already known to be furnished with what are called "extra-nuptial" nectaries there have now to be added seven or eight other species. These, says *Nature*, have been observed, in the Botanical Gardens at Naples, to possess these glands, which differ from the ordinary melliferous glands in not being associated with the floral organs and being provided for the purpose of attracting ants instead of for promoting fertilisation. The newly-observed cases occur in Cardamine cheledonia, L., Lilium croceum, L., Dyckia regalis and D. remotiflora, a species of Aechmea, Iris fœtidissima, L., and Vicia serratifolia, Koch. The families of Cruciferæ and Bromeliaceæ are thus added to the fifty-eight families previously known to contain species furnished with the glands in question.

The "Bloom" on Fruits and Leaves is a waxy covering that serves several purposes. Professor H. L. Jones, of the Oberlin College, has shown by a series of experiments that this bloom serves to check the transpiration of water. With several forms of Agave, which were tested, the loss from this cause when the bloom was removed was from one and one-third to two and one-third as great as when it was left on the leaves.

Structure of Indigo Seeds.—A curious and interesting discovery has been made by Professor Church while investigating the structure of the seeds of wild indigo plants such as Indigofera linifolia, I. cordifolia, &c. He found that sections of the embryos showed a marbled surface, having brownish patches, due to the colouring matter erythrophyll. On boiling crushed seeds to test for starch none was found, 33 per cent. being albuminoid matters; hence these are the most nitrogenous of all leguminous seeds known. On the solution being left the true indigo blue separates and becomes insoluble. Thus there are two quite independent colouring matters in the same seed. The solution being red, the blue formed a ring round the porcelain vessel containing it.

The United States Potato Crop of 1898 is very slightly above the average of the past ten years. The average yield per acre for that period is 75·1 bushels, while the average for 1898 is 75·2. In 1897 the average yield of potatos per acre throughout the Union was 64·6 bushels; in 1896 it was 86·8 bushels, and in 1895 the enormous yield was 100·7 bushels per acre. Considering that the United States farmers have secured the largest hay crop ever recorded this year, and that the total yield of maize is estimated at 1,927,000,000 bushels, they do not seem to have had much cause to grumble about the weather.

An Old Coin Discovered by a Potato.—Mr. James Finlay, when lifting potatos at Liberton a few days ago, noticed something sharp sticking out of the edge of one. On examination he found the edge of a coin protruding, three-fourths being embedded in the potato. On being extracted it proved to be an Edinburgh halfpenny of 1790.

The Pine Forests of Arizona are of great extent, and in the north-eastern district there are 2,000 square miles of Pinus ponderosa, forming a magnificent forest at an altitude of from 9,000 to 12,000 feet; below 9,000 feet this species does not occur, but junipers, spruce, and Douglas fir grow freely on the lower slopes.

HULL CHRYSANTHEMUM SOCIETY,

November 16 and 17.

DURING the fifteen years that have elapsed since the foundation of this society the exhibitions have attained to so high a degree of excellence that any material advance appeared to be well-nigh impossible; but the gathering on the above dates was in the leading features so far superior to the previous exhibitions that we have no hesitation in describing it as the best of the series of magnificent exhibitions held at Hull. The two great features were formed by the groups, which were fully equal to the high standard of previous years, and the cut blooms, which were not only better than they have been at Hull for two or three years past, but they were, on the whole, the finest that have come under our notice this season, the incurved being considerably in advance of those previously staged at the southern exhibitions. Table decorations were of a high order of merit, and formed a very attractive display. The arrangements, under the direction of Mr. E. Harland and Mr. J. Dixon, the honorary secretaries, were, as is usual at Hull, as near perfection as we can hope for, and it would be difficult to speak of them in terms in excess of their merits. At Hull it has been the practice to have the exhibition buildings cleared at ten a.m., and with this knowledge the exhibitors complete their arrangements and are ready to leave immediately the last bell is rung, and the judges are consequently in a position to commence their duties exactly at ten o'clock. On this occasion the exhibitors of cut blooms were so well advanced that they left soon after the first bell at 9.45 was rung, and three minutes before the hour of ten every exhibitor had left the gun-room, in which the cut blooms are invariably arranged.

CUT BLOOMS constituted an important and highly attractive feature, for the entries were numerous, and the whole of the collections were of a high order of merit. There were four competitors in the class for twenty-four incurved, and the premier award was made in favour of Mr. C. Crooks, gardener to Lady Hindlip, Hadsor House, Droitwich, for the finest stand of incurved blooms that has been presented to public notice this season. The blooms were large, well finished, and of good colour, and included excellent examples of "The Queen" family. The varieties were Lady Isabel, Golden Empress, Madame Ferlat, C. H. Curtis (2), R. Petfield, Jeanne d'Arc, J. Agate, Duchess of Fife, Topaze Orientale, Violet Foster, Empress of India (2), Dorothy Foster, Lord Alcester, Bonnie Dundee, Empress of India, Duchess of Fife, and Brookleigh Gem; Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, was a capital second, his blooms being distinguished by their high quality; Mr. C. J. Hunt, gardener to P. Ralli, Esq., Ashtead Park, Epsom, was third. There was a keen competition in the class for eighteen incurved, and here Mr. R. Walker, gardener to Colonel Clitherow, Hotham House, Brough, was first, with superb blooms; Mr. W. Hotham, gardener to Brantingham, Thorpe, was a capital second; and Mr. Jackson, Waltham Hall Gardens, Grimsby, was third. For twelve blooms Mr. T. Down was first, and Mr. R. Walker second, both staging excellent examples.

There was a strong competition in the great class for twenty-four Japanese, and here Mr. W. Mease was first with magnificent blooms of Mrs. J. Lewis, J. Bidencope, Miss Nellie Pockett, Mrs. G. W. Palmer, Surpasse Amiral, Viviand Morel, Ella Curtis, Mutual Friend, E. Molyneux, C. F. Payne, Madame G. Henry, Mons. Panckoucke, Mrs. W. Mease, Silver Queen, Simplicity, Sec. Fierens, Madame Carnot, G. J. Warren, Mons. Chenon de Leche, and Mrs. Weeks. Mr. J. P. Leadbetter, Tranby Croft, was second with a superb lot of blooms; and Mr. C. Crooks third, with an excellent stand. Mr. J. Backhouse obtained premier honours in the class for eighteen Japanese with blooms remarkable for their superb development. Mr. R. Walker was a close second, and Mr. H. Thompson, Cottingham, was third. Mr. T. Down was successful in taking the first prize for twelve Japanese, and Mr. R. Walker and Mr. Thompson were second and third respectively. For six blooms of one Japanese variety Mr. R. Walker was first with Mons. Chenon de Leche, and Mr. C. Jennings and Mr. J. Backhouse were second and third respectively.

Such classes as large-flowered anemones, reflexed, singles, and pompons, which are not frequently met with in considerable numbers, were superbly shown. Mr. F. Mason, Hessle, was first for twelve anemones with magnificent blooms of Sir W. Raleigh, W. W. Astor, Delaware, Queen Elizabeth, and Enterprise; Mr. W. Mason, Kirk Ella, Hull, was a capital second. The finest board of reflexed blooms was contributed by Mr. R. Walker, and Mr. Bearpark was second. Mr. Waterhouse, Cherry Gaith, Cottingham, had a superb stand of single varieties, and Mr. W. Sinclair was first for pompon varieties.

GROUPS, to which the large hall was devoted, constituted a highly interesting and very attractive feature, and fully sustained the reputation the society enjoys for the excellence of its arrangements of plants. As was the case last year, the finest of the groups of chrysanthemums and ornamental-leaved plants was contributed by the Superintendent of the Public Parks under the control of the Hull Corporation, and the superintendent may be heartily congratulated on the high development of the plants and the taste displayed. Mr. George Wilson, gardener to Sir James Reckitt, Bart., Swanland Manor, Brough, had an exceedingly beautiful arrangement which was placed second to the Corporation group, but as the latter was not eligible for a prize it received an honorary award, and the first prize was awarded to Mr. Wilson, and was well deserved. Mr. G. Jarvis was third in order of merit and received the second prize with a beautiful arrangement. Mr. G. Cottam, Cottingham, was fourth in order of merit and received the third prize, his group also being highly meritorious. The first and second awards for groups of miscellaneous plants were made in favour of Mr. J. W. Wilson and Mr. George Wilson, both of whom had circular arrangements evincing much taste. There was also a keen contest for the prizes for decorated drawing-room mirrors, and the first prize was awarded to Mr. G. C. Coates, Hull; Mr. J. P. Leadbetter was a capital second, and Mr. J. Foster was third.

PLANTS were profusely shown, and on the whole remarkably good, the bush-trained specimens being especially meritorious. The most successful competitors were Mr. H. Thompson, Mr. W. Mason, Mr. H. Clark, Mr. J. Backhouse, Mr. R. Thirsk, and Mr. G. Cottam. Bush-grown and cut back plants consisted exclusively of Japanese varieties, and the glorious masses of flowers produced a rich effect.

TABLE DECORATIONS and other floral arrangements sufficed to fill a large hall, and were of such exceptional merit as to do much credit to the taste of the Hull ladies.

PREMIER BLOOMS in the open classes were, incurved Duchess of Fife, shown by Mr. Cross, and Japanese Monsieur Chenon de Leche, staged by Mr. R. Walker.

Chrysanthemum Mrs. W. Cursham.—In our issue of October 29 a description of the above-named fine Japanese chrysanthemum was given on p. 698. This variety gained a first-class certificate from the N.C.S., but it was inadvertently ascribed to Mr. W. Wells, whereas the raiser and exhibitor was Mr. H. Weeks, Thrumpton Hall, Derby.

NEW PLANTS AND FLOWERS.

PTYCHOSPERMA SANDERIANA.

AN elegant palm, reminding one of both] Cocos Weddelliana and Geonoma gracilis; the fronds are long and graceful, each having a long foot-stalk, thus rendering the plant light and suitable for table decoration; the pinnæ are narrow, and spreading rather than drooping. F.C.C., R.H.S., October 25. Messrs. F. Sander and Co., St. Albans.

DRACÆNA VICTORIA.

A splendid dracæna, somewhat resembling D. Lindeni and D. Massangeana; it has a similar graceful and well-furnished habit, and bears broad leaves of a bright creamy yellow shade with a dark green central band that is again striped with greyish-green. F.C.C., R.H.S., October 25. Mr. W. Bull, 536, King's Road, Chelsea.

TEA ROSE, SUNRISE.

A charming tea-scented rose of strong growth, and bearing dark, richly-coloured foliage, and long-stemmed flowers that are coppery buff with a rosy tinge. Very sweet and pretty. A.M., R.H.S., October 25. Mr. G. W. Piper, Uckfield, Sussex.

CHRYSANTHEMUMS.

Mrs. W. Howe.—This is a very fine incurved variety of large size and great depth. The colour is soft yellow. The florets are pointed and incurve well. F.C.C., N.C.S. Mr. W. Howe, gardener to Sir H. Tate, Streatham.

H. J. Jones.—A grand Japanese variety of somewhat spreading form and having broad, substantial florets that are intense and brilliant crimson on the upper surface and pale bronze on the reverse, though the underside is seldom seen. F.C.C., N.C S., November 14. Mr. W. Seward, The Firs, Hanwell.

Hanwell Glory.—A large and globular incurved variety, with pointed and closely overlapping florets that are of a curious shade of yellowish bronze streaked with red. F.C.C., N.C.S., November 14. Mr. W. Seward, Hanwell.

C. S. Bates.—A large globular incurved variety, its colour being a peculiar shade of golden chrome; there is also a suspicion of orange in the lower florets. The florets do not cup so freely in this as in some forms. F.C.C., N.C.S., November 14. Mr. R. Owen, Maidenhead.

Le Chalonaise, a splendid Japanese anemone of most distinct colour; it is a bold, handsome form, and wholly of a rich and deep yellow, the outer florets tinged with rose, and the splendid disk being of an orange shade. F.C.C., N.C.S., November 14. Mr. H. J. Jones, Lewisham.

John Pockett, a bold incurving Japanese variety of large size, and with very thick, substantial florets that are fully half an inch broad. The colour is dull velvety crimson on the inner surface, but light bronze on the outer and most evident surface. A.M., R.H.S., November 8; F.C C., N.C.S., November 14. Mr. W. Wells, Earlswood Nurseries, Redhill.

Madeline Davis, an extremely pretty Japanese variety, having the lower florets broadened and of a lovely soft rose hue; the more central florets are shorter, twisted, and pointed, and of a softer and paler tint. F.C.C., N.C.S., November 14. Mr. W. H. Lees, Trent Park, Barnet.

Madame Gabrielle Debrie is a huge incurved Japanese with immensely broad pale flesh pink florets; a fine exhibition variety in the way of Louise. F.C.C., N.C.S., November 14. Messrs. H. Cannell and Sons, Swanley.

Mrs. Annie Hills is a magnificent incurved variety of large size, great solidity, and distinct colour, the latter being of a pretty shade of pearly blush. The florets are of fairly good size and pointed, and they incurve well. F.C.C., N.C.S., November 14. Mr. H. Weeks, gardener to Lady Byron, Thrumpton Hall, Derby.

HORTICULTURAL CLUB.

THE monthly dinner and conversazione took place at the rooms of the club, Hotel Windsor, Victoria Street, Westminster, on Tuesday evening, November 8. The chair was occupied by Sir John D. T. Llewelyn, Bart., M.P., chairman of the club. There was a large attendance of members, including the Rev. W. Wilks, the Rev. Joseph H. Pemberton, Messrs. H. J. Veitch (vice-chairman of the club), Edward Mawley, C. Pearson, James H. Veitch, W. Bassett, M. J. Garcia, T. W. Girdlestone, G. Bunyard, W. F. Cooling, R. Gofton Salmond, Selfe Leonard, Harry Turner, and the secretary. The discussion was opened by Mr. T. W. Girdlestone on the dahlia as a garden flower. He reviewed the various sections, and showed how much the cactus dahlia had increased in popularity, and that we might look forward to still further improvements in it. In the discussion which followed, in which most of those present took part, many interesting facts in connection with the flower were brought out, and a hearty vote of thanks was proposed by the chairman to Mr. Girdlestone for his most interesting address.

The Colchester Gold Cup, offered by Mr. William Colchester, of the Chemical Manure Works, Griffin Mills, Ipswich, as the first prize for barley, has been won by Mr. W. Nisbet, Park Gate Farm, Stratford St. Andrew, Saxmundham. The competition was open only to users of the Gold Cup Fertiliser, Griffin Brand, prepared and manufactured at these works, and each ton of Gold Cup Fertiliser used by the purchaser entitled him to enter one sample of the barley grown by its aid. An essential condition was, of course, that no other form of chemical manures should be utilised, but permission was given to use the Gold Cup Fertiliser with or without farmyard manure at the discretion of the grower. It was a noteworthy fact, however, that not one of the entrants used any farmyard manure, but relied wholly upon the fertiliser. A very strong competition took place, entries coming from Norfolk, Suffolk, Essex, Cambridgeshire, Herts, and Kent. The winning sample was Webb's Kinver Chevalier Barley (raised by the Stourbridge firm of Messrs. E. Webb and Sons), grown on medium soil, with a sandy subsoil, the preceding crop in 1897 being beans and peas, and the manure used at the date of sowing, February 28, four hundredweight only per acre of the Gold Cup Barley Fertiliser. The crop was reaped on August 26, and the unanimous opinion of the judges was that the sample was a very excellent first. A diploma went to sample No. 59, entered by Mr. Harry Fulcher, Finningham, grown on a heavy soil, the preceding crop being beet. Mr. Fulcher used three hundredweight of the manure only per acre, the seed being sown in the middle of February, and reaped the middle of August. The third place was taken by Mr. Walter Fallows, Witnesham, who also received a diploma.

PERPETUAL ROSES.

THE most valuable roses for garden cultivation are those which have the characteristic of so-called perpetuality. A very large number of hybrid perpetuals are unworthy of the name. There are many which achieve so much in summer—and among these is the incomparable Duke of Edinburgh—that any attempt to bloom well in autumn is generally unsuccessful. Others, whose first period of flowering is not so protracted as to exhaust their capability, flower with great facility during the autumn months. Among these I would especially commend A. K. Williams, one of the brightest of our dark crimson roses—if such an expression be admissible, as I think it is; its formation is a near approach to absolute perfection, and I think its value can hardly be overestimated, whether as a summer or autumn flowering rose. Before me, as I write, at this late season of the year, are some very fine specimens of this truly inestimable rose; but it has many almost equally charming contemporaries in the vases adorned by its crimson hues, among which are the finely contrasted Margaret Dickson, one of the finest varieties the Newtownards firm has given to the world, as exquisite in its texture, and as commanding in its dimensions, as it was in July. The date at which I am writing is November 3, and the roses I am mentioning, *honoris causa*, were gathered to-day. Associated artistically and most effectively with these are the recently originated Countess of Caledon and Madame Abel Chatenay, which have already proved themselves precious acquisitions; Enchantress, Medea, a magnificent lemon-coloured variety, and Empress Alexandra of Russia, excellent emanations from Waltham Cross; Mrs. W. J. Grant, a notable Irish beauty, which has recently become a naturalized American under the title of Belle Siebricht, but is likely to retain, at least in Great Britain, its original name; Marie Van Houtte, one of the sweetest of tea roses, and Madame Hoste, worthy of a similar description, though both of these varieties, possessing delicate petals, are very susceptible to atmospheric influences, and have of late suffered considerably through the influence of rain. Marquis of Salisbury and Cheshunt Scarlet are still blooming profusely and retaining their fresh fragrance in the absence of the sun. Medea, with closely compacted petals, and the primrose-hued Kaiserin Augusta Victoria, which also is somewhat too closely folded, are heroically striving to unfold their secret charms, with wonderful success. But varieties such as these, with their affluence of petals, require more sunlight to open with facility than at this late period they usually receive.

More successful in the direction of floral development during the late autumnal season are the majority of the teas and hybrid teas. Conspicuous among the former are Madame Chedane Guinoisseau, which, though defective in central fulness, is the loveliest yellow rose, with the exception of Rosa Harrisoni, within the range of my acquaintance, even including the Maréchal Niel, which I regard as quite unsuited, by reason of its delicacy, for open-air cultivation; and Madame Bravy, creamy white, an odorous and most attractive rose, greatly undervalued in comparison with others of more commanding hues, but its exquisite beauty, by its pendulous habit, is largely concealed. Of a different character is the beautiful buff-coloured Anna Olivier, which is among roses what Lilium excelsum is among lilies, with long-shaped, handsome, lightly-borne flowers, one of the finest of autumn treasures, a veritable garden gem. Papa Gontier, which should perhaps be regarded as a hybrid tea, raised by Nabonnand, and introduced into cultivation in 1883, is perhaps the most important of his many bright creations, inferior only in colour to L'Ideal (which is not much of a climbing variety) but superior to it in every other respect. Etoile de Lyon has much the same colour, and many of the attributes, save the limitations, of Marie Van Houtte. Fiammetta Nabonnand, generally supposed to be the result of a cross between Papa Gontier and Niphetos, is a gracefully formed, late-flowering rose. Madame de Watteville flowers easily, but does not grow to its full size in autumn, even when it has been exactingly disbudded. Madame Lambard is very distinctive in its colour, and strikingly prolific even at this late season. Madame Charles is of much more vigorous constitution than Madame Falcot; then there are also Princess Vera and Perle des Jardins. White [illegible] has been condemned as an unsuccessful production; it is, nevertheless, to my thinking, a very fascinating rose, its faintly suggested carmine shading on the yellowish-white petals being finely effective. I must give it a wider circulation in my garden, for I like it much better than Perle des Jardins, which, notwithstanding its richly yellow colour, often comes with abortive, "divided" blooms.
